The American Sardine Co's Boneless Sardines, are much better, and less than half the cost of imported Sardines. apr lyr.

A BOON

To All Who Require Light for Household and Other Purposes.

The Recent production of "Mineral Sperm," together with the peerless Dual Burners for all kinds of lamps, is one of the most important events of the times.

Mineral Sperm Oil is as safe as sperm or lard oil, has no offensive smell, and finer illuminating power than any oil yet produced.

YOU CANNOT EXPLODE IT.

If the lamp should fall and break, the oil would extinguish all flame. One gallon goes as far as two of the best coal oil.

The Burners fit any lamp. Call and see them, at L. H. HOLLOWAY'S, where you will find a complete assortment of Lamps and Lamp Fixtures, and also the completest assortment of Groceries and Provisions, at prices which defy competition.

C. A. HOUCH,

Successor to L. H. HOLLOWAY, who will conduct the business on the same liberal principles and terms as heretofore.

311 Santa Clara Street,

San Jose Bank Building.

BREEDERS' DIRECTORY.

Parties desiring to purchase Live Stock will find in this Directory the names of some of the most reliable Breeders.

OUR RATES.—Cards of two lines or less will be inserted in this Directory at the rate of 50 cents per month. A line will average about eight words. Payable annually.

CATTLE.

COLEMAN YOUNGER, San Jose, Santa Clara county, Cal., breeder of Short-Horn Cattle.

R. G. SNEATH, Menlo Park, San Mateo Co., Cal., choice Jersey Cows, Heifers and Bull Calves for sale

CARR & CHAPMAN, Gabilan, Monterey county, Cal., breeders of Trotting Horses, Short-Horn Cattle and Swine.

R. R. CANNON, Suisun, Solano county, California, breeder of Short-Horn Cattle and Swine.

VOL. 6. SAN JOSE, CALIFORNIA, JANUARY, 1875. No. 1.

Wire in Dried Apples.

EDS. AGRICULTURIST:—Consignments of Alden dried fruits have lately been received by our grocers, which are highly approved of by the house-keepers of San Diego. There is, however, one drawback to the dried apples, and I wish to know if it is an accidental one, incident to the quantity shipped here, or whether it is a usual defect in the preserving process. I find minute pieces of wire about the thickness of medium cotton thread, and from an inch to half an inch in length, imbedded in the slices, necessitating the overhauling of every single piece preparatory to cooking. I think it about as safe to swallow a needle or a pin as one of these slight but tough pieces of wire. A busy housekeeper who has little time to spare grudges the bestowal of so much of it upon a mess of apple-sauce. MRS. J. P. ROWE,
San Diego.

We think that the pieces of wire spoken of by our correspondent must have come there by the scaling off of particles of the wire meshes upon which the fruit rested while drying, owing to the action of the heat of the furnace and acids of the fruit upon imperfect wires. We never before heard of such a thing.

BATTLE MOUNTAIN, Nev.,
December 20th, 1874.

ED. AGRICULTURIST. *Dear Sir:*—Please forward me your valuable paper; enclosed please find price of same. Will you have the kindness to inform me if hogs will do well on raw artichokes, or what general information you may have in relation to feeding and fattening hogs on same. Also, if they will do well, where I can obtain ¼ ton and at what price. Yours Resp'y,
H. C. EMMONS.

We have seen hogs fatten on the ground artichoke on Spoon River, Illinois. The hogs run in the pastures where they were growing, and rooted them up as they wanted them. We do not know where the roots can be obtained nor at what price. Will some reader who has cultivated them here answer and give their experience.

Best Advertising Mediums.

The Agricultural Journals find their subscribers mainly among the best class of the country population. They necessarily employ a good deal of various and special talent, and expend on themselves a larger amount of money than other journals, and must therefore obtain a larger circulation to live and thrive. Thus they form a highly important and influential class of newspapers, and have a peculiar value to advertisers. Perhaps no others are read so carefully and thoroughly, and so much preserved for re-reading and reference.—*Advertisers' Magazine.*

THE mind advances by steps: some men take one, some two, some three.

The San Jose Society for the Prevention of Cruelty to Animals, has just issued from our office, 1,000 Constitutions and By-laws and the Act under which the Society was incorporated. It is a 16-page pamphlet, pocket size with a colored cover, and is published for *gratuitous* distribution. Persons wishing to organize such a society, or feeling an interest in this one should send for a copy. Every humane person must approve of its objects.

Lottery Advertisements.—We have just received two grand schemes for swindling the unweary, and been offered great inducements to advertise the same. We wish there was a simple, plain law against advertising such abominations. No decent paper will do it to be sure. It should be reason enough why a paper should not be patronized by respectable persons when, for money, they will encourage so shameful a vice as the lottery business.

Mr. J. J. H. Gregory of Marblehead, Mass., has his annual advertisement in our columns. He was the original introducer of some of the best vegetables now found on every table. He comes this season with a new squash, and a number of tempting specialties, some of which are finely illustrated from engravings taken from photographs. The fact that so many of his varieties of seed are of his own growing, is a golden fact for farmers and gardeners.

The California State Grange has never authorized or given official recognition to any paper in this State as an organ of the Grange movement. Whatever has been published has been done as private speculation by individuals, at their own discretion. The idea has prevailed that certain papers are Grange organs, and should be respected as such. Patrons should not allow themselves to be humbugged.

Sugar Beets for Stock.

In a paper before the Little Falls, N. Y., Farmers' Club, Harris Lewis said: "I have concluded that the best varieties of the French and German sugar beets are the most nutritious, the most acceptable to the cow, and produce the best flavored milk of all the roots I ever fed. But all these sugar beets go down to the crown in the soil, and cost three or four times as much labor per ton to harvest them as it does to harvest any one of the kinds of beets known as the mangold wurzel. Again, the sugar beets seldom yield more than 20 tons per acre, while the mangold wurzel often yields over 40 tons per acre. I would recommend the large wurzel, such as the Norbiton giant, long mammoth, red, yellow ovid and yellow globe, for general cultivation, as those kinds that will give the greatest yield per acre, and as cattle food, give entire satisfaction to all dairymen or cattle feeders, who may grow and feed them in connection with hay, or other dry forage, during the winter. The more I feed beets to cows the greater value I place upon them, as good, nutritious, health-promoting food.

LOCAL MOVEMENTS IN BUSINESS.

A fine, large, new jewelry store has been opened at 324 Santa Clara street, San Jose, by L. Houriet & Co. It is ahead of anything in San Jose in the magnificence of its appointments and amount of stock.

Business is extending up First street quite rapidly. San Jose seems to be in a prospering condition—more so than for several years past, if we are to judge by the growth of business.

John Rock has opened his yard in San Jose for the sale of all sorts of fruit, ornamental and shade trees, plants and vines, etc., both out of door and green-house. Mr. Henn is his salesman again this season, and the stand is at the same place, near Wells, Fargo & Co's., First street.

Our old friend and partner, Mr. L. H. Holloway, has sold his grocery store to a gentleman named Huff, who takes possession the first of this month. Mr. Holloway goes to San Francisco to engage in the same business in connection with a publication to be devoted to the grocery trade, so we understand.

A new glove factory has opened attractively at 330 First street, under the new Odd Fellows' Hall. This is an enterprise that is bound to succeed, as already the demand for California made gloves has run out the cheap trash that is imported to make money on.

Reform Journals.—Says an exchange: "Journalism in the line of reform is very difficult business. Somebody has to make sacrifices, and generally the last ones who are willing to make them are those who are most to be benefitted by their being made." The reason why this is so seems to be this: the majority of men and women prefer amusement to instruction, and would sooner be flattered in their vices than to listen to reproof or make an effort at correction. It is more convenient to run in the ruts of social opinion than to stem the current in pursuit of something better. The majority of mankind dislike to reason or act out of the narrow circle of conventional ways and ideas.

The Santa Clara Valley Agricultural Society hold an annual meeting for the election of officers on the 7th of this month. An attempt will be made by those opposed to reform to perpetuate the horse racing, and pool selling, and liquor selling features, while those who would see the society conducted with the object of advancing the farmers' interests and not as a horse race, will oppose it. The life membership is $50, which is so high that but few farmers can afford to take memberships. This gives the jockeys, who can, for the "benefits" derived from their "avocations" afford to join, a chance for a majority.

California Agriculturist and Live Stock Journal.

" fourth Column	4 00	"
" eighth Column	2 00	"
" sixteenth Column	1 00	"

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Stock Breeders will find it to their advantage to extend the circulation of this journal. The general farmer who reads its columns must become impressed with the importance of keeping more and better stock. Indeed, the fact that the most important part of a good farm is, or should be its live stock, is one that is worthy of being widely discussed. The very best agricultural writers express themselves in this way, and the very best farmers are the ones who best know how indispensable good stock is upon a farm that produces the maximum of profit.

The Reformer who expects to be appreciated for the efforts he or she may make in behalf of humanity in any direction, or in any cause, is entertaining a fallacious notion, and the sooner their mind is disabused of such dreamings the better. The only real success is in the *accomplishment of good*, and that should be the main thought—self should be least thought of. The reward of philanthropy is enjoyed by those on whom good deeds are bestowed. The giver must depend for his reward in a sublime faith that all must be well that results from well doing; very seldom does a reformer become popular with the masses, the great majority of them, hard working and poor, move through this world without the plaudits of mankind, and frequently more scorned than admired.

We have tried the Ammonia for Washing advertised by D. McKenzie. Wife says it saves one-third the labor and leaves the clothes beautifully white and clean. It dissolves the dirt, and little rubbing is required to cleanse the clothes.

The Grangers' Guide is a new publication of twenty-four pages, published by Bro. Earl, who is an officer of the Grangers' Immigrant Bureau. Although published under the auspices of the Grangers, it is really a private speculation, as much as any other paper. It may have a mission to fill, and it may fill it. The paper makes a very credible appearance, but gives a very glowing and one-sided account of the country. It is published ostensibly to induce immigration to this State, and to show immigrants where homes can be obtained at a reasonable cost. How much of self-interest is involved we are not able to say.

The man who undertakes to establish a manufactory for the production of any article on this coast has got to fight his way against importers and dealers generally. The starch factory that was started in our county some years since, was actually crushed by importing parties who held the monopoly of the trade, through dealers, and who had enriched themselves at the people's expense. The furniture manufactory in San Jose, is an object of special spite, and the importers will do the best they can to kill it. The furniture made at this factory is better than has ever been sold for the same money in San Jose, and we hope that whoever wants such articles as they manufacture will patronise the home factory, in preference to being humbugged with imported goods.

Carl Brown.—San Jose can lay claim to an artist who promises to gain for himself considerable distinction. Mr. Carl Brown came here last Summer at the call of Mr. Brohaskie to paint new style scenery for his theater. The rapidity and excellence with which he brought out new scenery was the astonishment and delight of all theater-goers, and did much to make the "Opera House" popular. Lately Mr. Brown has been painting portraits, which have gained him much credit. He has also painted a battle scene which exhibits a large conception of the ideal. Having settled here, and being of an enterprising disposition, he has, in addition to the use of his pallet, opened a skating rink on the Opera House floor, where the active youth of San Jose can devote some of their surplus vitality to physical development.

The California Agriculturist is *not* moved to San Francisco. It is still published at San Jose, and will most probably continue to be for some time to come. We have had no notion of moving. Although we claim as our field the whole broad land of the Pacific States, yet we are content to call San Jose our home. When it was announced that Mr. G. W. Henning's paper, which he calls the *Granger*, was going to be moved to San Francisco, many persons, owing to similarity in the sound of names, took us for the *Granger* man, and *vice versa*. There has been a good deal of "confusion worse confounded," first and last, since we unfortunately associated his name with ours for two months in 1873. It will be recollected that the *California Granger* was started soon after that short partnership was abruptly ended. When we would not be roped into receiving bribe money for advocating the interest of a political party, and could not be persuaded to give up, at his own terms, our interest in the AGRICULTURIST, which we established, the threat that the AGRICULTURIST should be killed was freely made. We had always objected to making, or attempting to make, the AGRICULTURIST an *organ* of any society or party. We preferred to be free and untrammelled; to discuss any matters in the interests of the farmers with but one motive—the farmers' good. Without authority from the Grangers, but as a catch-word, the name *Granger* was given to Henning's paper. While Henning was in the AGRICULTURIST he put at the head of this journal, contrary to our expostulations, claiming that he had the authority and the right so to do, these words: "The AGRICULTURIST having been recognized as the only organ of the Patrons of Husbandry on the Pacific Coast, we respectfully solicit the aid of the officers of Granges in making it a perfect exponent of the principles and working of the Order," etc. On complaint of the proprietors of the *Rural Press* to the Executive Committee of the State Grange, the Committee wrote to "Herring & Henning," ordering us to take down that announcement as it was made without authority, etc. And they further declared that they desired to recognize no paper as an organ, but trusted to the good will of the whole intelligent press to favorably discuss and advocate the Grange interests. Thi sentiment suited us, and a modest person would naturally think it would have satisfied Mr. Henning. But the first thing he did when we dissolved partnership, was to start the *California Granger*. He might, with as much propriety, have called it the *Grangers' Confidence*. By taking up the popular cry, and assuming a name that would imply authority in Grange matters, our "would-be leader" led off. But now that he has departed from our town to San Francisco to take the wind out of the sails of our old rival the *Rural Press*, we surely ought to be satisfied. It is an ill wind that blows nobody good. We condole the *Rural Press* on their acquisition of such a rival. The *Rural Press* has always given a great deal of Grange intelligence and has been faithful and sound upon all questions concerning Patrons. Its advice has been reliable, and it is a good agricultural as well as Grange paper. We shall be sorry to see the *Rural* demolished although when it is out of the way, we may, by having one less agricultural paper on this coast to contend with, be able to gather a larger harvest of subscribers.

Christmas has passed off, as did Thanksgiving Day, quietly with us, but not the less as a holiday. It was joy enough to see the many happy faces and hear the laughing voices out-welling with kindness. Why cannot the world always be as cheerful? Alas! for the selfishness that takes from our lives so much of good will and joy that might come from well-doing. These holidays come like gleams of sunshine, and if the clouds they rend would only stay away during the whole year, our days would always be happy, and as good as "Christmas and New Year" all the time. Let us all remember that as long as there is a chance to improve it is our duty to progress.

Poetry.

To a Dandelion in January.

Did you make a mistake, my darling?
Did you hear the joy-bells ring,
Deep in the tangle of grasses,
Till you thought it was surely Spring?
And forth, in your winsome beauty,
You stepped with a modest air,
Matching the golden weather
With the grace of your golden hair.

It is not in the least surprising
That a sky so tender as this
Should waken the dreaming flowers
As if with an April kiss.
Indeed, the marvel is only
That all the beautiful train
Violet, snow-drop and lily,
Do not troop hither again.

If we, with our grown-up learning,
Were not so dreadfully wise,
We should certainly think that Summer
Was standing before our eyes;
For here are her glorious colors,
And here is her fervid sun.
Pray, how could you tell, little flower,
Her reign was over and done?

But what will you do when a morning
Shall come to your dwelling-place,
And scowl with a dark displeasure,
Into your laughing face?
Where will you hide in the morning
That shatters your house so fair,
And weaves a glitter of hoar-frost
Over your faded hair?

Not with the touch of April,
Not with the breath of May,
Cometh the chill old Winter,
Her weight on your heart to lay.
My poor little dandelion,
When you heard the joy-bells ring,
Why did you not wait and listen,
And be sure that it was Spring?

Up from the tiny flower
Came a voice as fine as a thread:
I tell you, in such an hour,
I couldn't lie still in bed;
And to see this Indian Summer,
And its light as clear as May,
Is worth whatever may happen
On your dread wintry day.

Courage to Do Right.

We may have courage, all of us,
To start at honor's call,
To meet a foe, protect a friend,
Or face a cannon ball;
To show the world one hero lives—
The foremost in the fight—
But do we always manifest
The courage to do right?

To answer, not with steady breath,
And quick, unfaltering tongue,
When hence temptation, ever near,
Her syren song has sung?
To care not for the hankering tone,
The jest or studied slight;
Content if we can only have
The courage to do right?

To step aside from fashion's course,
Or custom's favored plan,
To pluck an outcast from the street,
Or help a fellow man?
If not, then let us nobly try,
Henceforth, with all our might,
In every case to muster up
The courage to do right.

The Forest Trees.

BY ELIZA COOK.

Up with your heads, ye sylvan lords!
Wave proudly in the breeze;
For our cradle bands and coffin boards
Must come from the forest trees.

We bless ye for your Summer shade,
When our weak limbs fail and tire;
Our thanks are due for your Winter aid,
When we pile the bright log fire.

Oh! where would be our rule on the sea,
And the fame of the sailor band;
Were it not for the oak and cloud-crown'd pine
That spring on the quiet land?

When the ribs and masts of the good ship live
And weather the gale with ease;
Take his glass from the tar who will not give
A health to the forest trees.

Ye lend to Life its earliest joy,
And wait on its latest page—
In the circling loop for the rosy boy,
And the easy chair for Age.

The old man totters on his way,
With footsteps short and slow;
But without the stick for his help and stay,
Nor a yard' length could he go.

The hazel twig in the stripling's hand
Hath magic power to please;
And the trusty staff and slender wand
Are pluck'd from the forest trees.

Ye are seen in the shape of the blessed plow
And the merry ringing flail;
Ye shine in the dome of a monarch's home,
And the sacred altar-rail.

In the rustic porch, the panell'd wall,
In the gay triumphal car;
In the rude-built hut, or the banquet hall—
No matter, there ye are!

Then up with your heads, ye sylvan lords!
Wave proudly in the breeze;
Our cradle bands and coffin boards,
We're in debt to the forest trees.

Backbone.

When you see a fellow-mortal
Without head and fearless views,
Hanging on the skirts of others,
Walking in their cast-off shoes,
Bowing low to wealth and favor
With uncovered, abject head,
Ready to retract or waver,
Willing to be driven or led;
Walk yourself with firmer bearing,
Throw your mortal shoulders back,
Show your spine has nerve and marrow—
Just the things which he must lack.

When you see a theologian
Hugging close some ugly creed,
Fearing to reject or question
Dogmas which his priest may read,
Holding back a noble feeling,
Choking down each manly view,
Caring more for forms and symbols
Than to know the good and true;
Walk yourself with firmer bearing,
Throw your mortal shoulders back,
Show your spine has nerve and marrow—
Just the things which his must lack.

When you see a politician
Crawling through contracted holes,
Begging for some fat position
In the ring or at the polls,
With no sterling manhood in him,
Nothing staple, broad, or sound,
Destitute of pluck or ballast,
Double-sided all around;
Walk yourself with firmer bearing,
Throw your mortal shoulders back,
Show your spine has nerve and marrow—
Just the things which his must lack,
A stronger work
Was never heard
In sense and tone
Than this—BACKBONE.

A modest song and plainly told—
The text is worth a mine of gold,
For many men most sadly lack
A noble stiffne s in the back,
—[Sel.

What Are We Going to Do?

What are we going to do, good friends,
In the year that is to come,
To battle that fearful fiend of death
Whose messenger is rum?
Shall we fold our hands and bid him pass,
As he has passed before,
Leaving his deadly poisoned draught
At every unbarred door?

What are we going to do, good friends,
Still wait for crime and pain,
Then bind the bruises, and heal the wounds,
And sooth the free again?
Let the fiend still torture the weary wife,
Still poison the coming child,
Still break the suffering mother's heart,
Still drive the sister wild?

Still bring to the grave the gray-haired sire,
Still martyr the brave young soul,
Till the rivers of death, like a burning stream,
O'er the whole great nation roll;
And poverty take the place of wealth,
And sin and crime and shame
Drag down to the very depths of hell
The highest and proudest name?

Is this our mission on earth, good friends,
In the years that are to come?
If not, let us rouse and do the work
Against the spirit of rum.
There is not a soul so poor and weak,
In all this goodly land,
But against this evil a word may speak,
And lift a warning hand.

Then lift a warning hand, good friends,
With a cry for home and hearth,
Adding voice to voice, till the sound shall sweep,
Like the rush of death-knell, o'er the earth.
And the weak and wavering shall hear,
And the faint grow brave and strong,
And the true and good and great and wise
Join hands to right this wrong.

Don't Run in Debt.

Don't run in debt—never mind, never mind
If your clothes are all faded and torn;
Fix 'em up, make them do; it is better by far
Than to have the heart weary and worn.
Who will love you the more for the set of your hat,
Or your ruff, or the tie of your shoe;
The style of your boots or shade of cravat,
If they know you're in debt for the new?

Good friends, let me beg of you, don't run in debt,
If the chairs and the sofa are old;
They'll fit your backs better than any new set
Unless they are paid for—with gold.
If the house is too small draw the closer together,
Keep it warm with a hearty good will;
A big one, unpaid for, in all kinds of weather,
Will send to the warm heart a chill.

Don't run in debt—dear girls, take a hint,
If the fashions have changed since last season,
Old Nature is out in the very same tint—
And old Nature, methinks, has some reason;
But just say to your friends, I cannot afford
To spend time to keep up with fashion,
My purse is too light and honor too bright
To be tarnished with such silly passions.

Gents, don't run in debt—let your friends, if the want,
Have fine houses and clothing and flowers;
But, unless they are paid for, be more of a man
Than to envy their sunshiny hours,
If you've money to spare, I've nothing to say,
Spend your dollars and dimes as you please;
But, mind you, the man who his note has to pay
Is the man who is never at ease.

Kind husbands, don't run in debt any more,
'Twill fill your wife's cup full of sorrow,
To know that a neighbor may call at your door
With a bill you must settle to-morrow.
O, take my advice—it is good—it is true!
But, lest you may, some of you, doubt it,
I'll whisper a secret, now, seeing 'tis you—
I've tried it, and know all about it.

The chain of a debtor is heavy and cold,
Its links all corrosion and rust;
Gild it o'er as you will, it is never of gold;
Then spurn it aside with disgust—
"I've tried it, and know all about it."

Accomplished.

Softly fell the twilight shadow,
Over hill and vale and dell;
And the moon beams, soft and radiant,
Kissed the tree-tops as they fell:
While within a low-walled chamber
On a rude couch lay a child,
Pale and fragile as a lily,
With a sweet face, pure and mild.

On her brow was stamped the impress
Of the holy hand above,
And from out her eyes so lovely
Shone the light of heavenly love.
"Mother," and the pale lips parted
With a trembling, gasping moan—
"Mother, I die and leave you:
Die and leave you all alone.

"All alone, for father is not
Like the father I once knew—
Strong and upright in his manhood,
Gentle, loving, kind and true.
I have wept and prayed, oh! mother,
How I've begged that God would hear
My petition for my father,
And you, my mother dear.

"I am dying now, dear mother,
And before another dawn
I shall bid farewell to earth life—
Who will love you when I'm gone?"
The form beside the couch there kneeling
Trembled as with pain of death,
The white face from out the pillows
Rose, while with deep drawn breath

Spoke the mother, 'mid her weeping,
Struggling with a nameless dread—
"Oh, my child, my precious darling!
Can I live when you are dead?"
Then another form rose upright,
Trembling by approached the bed,
Felt upon his knees beside it,
And in broken accents said:

"Child, I will care for your mother,
And if God calls you away,
I will love her as you've loved her,
Hear, my darling, while I pray.
Our Father,"—low the words came,
Choked with sobs of grief, and slow,
"Spare our darling! if she never die,
Give us strength to bear the blow.

"And again, Oh, Father! hear me
While upon my knees I vow,
I'll forever leave the wine cup
Which has brought me thus so low."
"God, I thank thee," the child murmured,
Drooping low her lovely head;
Then a hush reigned in the chamber,
And she fair, sweet child was dead.

KNOWLEDGE is no burden.

A FINE STOCK FARM AND FACTS FROM REAL PRACTICE.

On a clear, bright December morning, such as would be called a Spring morning in any other country, we found a seat on board the Southern Pacific train and rode to Mountain View Station. Along the road farmers were busy plowing and putting in crops of grain. The early-sown and volunteer fields, and the pastures, were as densely green as fields and pastures get to be in the Atlantic States in the month of May. The only sign of Fall and Winter was the slight frost that in places shone white as spotless snow, in contrast to the tender green, and the nearly leafless trees, whose freshly strewn, drifted leaves rustled beneath the tread, as all Autumn leaves do. A blending of Spring and Autumn at once inspired the soul with its life and tinged it with sadness. The bright skies, the singing birds, and the green fields said Spring, and new life, and joy, while the work of Autumn was as clearly visible in bleached stubbles and fallen leaves.

From Mountain View Station, which is a small railroad village, containing the usual taverns, saloons, stores, blacksmith, etc., we walked some three miles, past several snug little farms, past the old town of Mountain View, which was established before the railroad was built, a better looking place than the new one, but composed of about the same number of inevitable saloons, etc., and past more neat farms, until we finally halted at the fine stock farm belonging to

S. B. EMERSON.

This is a farm we have long contemplated visiting. Mr. E. has been farming where he now is over twenty years. His experience has been varied and large, and he has given as much attention to the breeding of valuable farm stock as any man in the State. We not only desired to see Mr. Emerson's farm and to look at his stock, but to obtain facts and get his ideas on the most essential matters pertaining to his business as a farmer, so as to report his methods, etc. Not finding him at home when we arrived, we found in his foreman of the stock yard, Mr. Jerome, an intelligent, kind and trusty man, and from him gained much useful information.

On Mr. Emerson's return, we were induced to remain all night, and although he did not introduce us to his wife, we were treated as generously by a bachelor, in a bachelor's abode, as the most hospitable lady in the land could have treated a husband's friend. But how a good-looking man with a farm can be engaged in the fine stock business without a wife, is something of which the public ought to have a right to demand an explanation.

As we do not often ramble, if our readers will excuse the license we have taken in this long preamble, we will proceed to business.

For several years, Mr. Emerson has paid a good deal of attention to raising fine dairy stock. He imported the first

HOLSTEIN STOCK

to this Coast, and has taken several first premiums on them at different fairs. He has now the fine Holstein bull Oppodocs 8th, which he is serving to about fifty fine heifers, the product of another fine Holstein bull and Durham cows selected on account of their good milking qualities. The Holstein stock is large, black and white, not admired so much for form as for milk-producers. The cross with Short-horns has greatly improved the looks of the stock, and, as the Durham cows were all fine for milk, while it has given a greater beef value to the heifers, it has probably not detracted from their which took first premiums at the State Fair this season.

value as milkers. These heifers he holds at $150 each. Mr. E. has now some 45 head of

DURHAM COWS AND HEIFERS,

full bloods and grades, worth $100 and upwards each. To these—several of which have now young calves by Sheriff, and are giving large quantities of milk—he is serving the fine

IMPORTED BULL, SHERIFF.

This is the bull Mr. E. imported last season together with the cows Cambridge and Isabella, the pedigrees of which here follow:

SHERIFF, red; calved 8th June, 1870; bredby A. J. Roberts, Esq., Lillingstone Dayrell, Bucks, England; got by Cherry Duke *2572,
Dam Seraphina 3d by Royal Essex *1866,
— Spangle by Fitz Clarence *11479,
— Seraphine by Sweet Willum *7571,
— Seraphina by Earl of Essex *6955;
— Sapphire by Stratton *5536,
— Ruby by Fanatic *1996,
— Rufe by Red Rover *1902,
— ——— by Rufus *2576,
— ——— by Emperor *1014.

S. B. EMERSON.

ISABELLA 23d, roan; calved 24th February, 1872; got by Knight of Canada [736], 6243,
Dam Isabella 14th by 12th Duke of Northumberland 4744,
— Isabella 3d by Buccaneer *11217,
— Isabella Howard by the Yeoman *12220,
— Idalia by Lord Marlboro' *7166,
— Isabel by Belshazzar *1703,
— Imogene by Argus *579,
— Sister to Isabella by Pilot *496,
— ——— by Agamemnon *9,
— by Mr. Burrell's Bull of Burdon *1796.

S. B. EMERSON.

CAMBRIDGE 12th, red; calved 18th March, 1870; got by Grand Duke of Oxford [325], 5733,
Dam Cabridge 8th by Grand Duke of Morton 5732,
— Cherry Pie by Lord of the North *11743,
— Celia by 3d Duke of Northumberland *3647,
— Cornflower by Bashaw *1692,
— Columbine by Helmsman *2109,
— Columbia by Columella *904,
— Charlotte by Regent *5544,
— Charlotte Palatine by Palatine *478,
— Charlotte by Palmflower *480,
— Crimson by Patriot *486,
— Young Milbank by Driffield *323,
— ——— by Mr. C. Holmes' Bull *314,

S. B. EMERSON.

AIRDRIE DUKE 3d, red; calved 7th July, 1871; bred by C. L. Vanmeter, Clark county, Kentucky; got by Airdrie Duke, 5306,
Dam Gem 5th by Dick Taylor *5508,
— Gem 2d by Fordham Duke of Oxford *2863,
— Gem (imported) by Broker *2993,
— Gulmare by Norfolk *2577,
— Medora by Ambo *6136,
— Blossom by Memnon *2295,
— Sister to Isabella by Pilot *196,
— ——— by Agamemnon *9,
— ——— by Burrell's Bull of Burdon *1769.

Airdrie Duke, 5306, by Airdrie, 2478; dam Ruth 2d by 2d Duke of Airdrie *19600; g. d., Ruth by Challenger (imported) 324, &c.

Dick Taylor, 5508, by Airdrie, 2173; dam, Ruth by Challenger (imported) 324, &c.

Fordham Duke of Oxford, 2863, by Duke of Gloster *11382; dam Oxford 5th by Duke of Northumberland *1940, &c.

Challenger (imported) 324, by 4th Duke of York *10167; dam Chaplet by Usurer *9763, &c.

Airdrie, 2478 (Red Rose tribe), by Duke of Airdrie *12736; dam Duchess by Buena Vista 299, &c. Mr. Thornton, the celebrated English auctioneer, reports: "I saw the Bull Airdrie, rising thirteen years old, a magnificent animal, not too large, but exceedingly symmetrical, stylish and handsome, with a splendid head and fine masculine character."

S. B. EMERSON,

From each of the above cows Mr. E. has now bull calves some three or four months old, sired by the celebrated Airdrie Duke 3d. These are really beautiful, show all the points of good breeding, and are valued at $500 each. Parties desiring to improve their stock would do well to examine this herd of cattle.

HORSES.

As Mr. E. carries on a very large farm, it is necessary for him to keep a good many horses. He says that for the first ten years he made a great mistake in breeding the "thoroughbred" running and trotting stock for farm use, and lost thousands of dollars in the experiment. Let "professionals" say what they will, he knows that such stock is not worth ten cents for farm purposes, and don't want a drop of such blood in horses for farm work. They are too small; too nervous and excitable; lack the disposition and ability to work, and are neither easily managed nor fit for farm use.

THE PUNCH AND CLYDESDALE

are the horses he breeds from. Good common, useful American mares bred to Punch and Clydesdale stallions produce the best horses for the farm by all odds. Mr. E. was very emphatic in his assertions on this point, and evidently with reasons.

SHEEP.

For several years Mr. E. kept a flock of several hundred sheep, Spanish Merino breeds, on his farm. They were profitable in clearing the land of foul weeds, etc., but he now has nothing but

PURE COTSWOLDS.

These he believes to be the most profitable sheep for farmers with limited range of pasture to keep. His opinion is that the best wool is produced on sheep that are about half Cotswold and half Merino. He had sheared from lambs one to three years old, which were bred from Spanish Merino ewes and pure Cotswold rams, on an average, twenty pounds of highest priced wool annually. He is now producing a fine lot of Cotswolds. Some of those imported last season from Canada are probably as fine as any in the world.

Mr. Emerson believes in the principlo that

EVERY FARMER SHOULD RAISE HIS OWN MEAT,

and not rely on a butcher's wagon to come round two or three times a week. It is

poor economy to buy what can be better produced at home. He has given little attention to any special breed of hogs, but prefers the Essex and Berkshires to any others for his own use. When he wants meat he always has a fat pig, sheep, steer, or some kind of poultry at hand, which cost but little to produce.

He has also a family (?)

ORCHARD, VINEYARD AND GARDEN,

which supplies the principle portion of his fruit and vegetables. Owing to the dryness of his soil, it is not profitable nor convenient to produce all sorts of vegetables without irrigation. For this purpose, and to supply

WATER FOR HIS STOCK,

a wooden pipe runs back some two miles to the hills. Large tanks, holding many thousand gallons of water, are provided as a reserve. From these, iron pipes run to the several yards and stables, where are ample watering troughs conveniently situated.

A LARGE BARN

shelters several hundred tons of excellent hay. Long sheds are winged on either side to stable the stock; also L's at one end for stock, arranged into separate stalls. In large corrls are

IMMENSE STACKS OF STRAW.

Every season all the straw produced on the farm is carefully stacked for the stock to feed upon whenever the feed in pastures is short and when Winter storms make the soil soft and easily poached. We saw a portion of a straw stack ten years old. Mr. Emerson says that the straw improves with age. The cattle, horses, and sheep like it best. It seems to be easier masticated and digested after it remains in stack a few years. Instead of scattering his straw in the pastures he lets the stock run to the stack and help themselves. What straw is trampled under feet makes

EXCELLENT MANURE

with the droppings of the animals. This is applied to the surface in the hay fields. This (last) season the Emerson farm produced 400 tons of hay, wheat and volunteer hay. Mr. E. says that when cut at the right time he considers barley hay the best. The only objection is the beards. Wheat hay is better than any other besides barley. Next ranks rye and oats hay. Our California hay, from sown grains, is better than Eastern timothy. To his milch cows and work horses plenty of good hay with ground barley and wheat bran is liberally fed; and good hay is given to other fine stock when pastures are short.

HOLDING HAY FOR A GOOD PRICE

is a regular practice in years of plenty. In this way Mr. E. says that his hay has averaged him at least $20 per ton ever since he commenced to farm. The same with

WHEAT AND OTHER GRAIN,

of which, last year, he raised 24,000 bushels. By holding for a good price when it is cheap, he has made his wheat bring him on an average not less than $2 25 per hundred pounds. For instance, in 1863, wheat fell to 1¼, and by holding one year it rose to 3¼. At another time he held on to his wheat three years to get his price, and got it.

SYSTEM OF CULTIVATION.

The soil on this farm is rather lighter than the average of valley lands—such soil as dries out quickly in unfavorable seasons. Mr. E. says his experience is that the best grain is produced when the soil is plowed not over three inches deep. To cultivate deeper is a waste of team power, and productive of no good results. After plowing for grain, whether it is done early or late, the soil is thoroughly harrowed. A Buckeye drill is used to sow the grain. Forty pounds of White Australian wheat is drilled in to the acre. The drills are run as deep as the plow runs—about three inches. An average of ten acres a day can be put in with the drill. Much better results are gained from using the drill than from broad-cast sowing, to say nothing about the saving of seed. Where grain is grown this year, hay is grown next, and the third year the field is pastured. His stubble fields are are also pastured every season. Mr. Emerson's farm is divided into convenient fields for this system of rotation. He believes that pasturing a field is better than summer-fallowing it. His system of taking off a crop of hay and then pasturing leaves the land clean of all foul weeds, so that his grain is always clean. His hay is also clean, and of first quality, and his pastures are always rich in nutritious feed. This systen of cultivation enriches his farm. It will produce better crops now than it would twenty years ago. He says that one year with another his farm produces forty bushels of wheat to the acre, and it is not uncommon that sixty bushels are taken from a single acre. While the raising of stock is profitable, it makes his farm, for hay and grain, much more valuable. No farmer can afford to carry on a farm in California without stock enough to make some such system practicable. Think of a dry farm of 750 acres producing 400 tons of hay, 24,000 bushels of grain, mostly wheat, and keeping 130 head of horses and cattle, besides. And what this man has done, cannot others do? There is as much in system, or, in other words, in the man, as there is in the soil. And what is done on a large farm, where so much hired help is necessary, surely can be better accomplished on a small farm, where a man can at once supervise and do the most of the work himself.

We must not forget to mention the implement house, or shed, where the Pitt's thresher, thresher engine, header, grain cleaner, plows, harrows, drill, wagons, etc., are sheltered. Also, the blacksmith shop, where all the tools necessary to repair and mend any machine on farm can be found. Mr. Emerson himself learned the use of tools and the carpenter trade when a boy, and he has a handy man whose business it is to keep all implements, buildings, etc., in repair. He was making steel plow points the day we were there. The saving that any farmer can make by having shelter for his implements, and a set of tools so as to be able to repair the most of his own farm machines, is worth considering. Mr. E. remarked, "If we did not take care of and repair our own tools and machinery, it would take all we can make to pay blacksmith and store bills."

There are many other particulars that we might mention in connection with this farm. Our object is to give some of the main points of Mr. Emerson's experience and practice. Our readers can take them for what they are worth. There is no practical farmer who has followed the business for over twenty years on this Coast, but has learned from experience something that would add to the ganeral store of useful knowledge on the subject of farming here, if it could be brought out and made known. We wish our farmers were more communicative and ready to write their experience. If we can get at it in no other way, we propose to visit one or more places each month, and report as nearly as we can in our own style the facts we can gather; such as will, we think, prove of interest to our own farmers, and to those in the East who are thinking of coming here, and are on the look out for just such information as hundreds of our most experienced farmers are abundantly able to give.

Jerseys vs. Durhams and Ayrshires.

Our contemporaries of the Sacramento Valley *Agriculturist* say:

"As for fattening, our experience and observation shows that they (Jerseys) take on fat more quickly than the Durhams or Ayrshires, which is a great point, when we consider that the steers have to be fatted for the slaughter-house."

This may be the extensive (?) experience of the writer, but, if so, it is in exact opposition to that of the great majority of other stock breeders. As milkers, and for the very best quality of rich milk, the Jersey is ahead, but there the merits of the animal rest.

Japanese Maples.

The *Rural Press* mentions a recent importation of twenty-four varieties of maples from Japan by a gentleman of San Francisco. The *Press* says.

The trees were accompanied with beautifully colored plates descriptive of the foliage of all the varieties. These plates were executed by the Japanese, the coloring as well as other parts being done by hand. A leaf of every one of the 24 varieties is given, its form and color being represented in all their minutia. The varieties of foliage displayed here is remarkable, many of the leaves being extremely unique in form and color.

The importation consists of six trees of each variety; all grafts, and all in excellent condition for planting in California. The growth of this interesting family of maples will be watched with a good deal of interest by horticulturists generally, as well as by those who were fortunate enough to procure them.

A Vermont lady fainted away at a party, and when a young man cried out for some one to saw her corset strings in two, she arose, drew a pair of shears, and said she'd like to see 'em saw.

One may live a hero, a conqueror, or king; but he must die a man.

RAISIN VS. WINE GRAPES.

The following advice, from the Sacramento *Recod*, is just such as we have been giving for the last three years. When we stated, two years ago, that raising grapes for wine was not profitable, and that certain parties were rooting up their vines and converting the land into grain fields, a howl was raised against us by the press. We were charged with trying to injure "the great and growing industry of the Pacific Coast—wine-making." We then advised, as we do now—and as sensible writers generally do now—the converting of the wine vineyards into raisin vineyards.

It has been proved that the Mission vine makes the very best root to graft other varieties onto. The White Muscat of Alexander, the best raisin grape, does better grafted on the Mission than it does on its own root.

Planting wine vineyards has kept many men poor, and made many drunkards, in California, but whoever has cultivated fine raisin and table grapes has made money.

But hear what the *Record* has to say about the matter:

Don't Destroy the Grape Vines.—We learn that many persons in different portions of the State who have small vineyards, and who do not wish to make their grapes into wine or brandy, for the reason that wine and brandy cannot be made to pay on a small scale, are talking of digging up their vines. Such persons generally have the Mission or Native California grape, and perhaps no other in cultivation, and we are fully aware that the past experience of such is anything but encouraging for the future, without same change that will prsmise and bring better remuneration for the use of their land, and the labor necessary to cultivrte the vineyard, pick and market the grapes. We also know that at this time a very little additional outlay will bring this desired change. Let these native vines be grafted with the White Muscat of Alexandria or White Malaga grapes, and the second year after grafting the crop will very nearly equal in amount the present crop of native grapes. Instead of having on hand then a grape valueless to you for wine-making purposes, on account of your situation, and good for no other paying purpose, you will have a crop of grapes valuable for raisins.

Then the objection that you have but a limited quantity will not apply, for you can make a small quantity of raisins just as cheaply, and with just as much certainty that they will be of good quality, as though you had the largest vineyard in the State; you can make them, too, when you would be doing little else, when your labor and time cannot be better or more profitably employed. No farmer should be so short-sighted at this time when we all know the great curse and drawback to California agriculture is want of variety in production.

Again, raisins have been made in many localities by the Alden process, and we believe in every instance those making them are well satisfied with the results, both financially and otherwise, and many of them are preparing to increase their vineyards instead of decreasing them. Alden machines will be erected in nearly every locality in the State within a few years, and it would be a pity, just as circumstances are so promising to render your vines valuable, to root them out, and thus throw away all the labor and expense of cultivating them up to the present time and the good prospects for profits in the future.

"See," said a sorrowing wife, "how peaceful the cat and dog are." "Yes," said the petulant husband, "but just tie them together and then see how the fur will fly."

MERINO AND COTSWOLD.

We believe that a good cross between the Merino and Cotswold can be produced that will greatly improve the Merino for useful wool and mutton.—California Agriculturist.

We think that the writer of this paragraph does not fully understand the subject he is trying to handle. We do not believe that a cross between the Merino and Cotswold would give a superior article of wool. It would certainly produce wool of a coarser texture than the pure Merino, and of less length and strength than pure Cotswold wool. We have distinct classes of wool—fine wool, and long wool. Both of these classes have their importance in the factories, and fine wool cannot be worked to advantage without long wool, neither can a fine quality of woolen goods be made without the use of fine wool. There is greater demand for "warp," and has been for years in this country, than for filling. We are satisfied that the time is not far distant when we will have factories to work up every pound of wool raised, and will have to raise long wool or import it. Combining wools used in the Eastern factories are now brought from Canada, where the Cotswold, Southdown and Leicester breeds predominate. The great object in raising long wool is to have it as strong as possible, and in order to do this the sheep must have better range. Whenever an animal falls off in flesh, then there will be a weak place in the fibre, which will be apt to break in combing. In the large Eastern factories it has been found that the wool from pure bred Cotswold and Leicester is the very best warp that can be used, and any attempt to cross these animals with fine wool will not only make the long wool less valuable for warps, but will impair the quality of the fine wool for filling. Experiments are good sometimes, but they should always be made with a thorough understanding of the end aimed at, and the result desired.

In the above the *Sacramento Valley Agriculturist*, of Dec. 20th, has quoted our words correctly. The opinion we expressed was the result of mature deliberation, and is confirmed by the experience of many practical wool growers on this coast. It will be noticed in our report of a visit to S. B. Emerson's farm, that Mr. E. is of the same opinion. We have referred the above criticism of our opinion to Lewis & McCracken, well-known wool growers in our valley. They both say that they have produced and sold wool from Cotswolds graded on Merino sheep, first and second crosses, that has brought 33 per cent. more per pound than the pure Merino wool sheared at the same time. This they have done for the past two years. They assert that a seven-eighth Cotswold from pure Merino produces a combing and delaine wool, which demands the very highest price in the Eastern markets, as can be proved by the quotations of the Boston, New York and Philadelphia commercial papers. On the other hand a three-quarter to fifteen-sixteenth Merino from a Cotswold cross not only gives a better frame, and mutton value to Merinos, but also greatly increases the value of the wool.

On this coast where at two seasons the pasture is short, and where scab is bad, and it is found practicable to shear the sheep twice each year the fine, short, pure Merino wool is not as valuable as the longer staple from a little mixture of Cotswold blood. Markets are governed by the demand for different grades of wool. The wool in the greatest demand now is just such staples as can be produced from graded sheep at either end of the grade, The kinds of clothing the most in fashion and in demand are manufactured from just such wool. In California the woolen mills use neither the finest Merino nor the very longest combing wools, they demand such wool as will make the best goods, for usefulness.

What our contemporary says about "warp and filling" is very true, so far as it goes. A very strong warp is needed for a very fine and week filling, but the best cloth for actual service has both substantial warp and filling. The homespun that the writer of this article used to wear in school-boy-days, woven by mother's own hand on the family loom, was of this sort, and it was almost everlasting. Our only excuse for "expaciating" upon this subject is that it is one of much importance to all wool growers.

To Prevent Ruts in Roads.

A Western exchange contains the following practical hints on this subject:

The art of road-making is yet in its infancy in this country. The roads are not laid out, made, or repaired with reference to economy of draft in using them. Deep ruts are soon worn in them by the common vehicles that past over them, and these grow worse and worse, until they are almost impassable in Spring. Broad cart tires are a partial remedy for these. Longer yokes, both for oxen, and for double horse wagons and carts, compelling the teams to walk in the same line with the wheels that come after them, would be a still better remedy. On most country roads there are two tow-paths and two ruts, and it is not noticeable that the tow-paths are always in much the better order. Longer yokes would bring the paths and ruts together. The feet of the teams would break down the sides of the ruts, and fill them as fast as they were formed. This would improve the road bed, and make the draft of loads easier, We cannot shorten the axle trees without increasing the danger of upsetting, but we can lengthen the yokes with safety. Legislation is needed.

We regard this idea as a most practical one; but unless the whole community of teamsters would observe the rule, it would only make the traveling all the more difficult for the one or two who might try it. Legislation would be the only way to compel a general reform of the kind.

Shipping Meat Instead of Grain.

Mr. Joseph Harris says, in the *American Agriculturist*, "I hope and believe that the time is not far distant when not a bushel of wheat or corn will leave our shores. We ought to raise all our own wool, and supply the world with pork, bacon, hams and lard. To ship a carload of thin hogs from Iowa to Buffalo,, and send four carloads of corn along with them to fatten them here, paying freight and commission on both, is poor policy. To ship corn to Ireland to make pork and bacon for the English market, is equally unwise. Better feed out our own corn at home, and learn to furnish the bacon, hams and lard, which the foreign market demands."

This advice will as well apply to the Pacific States as to the Eastern and Western States. Our wheat and barley, if converted into pork to supply the home market, would pay better than to ship it to Europe and import bacon.

No man knows what good friends are worth until he is without them.

Correspondence.

Experience of a Lady Canvasser—Some Hints for Lady Readers.

Eds. Agriculturist.—I have some more subscribers for your monthly, I write to send their names. Such funny times as one has canvassing! I have many an inward chuckle at the excuses people make for refusing to subscribe, half tempted by the showy chromo. To some I set forth in glowing colors the sound temperance views of the editors which forbid the acceptance of liquor advertisements, while to others I explained the benefits of temperance in diet, and the important hints derived from the Hygienic department, and the valuable information gained on horticulture and agriculture for those cultivating the soil. "Wal now," said one communicative old lady, "there's Susan Ann, she sets a store by picters. Her bedrum is a sight ter behold, with the curiousest scenes out o' the *Harper's Weekley* and the New York *Graphic*, is that what they call it? I know pretty well she'd like ter patronize yer. How much do you say for the hull four of them picters without the paper, which, I dare say, there ain't a soul in the house would ever look at. Not sell the chromos without subscribing for the paper? Well I never! There's no use talking, Susan Ann has just enough money laid by to get her a smart hat for the Thanksgiving time, and I don't know about her layin' it out for readin' matter. I guess, on the whole, you'd better call agin when the gal is to hum, and then we'll give you an answer."

Several families had more books and papers subscribed for than they found time to read. One young mother, with three babies toddling around her, said she could not see her way clear to sit down from morning till night except to tend to baby. "Is there another baby?" I asked. "Yes indeed!" and she led the way into a back room where lay, stretching itself, a tiny creature, fat and good natured. The cooking, washing and ironing, and caring for these four, besides the family mending, and meals to be regularly served when *father* comes home, devolved upon this one young creature, scarcely twenty-five years of age. At night, when all the "bairns" were tucked up in their little beds, I can well imagine the state of mental exhaustion she must be in, and a swift walk in the fresh air would be far more conducive to health than sitting at home reading.

One whose name I send told me she hoped each paper contained something in the domestic line, for really we all need new ideas on the proper way of doing things which cannot be learned from school books.

Everywhere I go I find women struggling for a better way to get through with life's disagreeable duties. A young wife, fresh from boarding school life, tells me she wishes she could have spent a little time before her marriage in watching a good housekeeper manage her work, for, though her husband provided a Chinee boy to do the cooking, she found it very humiliating to confess even to herself her incapacity to tell him how to concoct some favorite dish her husband's mother made to perfection. It is well perhaps for the health of the coming generation that our young women are so deficient in the old system of cooking which has sent so many to their graves or left them utter wrecks upon society—living illustrations of the effects of intemperance in cooking. If we could but have the new system of simple diet introduced and presented in a favorable light, these young mothers would spend less anxious time nursing their babies through teething and the little ailments of childhood; the wet compress to soothe to sleep when bowels are irritated; the hot bottles for the feet when cold—and many other simple remedies so grateful to the little, fretful sufferers."

Come all ye successful mothers of strong, healthy children, send in your experience to help other mothers to save their little ones from the destroying angel, and all the good thoughts which come to us in our homes which have a tendency to assist others in the holiest work given to woman, the rearing of the young, let us not keep to ourselves, but share with all who read the columns of the California Agriculturist. Nell Van.

Nicolaus, Sutter Co., Cal.,
December 8th, 1874.

Eds. Agriculturist:—Please find enclosed $1 75 as per your statement of my account due you.

I like the Agriculturist as a good friend to the farmer and to all classes of mankind. The cause of my discontinuing to be a subscriber is unavoidable, having lost by death, in July last, my wife, daughter and son—I am therefore left a wanderer on the earth, no permanent home or address. With good wishes for the success of the Agriculturist, I am, Respectfully,

Jas. O. Harris.

We extend our heartfelt sympathy to our friend in affliction, and wish him consolation of spirit above the reach of ill.

Live Stock and Population.

Professor Thorold Rogers, of Oxford University, England, has made up a curious return of the proportion of domesticated live stock to the population in the most prominent countries in the world. It shows the following results:

Great Britain has one cow to ever twelve persons, a sheep for everybody, and one pig for every six.

France has a like proportion of sheep, a double share, comparatively, of cows, but only one pig to six persons.

The Swedes have a cow between three and one-half of them, a sheep between two and three-quarters, and a pig to a baker's dozen.

There are as many sheep as there are Norwegians in Norway, when they are all at home, and two and one-half of them—the Norwegians—are entitled to a cow. They can have one and one-eighteenth of a pig each.

Denmark has a cow for three persons, as many sheep as persons, and a pig for four and three-quarter persons.

Prussia, with her usual uniformity, has an equal number of cows and pigs, one to every five inhabitants, besides a sheep apiece all round.

Wurtemberg has a quarter as many cows as people, a sheep to two and three-quarters and a pig to seven.

Bavaria rates the same as Wurtemberg, as to cows and sheep, and is as much better off for pigs as one-fifth is better than one-seventh.

Saxony has a sheep and a pig for every eight persons, and a cow for every six.

Holland has a cow to four, a sheep to four, and a pig to twelve persons.

Belgium has a cow to every six persons, a sheep to nine, and a pig to eight (which is an Hibernicism).

Austria has a cow to six, and a sheep and a pig to every five persons.

Switzerland runs up to the Swedish standard on cows, one to three and one-half persons, and has a sheep for five and a pig for seven and one-half persons.

We Americans close the list with a cow for every four of us, a sheep apiece, and one pig to every one and one-half.

Meeting of the National Grange in Charleston.

The National Grange, Patrons of Husbandry, of the United States will commence its annual session in Charleston, on the first Wednesday in February, 1875. It will be a great occasion for this city, for the State of South Carolina, and for the South generally—indeed, we may say, for the whole country, since it will promote, as nothing else could, the true unity of the Republic and fraternal feeling and kindliness among the people of all parts of our land. It will bring here representative men from every State and Territory of the Union, and the British Provinces, all working together for the common good and all bound to each other by the most sacred obligations and the closest brotherly ties, The spectacle will be impressive and its significance of the gravest import. The representatives of the Granges come here for work, and that work will be of the most serious and important character. We trust it will be wisely performed. But we believe in recreation as well as in work, and the Patrons of Charleston and of the State intend to provide such means of recreation as will make the visit of our brothers and sisters from abroad as pleasant as we have no doubt it will be profitable. Next month we hope to be able to give our programme of reception and entertainment in full. In the meantime, brothers and sisters of the North, the South, the East and the West, be assured that a warm, hearty, fraternal welcome awaits you in this famous old historic "City by the Sea." We open the doors of our homes and our hearts with true Southern hospitality to all who come with the Pass-words and Signs of the "Noble Order of Patrons."—*Rural Carolinian for December.*

Roots for Stock Feeding.

In Brittany, the parsnip is becoming the favorite root for stock feed, and its culture is extending. In the Channel Islands this root forms a large portion of the fodder to the Jersey, Guernsey and Alderney cows, and much of their value as rich milkers is undoubtedly due to the use of this root for a long series of years. It is well known to physiologists, says the New York *Tribune*, how great an effect upon the condition of a breed of animals is caused by a long period of careful feeding, and this is a conspicuous instance of it. This root in many parts of France is substituted for oats as feed for horses, sixteen pounds a day being given with the best effect. For pigs it is also largely used, nine pounds of cooked roots being fed four times a day. One great advantage of this root is its hardiness; the supply for Spring may be left in the ground all Winter, and is in the best condition to harvest at any time when needed.

Orange Culture in Upper California.

The San Francisco *Chronical* tells of a cluster of sixteen oranges on a limb two feet long that grew at Camp Seco, in the orchard of J. J. Mackay. It says:

The fruit is larger than the Los Angeles oranges and is sweet and juicy. The tree upon which it grew is about twelve years old, but the fruit was grafted upon it a few years ago. Mr. Mackay has been very successful in demonstrating the fitness of that section for the culture of the orange. The trees bear prolifically. One branch in his orchard last season had a cluster of twenty-six oranges upon it. Mr. Mackay has found a ready market for the fruit. In a few years many of the hills of that section, now comparatively unproductive, will be waving with orange groves and returning a handsome reward to husbandmen.

Those who taught us to talk omitted to teach us when to hold our tongues.

Domestic.

Cooking Eggs.

Eggs bear a relation to other animal food similar to that which seeds bear to other vegetable food. They are the depositories of vitality, stored up to form a new link in the continuation of the species. They are probably the purest form of animal food, though they compare unfavorably with seeds in many respects. They lose their vitality sooner, and they partake more or less of whatever impurities may have belonged to the animal that produced them. They are not so nutritious as some of the seeds, and they require more care in cooking.

Like seeds, one of their principal ingredients is albumen, which is nearly pure in the white; but, unlike vegetable albumen, it coagulates with heat; if the heat is great, becomes so hard as to be extremely difficult of digestion. Hence eggs are more easily digested raw than cooked, and hence also the objection to hard boiling. Dr. Beaumont found bits of harh-boiled egg-white, no larger than a pea, sometimes remained in the stomach after everything else had yielded to the action of the gastric juice. Such logic is unanswerable. He deduced from it the importance of careful mastication. We women can go a step further, and find in it an intelligent reason for so cooking the eggs that they will not require this extra care. Fried eggs are still worse than those which are boiled, both because subjected to a greater degree of heat, and because of cooking fat into them.

Even in the common method of boiling them rapidly in "three and a half minutes" the albumen next the shell is quite too hard. It should be uniform and custard-like, and this is secured by the method, now becoming quite common, of merely letting the eggs stand from seven to ten minutes in hot water. This should be boiling hot at first, but the cool eggs reduce its temperature somewhat. The exact time required will vary with the relative proportions of eggs, with the heat and thickness of the utensil used, with the warmth of the place where it stands, and with the weather also, a little more time being required in dull weather. The cook will soon learn what allowance to make for her utensils; and for the rest she must use her judgment every time. They are not so easily spoiled, however, as in boiling. If left in a little too long they can be plunged into cold water for a minute or two. If kept hot until the whites stiffen, the yolks will not be hard. The yolk should be cooked just enough not to break rapidly when turned out. These are properly speaking not "boiled eggs," but "curdled eggs."

These curdled eggs make an admirable dressing for many breakfast dishes—boiled sauap, oatmeal mush, cracked wheat, and especially small hominy. The gentle method of cooking eggs may also be observed in making egg-toast. Have the milk almost boiling, in a flat dish, and break in the eggs one by one, cooking a few at a time, and being careful not to let them run together. Sprinkle in a little salt, and let them stand hot and covered until firm enough to take up without breaking. Then have ready some split batter biscuit (gems), softened in hot milk and laid on a platter, and when the eggs are done dish them one on each half of a biscuit and serve warm. This is a handsome dish, and though not quite so digestable as hominy dressed with eggs curdled in the shell, it is still far better than fried potatoes and griddle cakes that form the staple of so many breakfasts.—*Science of Health.*

"Only Fifty Cents a Week."—A few evenings ago a young man said in my hearing "I am getting to be more economical in tobacco using. Now I only use fifty cents' worth (?) a week. I used to use nearly double that amount, but have quit using so much, but *must have* fifty cents' worth."

Only fifty cents a week; which is only twenty-six dollars a year; which is only *six hundred and fifty dollars* in twenty-five years, saying nothing about the interest—and all for tobacco. And then said gentleman would be only forty-five, and probably would not quit using it. It is quite safe to say that he will chew up and spit out at least one thousand dollars before he dies.

This same fellow frequently talks about the extravagance of women, and says "a man had better be murdered than married." I have always noticed that the men who have the most to say about woman's extravagance and expensive families, used tobacco themselves, and that it was quite a large item in the family account. I suppose their consciences smite them, and, Adam-like, they must say it was Eve. It is rather strange that all of Adam's sons take after their father. And money is not all it costs. Just think of the delightful work of cleaning up after these tobacco-chewers. One cannot help exclaiming: Oh, for

> A spot yet undefiled by those who use the weed,
> And where mankind the rules of neatness heed.

Then, if the one that has caused all this loathsome work chances to come in and does not find the woman "wreathed in smiles," he goes out cursing women for being so cross, and sighing for a land where women are unknown.

Alas! how much money and happiness is annually spent for tobacco.—*Kate Reuel, in Farmers' Union.*

Colored Inks.—The following recipes have been well tested and are commended by good authorities as preferable to the solutions of aniline dyes which are now so extensively used as colored inks:

Green.—Two parts acetate of copper, one part carbonate of potash, and eight parts water. Boil till half is evaporated, and filter.

Blue.—Three parts Prussian blue, one part oxalic acid, and thirty parts of water. When dissolved, add one part of gum arabic.

Yellow.—One part fine orpiment, well rubbed up with four parts thick gum water.

Red.—With the aid of a gentle heat, dissolve four grains of carmine in one ounce of aqua ammonia, and add six grains of gum arabic.

Gold.—Rub gold leaf, such as is used by book-bineers, with honey till it forms a uniform mixture. When the honey has been washed out with water, the gold powder will settle at the bottom, and must be mixed with gum-water in sufficient quantity.

Silver.—Silver-leaf treated in precisely the same manner gives a silver ink. Both these inks may, when dry, be polished with ivory.

Black.—Three ounces crushed gall-nuts, two ounces crystallized sulphate of iron, two ounces gum-arabic, and twenty-four ounces of water.

White.—Fine French zinc-white, or white-lead, rubbed up with gum-water to the proper consistency.—*Boston Journal of Chemistry.*

Fried Potatoes.—Who will say after reading this that a poetic mind will not invest anything with interest. Just think of fried potatoes melting away "like a kiss on the sweet lips, with a dying crackle," etc.:

Select eight large potatoes, pare and slice thin, soak in cold water for two hours, and stir common table salt into the water, one teaspoonful to a quart, and allow them to remain in the brine half an hour longer. Pour them upon a screen to drain, and put on a spider with a pound of clear lard over a brisk fire. Wipe the sliced potatoes dry on a towel; wait until the lard is smoking hot and pour a large plateful into the spider. The result is like a small sea in a white squall, and now the cook shows the artistic soul, which every votary of that noblest of the arts must possess to be worthy of the name. Patient and calm, with steady and incessant motion of the skimmer she prevents adhesion of any too affectionate slices, and watches carefully for the tender blush of brownness to appear. Slowly it creeps, and deepens until it rivals the hue of the fragrant Havana. Haste then takes the place of caution, lest any martyrs burn for the perfection of the others, and they must be quickly spread upon another sieve to drain until dry, and greaseless enough for the fairest fingers, then served hot, to melt away like a kiss on the sweet lips, with a dying crackle like the fallen leaves of Autumn.

Old Potatoes.—An Eastern exchange gives this advice: Potatoes, to be good, should never be exposed to the light, but be kept in as dark a place as possible. After they begin to sprout in the Spring they should be taken up from the bins or heaps and kept in boxes or barrels saved out for family use, instead of picking them over and spreading them every few weeks, put them into enough barrels so that you can easily turn them from one to another. Have one extra barrel, and once every week turn them all out from one barrel to another; this keeps them moving so often that the sprouts cannot grow enough to do much harm. The sprouts which come out from the potato use up the nourishment it contains, and leave it soft, watery and insipid. By treating them as proposed above, they may be kept in condition for the table several weeks longer than by sprouting them, and at the same time save a good deal of work.

Keep it from Them.—Don't give liquor to children. Possibly you can do it with safety but the chances are against it. One of the first literary men in the United States said to a writer: "There is one thing which, as you visit different places, I wish you to do everywhere, that is, entreat every mother never to give a drop of strong drink to a child. I have had a fight, as for my life, all my days to keep from dying a drunkard, because I was fed on spirits when a child, and acquired a taste for it. My brother, poor fellow, died a drunkard. I would not have a child of mine take a drop of liquor for anything. Warn every mother, wherever you go, never to give a drop to a child, as she values its future happiness."

Making Good Paste.—Mix two tablespoonfuls of wheat flour with cold water to a smooth paste by putting in but little of the water at a time; its consistency must be a little thinner than the thickening for stews. Place it upon the fire to heat through without boiling; apply it with a small brush. It is best to make it as needed, though a small piece of alum will keep it from turning sour.

An Economical Way of Making Books for the Little Ones.—Cut pieces of cotton or muslin the size of the book wanted; six leaves will do; bind them together with a piece of ribbon, and on them paste pictures of almost any description. Get the little ones interested; they will soon make a collection. Cutting them out of old books and papers will often keep the little chatter-boxes quiet when mamma is puzzling her brains for something to amuse them. On the first leaf can be pasted letters to spell Picture Book.

Artesian Wells in Tulare County.—We have recently had our attention called to the artesian well bored by Mr. W. S. Chapman on his ranch near the town of Merced. A large stream is discharged from it, which courses its way across the plains ten or twelve miles and finally enters the San Joaquin. Some four or five thousand head of cattle, and as many sheep, depend upon this stream for water. Mr. W. W. Wright informs us that during the past Summer he has met an artesian force of two feet hydrostatic in wells of twenty-five feet which he has bored. There evidently is no difficulty about obtaining artesian water in Tulare Valley.—*Visalia Delta.*

Household Reading.

Home.

MORE than building showy mansions,
More than dress and fine array,
More than domes and lofty steeples,
More than station, power, and sway;
Make your home both neat and tasteful,
Bright and pleasant, always fair.
Where each heart shall rest contented,
Grateful for each bounty there.

Seek to make your home most loving;
Let it be a smiling spot,
Where in sweet contentment resting,
Care and sorrow are forgot;
Where the flowers and trees are waving,
Birds will sing their sweetest song;
Where the purest thoughts will linger,
Confidence and love belong.

There each heart will rest contented,
Seldom wishing far to roam;
Or, if roaming, still will ever
Cherish happy thoughts of home,
Such a home makes man the better,
Sure and lasting the control:
Home with pure and bright surroundings
Leaves its impress on the soul.

Chats With Farmers' Wives and Daughters---No. 2.

BY "JEWELL."

The question often arises in my woman's mind: Which is actually most necessary for the welfare of our children—their present and future—that our entire time be spent in the daily round of duties which "home life" brings to every mother, or that a few moments or hours, daily, be taken to cultivate her mind and fill her soul with inspiration to fresh exertions? I believe that the busy farmer's wife even should take this time, which is rightfully hers, and that she should be provided with books and papers that she may catch glimpses of the outside world, which often seems to have forsaken her in her isolation and heavy burdens. While I do not wish to be harsh, still I feel that a farm life is generally more burdensome upon women than men, and few farmers fully understand and appreciate this fact.

To stay indoors and cook, wash, iron, sew, sweep, etc., every day, month and year, besides the drain upon life and soul of childbearing, nursing the sick, and the responsibility of bringing up the little ones, is actually more than most women are able to do—unless strong in body, which few of our women of to-day are.

I feel hopeful that the future benefit of the Grange movement is to come through its women. Their attendance weekly at the Grange meetings is not only a relief to them, but widens their circle of acquaintances and sphere of social life; and is at once uplifting to both brothers and sisters. The mingling of the feminine element in the business as well as pleasure of the meetings will tend to purify the one and cultivate the other, which must give health and joy to many a home.

EARLY RISING.—Early rising, in civilized society, always tends to shorten life. Early rising of itself never did any good. Many a farmer's boy has been made an invalid for life by being made to get up at daylight, before his sleep was out. Many a young girl has been stunted in body and mind and constitution by being made to get up before the system has had its full rest. All who are growing, all who work hard, and all weakly persons, should not get up until they feel as if they would be more comfortable to get up than to remain in bed; that is the only true measure of sufficiency of rest and sleep. Any one who gets up in the morning feeling as if he "would give anything in the world" to remain in bed a while longer does violence to his own nature, and will always suffer from it—not immediately, it may be, but certainly in later years, by the cumulative ill-effects of the most unwise practice. In any given case, the person who gets up in the morning before he is fully rested will lack just that much of the energy requisite for the day's pursuit.

As a people, we do not get enough sleep, we do not get enough rest, we will not take time for these things; hence our nervousness, our instability, our hasty temper, and the premature giving out of the stamina of life. Half of us are old at three score, the very time a man out to be in his mental, moral and physical prime. Half of our wives, especially in the farming districts, die long before their time, because they do not get rest and sleep proportioned to their labor. Nine times out of ten, it would be better for all parties if the farmer should get up and light the fires and prepare breakfast for his wife, she coming directly from her toilet to the breakfast table, because it almost always happens that she has to remain up to sit things right long after the husband has gone to bed, when he really has nothing to do after supper but to go to bed. This is a monstrously cruel imposition on wives and mothers.—*Hall's Journal of Health.*

FOR SELF OR FOR OTHERS?—The secret of dullness and discontent with many a life is, that it has no other life to bless. It is shut up in itself. It never breaks bounds and gets abroad. Get out of self, begin to think of another, to care for another, and all the tides of the soul are in motion. The dull self-brooding is at an end.

When self is forgotten, its weariness and fretfulness are forgotten. It is delivered from its own burdened consciousness, by entering with hearty good will into the experience of the friendless and helpless.

This is the cure which is needed for jaded spirits. It is sovereign and infallible. Find somebody to help, and you help yourself; some heart to cheer, and you cheer your own; some burden of another to bear, and yours becomes light; enter into the straitened lot of one in need, and you get enlargement from your own bondage; learn to weep with those that weep, and your tears are a balsam to your own heart; rejoice with those that do rejoice, and your own griefs are assuaged, and your joys are doubled. It may be but little that you can do; do that little, and the world is so much happier and better, and a brighter sky shines upon your face. You have but an ounce or two of strength to spare; share that with one who is spent, and the perfume of this small benefaction will be to you as reviving incense. The remedy is safe and sure.

GIRLS, let us tell you a stubborn truth. No young woman ever looked so well to a sensible man, as when dressed in neat, plain, modest attire, without a single ornament about her person. She looks then as though she possessed worth in herself, and needed no artificial rigging to enchance her value. If a young woman would spend as much time in cultivating her temper, and cherishing kindness, meekness, gentleness, mercy, and other qualities, as most of them do in extra dress and ornaments to increase their personal charms, she would, at a glance, be known among a thousand. Her character would be read in her countenance.

"DEW DROP BILLIARDS" is the sign over a Cincinnati billiard saloon. The advice is good. We second it, and say to all young men, "Do drop billiards."

Ants vs. Caterpillars.

The Belgian *Official Journal*, referring to the ignorant conduct of those who destroy all kinds of birds and insects indiscriminately, insists on the necessity of children in primary schools being taught to distinguish between useful and noxious insects, and thus to exercise their destructive faculties against the latter only. The writer proceeds to say that the ant, which is very disagreeable and inconvenient in many respects, does excellent service in chasing and destroying caterpillars with relentless energy. A farmer who had noticed the fact, and had had his cabbages literally devoured by caterpillars, at last hit upon the expedient of having an ant hill, or rather nest, such as abound in pine forests, brought to his cabbage plot. A sackful of the pine points abounding in ants, was obtained and its contents strewn around the infested cabbage plants. The ants lost no time, but immediately set to work; they seized the caterpillars by their heads. The next day heaps of dead caterpillars were found, but not one alive, nor did they return to the cabbages. The value of ants is well known in Germany, and although their eggs are in great request as food for young partridges, pheasants and nightingales, there is a fine against taking them from the forests. The ant is indefatigable in hunting its prey; it climbs to the very tops of trees, and destroys an immense quantity of noxious insects.

AT the late election in Michigan, the question of woman's suffrage was voted on, and 39,000 votes were cast in favor, which would seem to indicate the number of advanced men in the State. We all know that no State is much ahead of Michigan for schools, farming and fruit-growing. The Grand Rapids *Post* relates the following:

A dirty, debased, and ignorant-looking man came in to vote. Said one of the ladies, offering him a ballot,

"I wish you would oblige us by voting this ticket."

"What kind of a ticket is that?" said he.

"Why," said the lady, "you can see yourself."

"But I can't read," he answered.

"Why, can't you read the ballot you have there in your hand, which you are about to vote?" the lady asked.

"No," said he; "I can't read at all."

"Well," said the lady, "this ballot means that you are willing to let the women as well as the men vote."

"Is that it?" he replied. "Then I don't want it; the women don't know enough to vote."

Short-Horn Statistics.

The National Association of Short-horn Breeders, which recently met at Springfield, Illinois, having entrusted Aleck Charles, Cedar Rapids, Iowa, with the work of procuring complete statistics of all Short-horns now living in the United States and Canada, for publication in the report of their proceedings, we would urge upon every one of our readers who are breeding Short-horns, either upon a large or small scale, to send in prompt and careful returns; and those who have not received blanks for that purpose will be furnished them free of charge promptly, on application to Mr. Charles. Short-horn men will please give this their very earliest attention, for by so doing the forthcoming report of the American Association of Breeders will be made the most valuable and interesting publication ever issued in this country.—*National Live Stock Journal.*

A COW WITH A WOODEN LEG.—An English country paper records the following facts: A young cow on the farm of Mr. Wilson, in Borrowdale, Cumberland, recently broke her leg. It was amputated, and a wooden leg supplied, and she is now walking about and doing well.

The Dairy.

Something About Milk.

THE Massachusetts *Ploughman* has been giving a series of articles on milk, from which we extract some curious iteme of information:

Milk is produced by the females of all that class of animals known to naturalists as the *mammalia*, and was evidently designed by Nature as the nourishment of the young of those animals. As such it has been used by man from the earliest periods of the human race. The milk of the camel is still used in Africa and in some parts of Asia; that of mares in Tartary and Siberia, and that of goats in Italy and Spain, while that of the cow is most universally used and most widely esteemed.

Milk is a compound, an opaque fluid, generally white, of a sweet and agreeable taste, and made up of an oily or fatty substance known as butter which gives it its richness, of a caseous or mucilaginous substance which gives it its strength and from which cheese is obtained, and of a serous or watery substance which makes it refreshing as a beverage, with a small per cent. of sugar of milk to which it owes its sweetness.

In the milk of the cow, which we are now to consider, the fatty substance ranges from two and a half to seven per cent. the cheesy matter from three to ten per cent. and the watery parts from eighty to ninety per cent.

Although to the naked eye milk appears to be one homogeneous mass, yet, when viewed under the microscope, myriads of little globules of various sizes and forms, but mostly round or ovoid, seem to swim suspended in the watery substance, and on a more minute examination it will be found that these are the oily particles encased or surrouned by a cheesy film, and which by their comparative lightness are soon to rise to the surface and form the yellowish, semi-liquid coating known as cream.

These particles are so minute that they filter through the finest paper, and they are so generally diffused through the mass of milk as it is drawn from the cow, that they do not interfere with its ready assimilation with water or other unfermented liquids, although its weight is four per cent. more than that of water, and notwithstanding the difference in specific gravity.

Cold condenses milk, while heat liquefies it. The elements of which it is composed, varying as they do in character and specific gravity, rapidly change their relative positions when the milk is at rest. The oily or buttery particles rise to the surface, while the serous or watery matter, on account of its greater weight falls to the bottom.

The oily particles of milk in rising bring up along with them a large proportion of the cheesy matter adhering to them mechanically, and some of the watery particles by which they are surrounded. If these particles rose up pure and free from the admixture of the other substances they would appear in the form of pure butter, and one of the principal objects of churning is to free or disengage the oily substance from the other elements, which in rising it has brought up with it.

The caseous matter, under the influence of high temperature, has a tendency to collect and form a body by itself, known as curd, and in forming this partial solidification it becomes separated from the whey, or serous matter, so that after a lapse of time, the three principal constituents of milk will appear in forms distinct and peculiar to themselves, and we then have the cream or butter, the curd or cheese, and the liquid whey as separate elements. This separation sometimes takes place with great rapidity, especially under the influence of great heat or sudden changes of the atmosphere, and not unfrequently before the butter particles have had time to rise to the surface.

The cheesy matter previous to coagulation is easily soluble in water, but after a complete coagulation has taken place it becomes insoluble.

The serum or whey is not left perfectly pure and free from mixture, but still holds in suspension some cheesy and butter particles which can be separated by ebullition. It also holds in suspension some alkaline elements, in a basis of potassa, and some sugar of milk amounting usually to about three and a half per cent of its weight.

The separation of the three chief elements of milk is much more readily effected in that of the cow than in that of other animals, and the apparent affinity which they have when first drawn from the udder is only instantaneous, since the separation commences even before milk has left the udder, and is continued with considerable rapidity as soon as it comes to rest in a favorable position.

When subjected to great heat, or when brought to a boiling point, milk loses its finest and most delicate properties and its flavor or fragrance.

The number of stomachs or powerful digestive organs of the cow, and of the ruminating animals generally, is wonderfully adapted to promote the largest secretions of every kind.

The specific gravity of milk is greater than that of water, that of the latter being one thousand, and that of the former one thousand and thirty-one on an average, though it varies greatly as it comes from different cows, and even at different times from the same cow. A feeding of salt given to the cow will, in a few hours, cause the specific gravity of her milk to vary from one to three per cent.

Milk will ordinarily produce from two to fifteen per cent. of its own volume in cream, or, on an average, not far from twelve and a half per cent. Eight quarts of milk will, therefore make about one quart of cream. But the milk of cows that are fed so as to produce the richest milk and butter will often far exceed this, sometimes giving over twenty per cent. of cream, and in rare instances twenty-five or twenty-six per cent. The product of milk in cream is more regular than the product of cream in butter. A very rich milk is lighter than milk of a poorer quality, for the reason that cream is lighter than skim-milk.

Of the different constituents of milk, caseine is that which in its composition most resembles animal matter, and hence the intrinsic value of cheese as a nutritive article of food. Hence, also, the nutritive qualities of skimmed milk, or milk from which the cream only has been removed, while the milk is still sweet. The oily or fatty parts of milk furnish heat to the animal system; but this is easily supplied by other substances.

Managing Cows in Holland.—From a condensed report of Dr. Staring, in the London *Field*, on the Dairy Husbandry in Holland, we make the following extract:

In the dairying districts—mostly exposed tracts of land without a tree—the usual plan of protecting cows against the cold and wet is to fasten round their bodies a thick tow cloth, and occasionally a rough shedding is erected to serve them as shelter. On their return to the stables they are attached by the neck to two stout posts, having movable rings which slide up and down as the animal changes its position. The usual arrangement is for the cows to stand face to face in two rows. Between the latter runs a feeding passage, and behind the cattle there is a channel and plenty of room to remove the droppings. From time to time pea, rye, barley and oat straw are substituted for a change, and either rape or linseed cake—about a cake a head—is dissolved in the water they drink. Some farmers, however, prefer to give the cake in its dry state, thinking it goes further in that way, and is more wholesome. Turnips are not much grown or used as cattle food in the dairying districts; they are occasionally given, however, as a supplementary article of diet, also beets, carrots, white and red clover, and spurry; and in the vicinity of towns the refuse of breweries and distilleries is a common feeding material.

The calves are never allowed to suck, and receive for the first four weeks pure milk, after that sour milk, buttermilk, or whey, according to circumstances. At the end of four months the same nourishment is given them as to the full-gaown cattle; but they often get sour milk, etc., besides. In those localities, such as the neighborhood of Nykerk and Nymegen, in Guelderland and Veghel, and Breda, in North Brabant, where the fattening of calves is largely and successfully carried on, the usual plan is to put them directly after birth into small pens or boxes, which are just large enough for them to stand up and lie down in, and kept dark. The calves get twice a day as much fresh drawn milk as they can consume, and for the first week each animal is fed exclusively on its own mother's milk. Such importance do some farmers attack to the calves consuming nothing but milk, that they muzzle the creatures in order that they may not chew and swallow any of the litter. A calf fattened in the above way will weigh in ten to twelve weeks, fat and lean together, 150 to 200 pounds.

Give Plenty of Food to Cows.—It is probably true that fifty per cent. of the profit which might be realized from the dairy stock of this country, is annually lost to their owners, from want of the necessary quantity and the proper quality of food which should be given them. L. F. Allen gives experiments by Dr. Rhode-Eldena, of the Royal Academy of Agriculture, in Prussia, of the comparative yield of milk from cows, by pasturing and stable feeding, or soiling, through seven years of each system. The average per cow for the whole seven years in pasturing was, 1,583 quarts, while the average per cow for the seven years of stabling or soiling, was 3,442 quarts. From this result it is seen that the cow is capable of producing one hundred per cent. more than she usually does, provided she is kept in the most comfortable manner, and fed with the greatest milk-producing substances, She may produce but half of the above quantities if not properly housed in the Winter, and scantily fed during the whole year. In either case, the original cost or value of the cow is the same; the care is about the same, while all the loss in her production is caused by a lack in quantity and quality of food, coupled with a lack of comfort during the inclement seasons of the year.

A farmers' milk company, with $200,000 for disposing of the farmers' milk in New York without the aid of middlemen, has started business in Connecticut. This is one of the most important enterprises to the farmers of the Housatonic, Shepang and Naugatuck valleys that has been undertaken. If it succeeds as its projectors anticipate, the milk distributing business in New York city, it is supposed, will go into the hands of an honest company, controlled by the farmers themselves. Thus the ball is rolling.

There are now in the State of New York more than 500 cheese factories, using the milk of over 200,000 cows.

Franking a Horse.—The only one of Col. Dodd's old associates who is living, is Mr. Charles Forrester, the present superintendent of the newspaper department in the Postoffice. He remembers when Col. Reeside, the great mail contractor of former days, had to bring a horse behind his mail coach from Washington to New Jersey as mail matter. The animal was forwarded by a member of Congress, under the franking privilege.—*New York Sun.*

Poultry Yard.

Eggs vs. Meat.

WOULD it not be well to substitute more eggs for meat in our daily dict? About one-third of the weight of an egg is solid nutriment. This is more than can be said of meat. There are no bones and tough pieces which have to be laid aside. A good egg is made up of ten parts shell, sixty parts white and thirty parts yolk. The white of an egg contains eighty-six per cent. water; the yolk fifty-two per cent. The average weight of an egg is about two ounces. Practically, an egg is animal food, and yet there is none of the disagreeable work of the butcher necessary to obtain it. The vegetarians of England use eggs freely, and many of these men are eighty and ninety years old, and have been remarkably free from illness. A good egg is alive. The shell is porous, and the oxygen of the air goes through the shell and keep up a kind of respiration. An egg soon becomes stale in bad air, or in dry air charged with carbonic acid. Eggs may be dried and made to retain their goodness for a long time, or the shell may be varnished, which excludes the air, when, if kept in a moderate temperature, they may be kept good for a number of years. The French people produce more eggs than any other, and ship millions of them to England annually. Fresh eggs are more transparent at the center, old ones on the top. Very old ones are not transparent in either place. In water in which one-tenth of salt has been dissolved, good eggs sink and indifferent ones swim. Bad eggs float in pure water, The best eggs are laid by young, healthy hens. If they are properly fed, the eggs are better than if they are allowed to eat all sorts of food. Eggs are best when cooked four minutes. This takes away the animal taste that is offensive to some but does not so harden the white or yolk as to make them hard to digest. An egg, if cooked very hard, is difficult of digestion, except by those with stout stomachs; such eggs should be eaten with bread masticated very finely. An excellent sandwich can be made with eggs and brown bread. An egg spread on toast is fit for a king—if kings deserve any better food than anybody else, which is doubtful. Fried eggs are less wholesome than boiled ones. An egg dropped into hot water is not only a clean and handsome, but a delicious morsel. Most people spoil the taste of their eggs by adding pepper and salt. A little sweet butter is the best dressing. Eggs contain much phosphorous, which is supposed to be useful to those who use their brains much.—*Poultry Review.*

SEX IN POULTRY.—The following is from a correspondent of the London *Journal of Horticulture:*

One of your correspondents revives the old question about the sex of eggs; I send my experience. Last year an Old Country poultry-keeper told me he could distinguish the sex in eggs. I laughed at him, and was none the less skeptical when he told me the following secret: "Eggs with the air bladder on the center of the crown of the egg will produce cockerels; those with the bladder on one side will produce pullets." The old man was so certain of the truth of this dogma, and his poultry yard so far confirmed it, that I determined to make an experiment upon it. I have done so, carefully registering every egg "bladder vertical," or "bladder on one side," rejecting every one in which it was not decidedly one or the other, as in some it is only very slightly out of the center. The following is the result: Fifty-eight chickens were hatched, three are dead, eleven are yet too young to decide upon their sex; of the remaining forty-four every one has turned out exactly true to the old man's theory. This, of course, may be an accidental coincidence, but I shall certainly try the experiment again. I am now trying the same theory upon ducks' eggs.

A Westchester, Pa., man gives the results of his experiments as follows: Last Summer I hatched 122 chicks from eggs selected on this principle, 119 of which were pullets. I always select eggs of medium size, believing them to be the best for this purpose. I then get a large kerosene lamp and take an egg in my right hand, between the thumb and two forefingers, big end uppermost, and hold it as near the light as possible; then lay the little finger of the left hand across the middle of the middle of the egg. This will throw the light in the egg; then turn it around slowly, and you will perceive a dark spot the size of a three-cent piece, directly in the center of the large end, or on one side. As I raise poultry for eggs and for market, I of course set only eggs for pullets, with a few for cockerels to replace the cocks of last year. It would be well for an amateur to break a few eggs, empty out the contents, and examine the large end, where the sir chamber in the dispositions will be distinctly seen.

THE principal points by which to discern the quality of the flesh in a fowl are, says the *Cottage Gardener*, the color of the feet and the kind of skin. The yellow foot generally indicates a fowl with tough flesh, heavy bones, and yellow fat. It is very rare that this color does not show itself in the skin. However, it does not exclude certain qualities of the flesh in the pure descendants of the two exotic races, Cochin China and Brahma Pootra. With the exception of yellow and green, which can never be recommended, all other colors, from black to white, are equally indications of an excellent flesh. When the skin, and, above all, that of the sides and breast, is of a fine tissue, delicate and easily extended, also having a rosy-pearled color, one may be certain that the flesh is good, and will fatten rapidly.

GAPES IN CHICKENS.—Some eighteen years ago I came to live on an old farm, where the gapes made such fearful ravages on the young chickens that it seemed almost needless any longer to set the hens. I came across the horse-hair remedy in the *Country Gentleman*, tried it, and the result was that I operated the first Summer on from fifty to sixty chickens with perfect success. Chickens very rarely have more than three or four worms, but I have taken as many as eight from young turkeys. Each year the number attacked decreased, till last year there were only two. None die from the treatment, but you need to take them when they first begin to gape. For a few moments after they leave your hand, after treatment, they will gape and sneeze a little, and then are as bright and lively as ever. It distresses me to read of so many losing their chicks when so simple a remedy will save them. Some think the horse hair cruel, but it is a mistake, and even if cruel, it is soon over. I take no particular care of my chicks, beyond cooping them, feeding them corn meal and giving water.

Remedy.—Take a stiff horse hair, make a pointed loop, insert it in the wind-pipe, push it down as far as it will go, with the rest of the hair between your thumb and forefinger; twist it quickly, then draw it out. You may not get any worm the first or the second time, but they loosen so that the third or fourth time they come; sometimes all three will come at the first drawing. The operation must be done quickly; it needs two to do it—one to hold the struggling chick, the other to operate.—*C. B. S., in Country Gentleman.*

We have cured the same complaint by dipping a feather into kerosene and running it down the windpipe, twisting it around two or three times. It loosens the worms and the chicken coughs them out. It is an easy and sure cure.

TO INSURE THE HATCHING OF EGGS.—A correspondent of the *Poultry Record* gives the following plan as better than sprinkling eggs with water to insure hatching. It is sound, for it is well known that hens which make their nests on the ground are apt to bring off large broods. The earth keeps an equable warmth, and supplies the necessary moisture to the eggs:

I put about two or three inches of fine, moist earth into the box I want to put the hen in, press it down firmly, and have it a little deeper in the center, a handful of straw or hay on top of it, and the nest is ready to receive the eggs. The earth contains all the moisture necessary for the good of the eggs. If your box is deep, more earth may be put in, a foot deep will do no hurt. You say wheat screenings are poor food for chickens. My experience is different. I consider them the best and healthiest food, and use them almost exclusively, and only give a little corn at night. Wheat screenings will make the hens lay, keep them from getting broody, and, I think, will in a great measure prevent cholera.

No amount of care in preparing the nest or moistening the eggs will insure a large brood if the eggs are not good. After eggs have been under the hen three days the germ becomes sufficiently developed to make it determinable whether the egg will hatch or not. They may be examined at this stage, by holding before a light, and those which show no evidence of fecundity discarded and replaced by fresh eggs. Care must be taken not to handle them too much, and fresh eggs should not be placed in the nest later than three days after the hen begins to set, or she may leave the nest before they are hatched.

WHEN poultry is kept in a yard, it is best to dig up a small corner occasionally to let them hunt for worms and beetles, and then sow it in oats and corn and lettuce. They always want a dusting place; a box of ashes with sulphur intermixed is what they need for this.

That farmers and manufacturers are mutual producers and consumers—that is, that each is a consumer of the other's products—is quite plain. It ought to be equally plain that it is for their mutual advantage and profit that they be in juxtaposition. The cost of transportation between them is a tax on both, and it increases with the distance between them. If the price were fixed to the producer, whether of agricultural or mechanical products, then the cost to the consumer must increase with the distance between them; if the price were fixed to the consumer, the profit to the producer must be diminished as the distance between them increases. As a matter of fact, the cost of intervening transportation is a tax which is divided between them, and this would still hold true were that cost reduced to its minimum. To transportation companies and middlemen distance may "lend enchantment to the view," but he is an unwise farmer who does not do all in his power to encourage manufacturers to locate beside him.

FARM MACHINES.—The *World* says: Knowledge of machinery is becoming one of the most important requisites in a farmer or a farmer's help. No machine should go upon any farm without the farmer comprehending it in all its parts, the requirement and relation of each part to the other, how to adjust and care for it, how to remedy difficulties that may arise, ank keep the whole machine in proper working condition without the aid of a machinist, unless in exceptional circumstances. It should be the first duty of the hired help to learn the same lesson, if he is to be intrusted with the machine's use. This is urged as a matter of economy. It is frequently the case that a non-observant farmer loses the time of his men and his own, besides making a bill at the blacksmith's or machinist's, when a little gumption and ten minutes' time properly applied would have saved all loss.

Apiary.

Bee Culture in California.

Up to the time of the influx of the gold hunters in 1848-9, says the Sacramento *Record*, the honey bee was unknown in California, and if was as late as 1856 or '57, we think before any were introduced. The first brought into the country found a profusion of wild flowers every where and as a consequence increased in numbers with a rapidity unparalleled in the history of bee-keeping, and made a quantity of honey theretofore unheard of by the most experienced apiarians of the world. While this honey lacked the peculiar and familiar flavor of the white clover and other cultivated crops of the Eastern States and Europe, it was still of an excellent flavor and unexceptional in color, and of course in a new country, where delicacies and luxuries had been scarce and costly, commanded a good price and found a ready market. This attracted the attention of speculators who knew nothing of the science or art of bee-keeping, and soon the country was flooded with bees imported from all parts of the Eastern country. Having been subjected to improper treatment, want of ventilation, sweating, etc., on the passage, and not being properly cared for on arrival, the worst kinds of bee disease soon became very prevalent, and for a number of years the mortality more than equaled the increase. This unexpected turn in the business brought the value of stands or hives down from the speculative price of from $100 to $130 each, to which they reached at the high tide of excitement, to a mere nominal sum, and those who had rushed into the bee business now as anxiously and hurriedly rushed out of it. Many who could not sell their stock at any price simply abandoned them to take care of themselves.

A few men, however, who had been trained to the business, and who entered into it at first as a legitimate business, believing they could with careful management make it pay them a proper return for the investment of their means and their labor, worked right along through all this excitement and speculation, and through the following depression, keeping their bees in a healthy condition, and adopting all the improvements in hives and in management, and increasing their stock and improving it by the substitution of the yellow Italian for the black German bee, and barely paying their expenses from the products of their apiaries, and looking to outside operations for the maintenance of their families. To add to the discouragements and difficulties of these few men who had once been cheated out of the fair and natural reward for their enterprise and labor by the over-speculation and then the following depression, just as they began again to see a better time coming, when they should have a clear field in which their bees could gather honey, and a growing market for the products of those bees, another difficulty, more serious because more permanent than the former stared them in the face.

The open country that had formerly been covered with wild flowers upon which the bees had fed, and from which they had gathered the only good honey, was now being appropriated for stock or for wheat, and for other agricultural purposes. The whole natural bee food was being rapidly destroyed, and none of the crops cultivated supplied the place of it. The peculiarity of the California climate precluded the successful cultivation of the white clover so universal in the eastern country, and which there more than compensated for the wild flowers supplanted by it. With a large stock of bees on hand these few legitimate apiarist found themselves thus deprived of all feed for them, from which any paying amount of honey of good merchantable quality could be made. Then came the dividing up of the apiaries, and an attempt to adopt the nomadic plan of bee-keeping. Some were sent to the mountains and some towards the sea, among the tule islands. This plan gave hopes and some promise of success. A fair amount of pretty good honey was gathered some seasons in the mountains, but the prevalence of the buckeye in these districts, a deadly poison to the bee, was found a great drawback, and finally compelled the abandonment of these fields. A fair amount of honey was gathered from the low tule lands, but of poor quality. As a consequence of these discouragements, the number of those who persevered in the business was continually growing less.

About five years since, however, J. S. Harbison, the leading apiarist of the State, made a trip through the southern counties in search of bee pasture. He found such good promise that soon after his return he removed a small apiary, in the ownership of which he had associated a Mr. Clark with himself, to San Diego. These were the first bees in that county. The success with which this small venture was attended has induced Mr. Harbison to gather up all his bees from all other localities and transfer them to the same county. Mr. Harbison has now in that county two thousand hives of bees, which last year produced 150,000 pounds, or 75 tons of surplus honey of a very excellent quality. Of this he has shipped per railroad over 60 tons to the Eastern States, mostly to Chicago and New York. His sales of honey for the year will equal the nice little sum of $30,000.

This places Mr. Harbison the foremost bee man in the world, so far as money making from the business is concerned, and he undoubtedly occupies the same position as to the knowledge of the business, there not being in the world his equal in this respect. The labor in and about all his apiaries is now done by apprentices, who are availing themselves of the opportunity to learn the business while their labor pays their personal expenses. Eight young men are thus engaged, and some of them have become so expert as to be intrusted with the entire management of some of his apiaries. Other parties, since they have learned the success attending the bee business in San Diego county, have also removed a large number there, and good judges estimate the product of the apiaries of the country last year at $100,000.

Extent and Nature of Bee Pastures.

The bee pastures of the southern counties extend from Santa Barbara to Lower California, occupying a belt of country about eight miles wide—commencing about on an average of ten miles from the coast—approaching nearer or receding further back, according to the topography of the country. This belt is a very irregular, broken mountainous country, mostly unfit for general agricultural purposes, and on this the bee-keepers place their hopes of immunity from the encroaches which have proved their discomfiture in other portions of the State. Experience has shown that the best localitics for the apiary is neither at the highest elevation or deepest depression, neither on the mountain nor in the valley below, but at a point half way between the two. At this point a medium temperature is secured, and the bees are thus placed where they have access to the earliest food in the valleys below and the latest on the mountain above. The distance the bees have to fly to obtain their food is thus divided, which is no small consideration. One can appreciate this last proposition when he reflects that the bees of Mr. Harbison last year gathered up and carried to his several apiaries 150,000 pounds of honey. The honey is gathered from a great variety of flowers, but the chief dependence is on a species of white sage which is found in great abundance on the entire range of country, from Santa Barbara to Lower California, averaging about eight miles wide.

The bee men are rapidly taking up and occupying the best locations in all this region. They are laying out the proceeds of their enterprise and labor in permanent improvements and are preparing to make permanent homes. Though the principal business and dependence is the apiary, they all cultivate some land and keep some cows, some horses and hogs, and some of them some sheep. We are informed that the bee men alone have done more in the settlement of the county of San Diego than all other classes, in the past five years. The land being occupied by the bee-keepers has not yet been surveyed and put into the market by the General Government, but they are taking it up with a view to preempting it as soon as they can do so, and we understand they propose asking Congress for special legislation to enable them to obtain title to large tracts each.

Nature of Bees.—Mr. S. S. Landers communicates to the *Christian Leader* a long article on bees, from which we make the following extracts:

The bee has never failed to attract the attention and study of all naturalists, and of all who feel an interest in the works of nature. Their skillful work seems to manifest the intelligence belonging to the higher orders of animals, and even to surpass, is some respects the intellectual faculties of man.

In a perfect hive of bees, there are three kinds. The "queen," the mother of the whole colony, the "workers," of the neuter gender, those that do all the work, and the "drones," the male bees, who take up room in the hive, live on the products of the worker, but bring in no honey. These three kinds of bees have very different organizations and instincts, and their offices in the hive are entirely different, and yet each is necessary to the others, and all are indispensable to the existence and continuation of the colony.

The queen is a fully developed female. In all animated nature, we usually find the male and female of about the same number, but bees are an exception to this law. Here there is but one female to many hundreds of males, and many thousands of workers which are of neither gender.

The queen is impregnated by copulating but once in her lifetime with the drone while on the wing, high up in the air, and in forty-six hours after her fecundations, all things being right, she begins to lay eggs, and it is stated by those who profess to know, that she is capable of laying 2,000 eggs in twenty-four hours. Huber, a blind Swiss naturalist of great celebrity, advocated the idea that the ovaries of the queen contain a regular succession of the different kinds of eggs necessary to produce the three kinds of bees we find in a hive. He made an experiment which proved to him that if the hive contained no drone comb, she dropped her male eggs at random, and no males were produced, and so if there was no worker comb, she dropped her worker eggs anywhere, and no workers were reared. This, in substance, if the theory of Professor Agassiz, as advanced in his lecture, "Life in the Bee Hive."

But the most generally recognized opinion on this subject now is, that the eggs of the queen are all alike, and that it is only the different kind of cells in which they are laid whether drone or worker, and the different kinds of food and treatment they receive from the workers in their embryo state, that make the three kinds of bees. If this theory be true, and it has many facts in its support, the queen has no knowledge of the kind of eggs she is depositing in the different cells, nor does she know what kind of bees they will produce. And yet there are facts which favor the other side of the question.

The fact that all eggs laid before fecundation produce drones only, seems to favor the Huber theory. The queen has a sting which she only uses to sting another queen. She can be handled without any more fear of being stung by her than by a drone, which has no sting. She lives four or five years, if no accident happens to her; but in the latter part of her life she ceases to be prolific, and the colony procced at once to raise another queen to take her place. This they do by building a queen cell, and if when the cell is about half

done, the queen does not lay an egg in it, they take one from a worker cell and put into it, or they build a queen cell around a worker egg in a worker cell, and by feeding the insect in its embryo state with royal food, a sort of creamy-like substance, and perhaps by some other process known only to themselves, the egg that would have become a worker, if it had remained in a worker cell, becomes a queen. The office of the queen in the hive seems to be only to lay eggs. She has no care for them after they are deposited in the cells, but all such as the workers convert into queens she is sure to destroy, unless in some way prevented, if she does not go out with a swarm before the young queen is sufficiently advanced in its cell to be regarded as a rival. She has power over her ovaries so that she she can lay eggs or not, as circumstances in the hive make it necessary or not. A queen in a large colony, when honey is being brought in abundantly, will lay five times the eggs that the same queen would in a small colony under reverse circumstances.

One other mysterious fact I would name here, is that the egg from which a queen is reared is hatched into a perfect bee in sixteen or seventeen days from the time it was laid, whereas if a worker had been reared from that egg, it would have taken twenty-one or twenty-two days. The different food and treatment the queen grub receives not only alters the gender of the bee, its shape and size, but also makes a difference of four or five days in hatching. The drone is the male bee and has no sting, no means of gathering honey, nor of secreting wax, nor of doing any kind of work for the common good of the colony. Like some in human society, they are non-producers, living by others' toil and industry, regular gentlemen loafers. Their only use is to fecundate the queen, and keep up by their presence in the hive the necessary animal heat to rear the brood. They live one Summer and are killed off in the Fall.

The workers are imperfectly developed females, and they do all the work that is done in the hive. They secrete the wax from their own bodies, and build it into comb; they gather the pollen for the young and the honey for all; they feed and rear the brood; they fight all the battles necessary to defend the colony against harm. They live but a few months when the weather is such that they cannot go out. They have eyes by which they can see in daylight, but all their mysterious work in the hive, which has surpassed the skill of all mechanics, and excited the wonder of all naturalists, is done in perfect darkness, where eyes of common structure can be of no use.

A swarm of bees have established themselves on the top of a Cincinnati church steeple. What a chance for a sermon on the beatitudes, and what a hint to the congregation that they should humble be!

A Gardener's Lesson.

Two gardeners had their crops of peas killed by the frost. One of them was very impatient under the loss, and fretted about it very much. The other went patiently to work at once to plant a new crop. After a while the impatient, fretting man went to his neighbor. To his surprise he found another crop of peas growing finely. He wondered how this could be.

"These are what I sowed while you were fretting," said his neighbor.

"But don't you ever fret?" he asked.

"Yes, I do; but I put it off until I have repaired the mischief that may have been done."

"Why, then you have no need to fret at all."

"True," said the friend, "and that is the reason I put it off."

Some men, like flowers, are fitter for a corner than a full light.—*Seneca.*

Floricultural.

Ferns as Window Plants.

Few plants require less attention and yet give more satisfaction to dwellers in towns than do the hardier descriptions of ferns. From the fact that many of them are greenest and best in Winter, when other plants are out of bloom, their culture ought to be patronized by the poorer classes who cannot afford more expensive plants. Among the limestone formations of North Lancashire the fern commonly known as Stag's-head is very numerous and luxuriant. The beautiful green fronds grow to a length of twelve to eighteen inches, and many of them, when cultivated in pots, fork so as to be rare and beautiful ferns, the tips of the fronds forming into a bunch. I would call the attention of city horticulturists to the fact that these ferns might be gathered at a very trifling expense and sent to town by wagon loads, seeing that the hedges are full of them in the district named. Arrived in the cities, they may be potted, and a good profit realized from the sale at from 9d. to 1s. per pot. They will live for many years, and would form a "thing of joy" in many humble homes, to the dwellers in which the sight of a green leaf is a pleasure. The beautiful little Maidenhair, Royal, Parsley and other ferns are equally common in the district.—*London Field.*

There are several varieties of fine ferns in California that can be easily transferred from the wild glens to the sitting-rooms of our people. They will grow with moss in hanging baskets or in pots. The best thing is a stand, such as is described in the following article, only a plant stand for ferns should be covered with a glass case to grow ferns in full perfection. A simple frame can be made to hold the glass frames.

A Plant Stand.—The lack of a desirable place to keep plants often prevents the pleasure of raising them. They must have light, and air, and sunshine, and it is not always convenient to devote the brightest windows to their occupancy. If kept on the ledges, they are in danger of being chilled on a frosty night; and it is a tax to be compelled to move the heavy pots every time the thermometer drops. A flower stand of some sort that can be readily moved from window to window is, therefore, a necessity. The old-fashioned wooden ones are clumsy, heavy, and take up too much room. The modern wire frames are pretty and light; but one of moderate size costs ten or twelve dollars, which is a great deal to put in the stand when we wish to put it in the flowers.

We saw something, the other day, that seemed to serve both economy and convenience. A box three feet long, a foot and a half wide across the bottom, and eighteen inches deep; is made of common pine. The sides flare outward, so that, at the top, they measure six or eight inches more, from edge to edge, than at the bottom. The box stands on four legs with casters, and under the bottom of the box, a piece of wood fancifully cut on the edge (a sort of pine valance), holds the legs firmly and firmly and symmetrically together. The top of the box is nearly even with the window-sill, and when the whole is constructed, it may either be painted in colors or stained dark-brown, to match the furniture wood. The inside of the box is better preserved from decay, if lined with zinc or tin; but it will last one, possibly two seasons, without any lining at all. Over the bottom is spread a three-inch layer of bits of broken flower pots, and on this is set a double row of pots, or as many as will stand evenly on the surface. Then a thick layer of sand is poured over the broken pieces, and the rest of the space filled up with earth till it is even with the top of the flower pots. In the bed thus formed, bulbs or slips are planted between the pots, and vines are started at the corners. When the latter are well under way, wires, on which the vines twist, are fastened diagonally from corner to corner, forming a beautiful green arch over what seems to be a bed taken thus bodily from the garden. Sometimes a tiny hanging basket, or an ivy growing in water, is hung from where the wires cross in the arch, but, even without it, there is no appearance of barrenness. A carpenter will make the box for two dollars and a half, and the rest, painting and all, can be readily done at home.—*Ex.*

Soil for Floriculture.—Most flowers, if not all, succeed best in sandy loam, made rich by the addition of well-rotted manure, which should be thoroughly mixed with the soil. Such a soil, thus prepared, will not become hard or baked, but will become loose and porous. It will not only afford the small and tender plants a chance for existence, but it will also enable them to perfect themselves with vigor and beauty. If your garden is composed of a stiff, heavy soil, a good dressing of sand and manure will assist it wonderfully in the way of plant development; and some of the most delicate plants, that would not succeed at all in such soil, in its unimproved condition, will, after such preparation, flourish in the most satisfactory manner.

Sand and Water for Cuttings.—The *Revu Horticole* recommends the following mode of striking the cuttings of soft-wooded plants: Take a flower pot saucer, fill it with river sand, and place the cutting in the same, having first saturated the whole with water. The saucers are put in a sunny place, and always kept full to the brim with water. Almost any kind of cutting will grow then.

This method of striking delicate cuttings is the best we know of, and is practiced by gardeners in California. Any kind of a saucer or deep plate will do to use.

Salt as Manure.

Various experiments have been made by M. Peligot and others in Europe to test the value of salt as a manure. The following summing up seems to have been arrived at:

Salt should never be applied other than in a pulverized state, and never be employed on impervious, cold and humid soils. The best manner to use it is to combine it with other manures, a dose of 200 weight to the acre being sufficient. When to destroy insects it should be applied before sunrise. In the case of cereals, salt strengthens the stems and causes the ears to fill better, and favors the dissolution and assimilation of the phosphates and silicates. It acts vigorously on potatoes; it can be detected in their ashes to the extent of one-half of one per cent. Asparagus is a veritable glutton in the presence of salt. A dose of 300 pounds per acre acts without fail on beets, injuring its value for sugar purposes but enhancing it for the feeding of cattle. Colza has as marked a predilection for salt as asparagus, and in Holland, where the culture of peas is so extensive, salt is something like a necessity. Mixed with hay in the proportion of a quarter of a pound to a hundred weight, the fodder is rendered more appetizing; but the best way to feed it to animals is to allow them to enjoy it in the shape of rock salt. It is calculated that a horse appropriates daily one-tenth of an ounce of salt, an ox one-half that quantity, and a sheep and a pig one-half that required by an ox.

A man in Stark county, Ind., pays his boy ten cents a quart for potato bugs, and the boy says if next year is as good as this he can buy the old man out.

Porcine.

Wheat and Vegetables for Hogs.

A FARMER in Tennessee writing to the *Rural Sun* tells how a neighbor fattened his hogs on *wheat* with turnips. Any other vegetable with wheat would do as well as turnips, which are less nutritive than mangle wurtzels and other beets, which will grow in California better than turnips will, and with greater profits for feed.

Beets sown on good soil in February or the latter part of January on the dry lands in California will, by the advantage of an early start and fair growth before the end of the rainy season, make a good crop where wheat or barley will grow without irrigation. Any farmer that can grow wheat can grow beets, and wheat and beets together are as good as wheat and turnips.

We venture the assertion that wheat is the best single grain to fatten hogs on that grows, and also that there is no branch of farming that will pay better in this State, where not one-sixth of the pork used is produced, than raising and fattening hogs.

Our soils are prolific, and with proper management can be made to produce as much solid hog-feed to the acre as the corn lands of Missouri, in wheat, peas and barley, and beets and squashes.

We extract from the letter in the *Rural Sun*, and hope our farmers may be instructed to their good:

FAT HOGS—TURNIPS AND GROUND WHEAT. Col. Boyd of Marshall county failed in his corn crop this year, and is fattening his hogs on turnips and wheat. He cuts up the turnips and tops, to which he adds one bushel of ground wheat for each twenty hogs, as the daily rations, the turnips in quantity as much as they will eat. The mixture is thoroughly cooked and fed cool, on which he thinks he can make his hogs *as fat in sixty days as he could on corn in ninety*. He has never known hogs to fatten as rapidly when fed on corn or any thing else. To feed twenty hogs ninety days, the usual time, would require at least fifteen bushels of corn each, or *three hundred bushels* for the twenty. Col. Boyd, to reach the same results, would feed sixty days and consume *sixty bushels* of wheat, added to a full supply of turnips, which are of but comparative little value. You see in fattening twenty hogs, a *clean saving of two hundred and forty bushels of grain* by Col. Boyd's mode of feeding turnips and *wheat*.

FEEDING SWINE.—One of the important things in feeding hogs, and indeed all animals, is to feed regularly. They have no clocks, and are not supposed to observe the sun and stars very closely, still hogs are not ignorant of the flight of time, and they reckon very accurately as to the hours for meals. If accustomed to be fed at six o'clock in the morning, twelve at noon, and six at night, they want their food pretty promptly at these hours, and will grunt and grumble if they don't have it. This grumbling must be avoided, for it wears off more flesh from men and hogs than is commonly supposed. We have been amused on going into hog pens, when the hogs are fed regularly, to notice how little attention they pay to visitors at any time except meal hours. They sleep right on, and it sometimes requires some hard pokes to arouse them, and when aroused they are as apt to make for the door as the trough. On the other hand, hogs fed irregularly are on the *qui vive* to see if somebody has not brought them something good to eat. Hogs are creatures of habit, and they may be accustomed to two or three, or half a dozen meals a day. We should certainly prefer three to half a dozen. Feeding them every time we pass the hog pen, as is the custom of some, is a weariness to the flesh of both man and beast.

QUALITY IN PORK.—We all know what a difference there is in pork. Breed has something to do in this matter, but not so much as many suppose. It is the kind of feed that makes the quality in pork. Use milk or whey largely and your pork is sure to be soft, flabby, and will fry away at least half. What is left is not relishable. Hence our dairy pork is our poorest pork, varying according to the amount of grain that is fed. So still-fed pork is in bad repute. Miscellaneous feed makes ordinary pork, often quite ordinary. Slop will not do, there seems to be too much water.

The grains are what is wanted to make good, sweet pork—pork that is solid and will fry well. Rank pork is unendurable, and yet there is much of it, and some people like it, like the pork from large, strong hogs.

A dirty, offensive sty is an element, no doubt, of producing strong and even fœtid pork.

Have clean quarters, a clean animal, good ventilation and feed grain. For drink, give cold, not in any way foul, water. Do not house too closely, nor feed too sharply; look to the convenience of the hog, and fat him so that he is in good condition.

A HOG in Dubuque slipped up stairs into a house where a party was being held, and got into the room where the eatables were stored, which he proceeded to devour. The *Telegraph* says the hog was chased until he was caught, but the delicacies he had eaten could not be recovered. This is the strange part of the affair.

Pisciculture.

Care of Gold Fish.

WILL some of your readers answer the following questions: What is the average life of gold fish? Should the aquarium be set in the sun or in the shade? Do they need hard or soft water? Do they need to be fed daily? If so, what is the best food? M. B.

Seth Green is reported to have given the following directions for the management of gold fish: Use any well, creek or river water that is not impregnated with mineral. Change the water when the fish come to the top and stay there, and breathe part water and part air. Take out nearly all the water, leaving enough for the fish to swim in, and fill the vessel with fresh water. Never take the fish in your hand. If the aquarium needs cleaning, make a net of mosquito netting, and take the fish out in it. There are many gold fish killed by handling. Keep your aquarium clean, so that the water looks as clear as crystal. Watch the fish a little, and you will find out when they are all right. Feed them all they will eat and anything they will eat, meat, worms, fish wafer, or fish spawn. Take great care that you take all that they do not eat out of the aquarium. Any decayed meat or vegetable in the water has the same smell to fish that it has to you in the air. If your gold fish die, it is attributable, as a rule, to one of three causes—handling, starvation, or bad water.—*Rural New Yorker.*

THERE is something very sensible in the impromptu remark of a young lady: "If our Maker thought it wrong for Adam to remain single when there was no woman on earth, how criminally wrong are the old bachelors, with the world full of pretty girls."

The Greatest Crop in the World.

A question widely discussed involves the relative value of the wheat, cotton, tea and hay crops of the world. Which of these produces employs the greatest amount of the world's capital? It is said that hay leads the rest, and the items that enter into the account as stated are somewhat startling, and will make a Granger's hair stand on end. Cotton and tea are local crops, while hay is produced everywhere the world over, and thus the hay crop greatly out-weighs either of the other two. The aggregate reported value of all farm products in the United States, for 1870, was $2,447,538,658; but as this includes additions to stock, "betterments," etc., it is probably too high. Now, the hay crop for that year—that is, the grass dried and cured for use or sale—is reported at over 27,000,000 tons. This, at half the selling price in the large cities, would amount to $405,000,000, and is far greater than the aggregate home value of the cotton crop or any other crop. But the cured "hay" is but a portion of the grass crop. The other portion is used on the ground, and it requires considerable calculation to get at the value so used, even in the roughest way. In the first place, live stock, including horned cattle, horses, sheep, swine, etc., to the value of $1,525,000,000, were fed from it that year. Averaging the lives of these at five years, we have one-fifth of that sum as representing the grass fed to them in 1870, viz: $305,000,000; next we find the value of the animals slaughtered for food in that year to be $309,000,000, and as this is an annual product, the whole of it will, for the present, be credited to the grass crop; next we find that the butter crop of 1870 was 514,000,000 pounds, which, at the low average of 25 cents, amounts to $128,000,000, and this goes to the credit of grass; next we have 235,000,000 gallons of milk, which averaged at the low estimate of 10 cents per gallon, adds $25,000,000 more to the credit of the grass crop; then we have 100,000,000 pounds of wool at 25 cents per pound, adding $25,000,000 more; and, finally, 53,000,000 pounds of cheese, at 10 cents, adding over $5,000,000 to the total credits to the grass crop of 1870, which aggregates $887,000,000. Now, let us add the value of the "hay" crop as given above, viz.: $405,000,000, and we have a grand total for "hay" and the products of grass consumed on the ground of $1,292,000,000! This is, of course, subject to deduction, as the meat, butter, milk, cheese, and wool-producing animals consume other food besides grass and hay. To make ample allowance for this, we deduct the entire value of the corn and oat crops of 1870, estimated at $270,000,000, and this leaves a remainder of $1,682,000,000 to be credited to the hay and grass crop of that year, when the reported aggregate of all farm products was $2,447,528,658. If our estimates make even the roughest approach to accuracy, the value of that crop was two-fifths of the aggregate value of all farm products, and hence we may infer that two-fifths of the capital then invested in agricultural pursuits was devoted to the grass crop, and this, in the United States, equals (in round numbers) $4,575,000,000! From these figures the deduction is palpable that King Cotton is uncrowned and dethroned, and we may be forced to admit that all "flesh" and all else is hay, if not "grass."—*Hay, Straw and Grain Reporter.*

WASHING WINDOWS.—In washing windows or other glass, never use soap unless it can be thoroughly rinsed off; wash off the dirt in clean warm water; after the glass is dry, rub with a little paste or whiting and water, in the center of each pane. With another cloth rinse over the glass, then rub with a dry cloth till it shines like crystal.

The Sheep Herd.

Combing Wools.

THE following, by a correspondent of the *Rural New Yorker*, contains some practical suggestions that are worthy the consideration of California wool-growers:

Occasionally there comes into the Custom House Appraiser's office, from Australia, some combing wool of a much finer grade than the ordinary combing wool from the English blood sheep. I judge that it must be from a cross between the English long wool breeds, either Cotswold or Leicester, and the Merino of that section. The wool is very much sought after by those engaged in the worsted branches of manufacture, like delaines, shawls and various stuff goods; and as that branch is constantly extending there is not likely to be diminution of the demand for wools suited to that industry. Would it not greatly aid the sheep husbandry of the country if we were to diversify our breeds of sheep, and adapt them more to the demands of a rapid change in manufacturing industries. The improvements in machinery, and in taste and fashion, have wrought a wonderful change in the public mind relative to worsted goods. A careful examination of people's clothing satisfies me that at least nine-tenths of the textile fabrics worn by either sex are the product of the worsted manufacturers. When we know how worsted manufacture facilitates the mixture of other and cheaper material with wool, constantly cheapening the production, we need not be surprised at the rapid extension of the industry.

As at present conducted American sheep husbandry is of little aid to the home manufacturer in the great leading industries of the world. England is the great producer, as she is the great consumer, of worsted wools, and hence she monopolizes the markets of the world in the various worsted fabrics through the facilities for obtaining cheap raw material. "The rapid increase of the worsted manufacture as compared with the woolen is no doubt to be ascribed to the greater simplicity of the processes and to the recent introduction of combing machines, but most of all, to the introduction of cotton warps in 1835, which not only cheapened the goods but vastly increased the variety."

We can produce cheap cotton. Ought we not to so vary our production of wool as to place within the reach of the manufacturer cheap wool, and thereby successfully compete for the markets of the world in textile fabrics? If we will adapt our sheep husbandry more to the English system of making meat, and not wool, the great object, and choose those breeds which are so valuable for mutton as well as for combing wools, we can, on our cheap lands, and with our universal good market for meat, grow wool much cheaper than it can be produced in England and largely extend our manufacturing and cognate industries.

Going more into detail, it seems to me a capital crop may be made upon our grade Merinos by judiciously selected South Down males, and in certain sections, like the Vine Grass regions of the South, with the long wool varieties, enhancing the business profits by the increased income both in his wool and meat. For it is not to be disguised that good combing wool, whether from South Downs or Cotswolds, is worth much more in the markets than the fine clothing wool of the Merino, while the increased weight adds largely to the profits in the carcass.

EVERY FARMER SHOULD BE A SHEEP-GROWER.—There are many reasons why every farmer should keep a small number of fine-wool sheep on the farm. By raising his own mutton a large saving is made in the butcher bill; the sale of the wool will always bring ready money. Besides these reasons there are many others. Sheep are the best scavengers that can be kept on a place, and in two years' pasturing on a foul piece of ground will destroy the weeds that will defy any other method to exterminate. Weeds are the greatest absorbents of moisture we have, and where they grow among other crops soon deprive the plants of all moisture, when they wither and die. When sheep husbandry shall become in this State a part of the farm operations, we will have a much higher standard in the quality of wool produced than under the present system. When breeding on a small scale, the farmer will have time to cull out worthless stock and breed only those that are known to be good. All thoroughbreds, of whatever stock, do not produce good animals, and in breeding this fact must be remembered. Where there is a herd of a thousand or so it is impossible to pair the males and female so as to produce good offspring. Every year we are gaining ground in the matter of raising fine stock; but until every farmer is a stock raiser we shall not have reached the point of perfection. Every farmer should be a wool-producer, a dairyman, a hog-raiser, and a stock-drover on a small scale. It is much easier to drive hay to market when it has legs under it than to bale it and ship on the cars. We do not advocate the feeding of wheat to beef cattle or hogs, but we do hold that the wheat should be sent to mill by the producer, and the bran and shorts retained and fed to stock and converted into pork, beef, butter and cheese. And there are other products more profitable than wheat which it will pay to feed stock.

The foregoing, from the *Sacramento Valley Agriculturist*, contains much hard sense pertinent to the question. We differ only in one thing: we *do* believe in, and advocate feeding wheat to stock, in localities long distances from market. There is no better feed for hogs and chickens, and it is economy to convert wheat into pork, beef, mutton, etc., where it grows luxuriantly and the price it commands is below $1\frac{1}{4}$ cents per pound.

WHY JOHNSON'S COTSWOLD RAM DID N'T TAKE THE PRIZE.—MAX ADELER writes to the *Danbury News* thus:

Our county fair is just over, but Johnson's Cotswold ram did not take the prize that was offered for the best animal of that kind. Judge Pittman was Chairman of the Committee on Rams, and he manifested the deepest interest in Johnson's ram, indicating clearly that if any sheep ought to take a prize that one certainly ought to. Johnson's ram was by itself in a pen with a high board fence, and before adjudicating the prizes the Judge thought he had better go in and make a close examination of the animal for the purpose of ascertaining the fineness of its wool, etc.

As soon as the Judge reached the interior he walked towards the ram, whereupon the ram lowered his head and began to shake it ominously. Just as the Judge was about to feel the fleece the ram leaped forward and planted his head in the Judge's stomach, rolling him over on the ground. Before the Judge had time to realize what had happened the ram came at him again and began a series of promiscuous butts, each given with the precision and force of a pile-driver. It butted the Judge on the back, on the ribs, on his arm, and on his shoulder-blades, on the bald place on his head, on his breast, on his shins; it butted his nose, it butted his watch into a mass of loose cog wheels, it butted his spectacles off, it butted his hat into black silk chaos; it butted him over into the corner and up against the fence, butted down another of the committee, butted three small boys into fits, butted the money taker at the gate, and then fled out into the country, butting harmlessly at the fresh air.

The Judge did not distribute the prizes that day. When they collected him from various parts of the pen, they wiped the mud from his trousers and the blood from his nose, and sent him home with a perennial stomach-ache and a determination to start after that wandering mutton, the first thing in the morning, with a shotgun.

WE were amused, says the Colorado *Chieftain*, at the novel and ingenious manner of corralling a flock of thirteen hundred sheep. It consisted of bunching them together and running a canvass fence around them. The canvass was fastened between two small stakes, each pair set about ten feet apart. The canvass is about two feet in width, and the lower edge is calculated to be about eight or ten inches from the ground. The stakes extend so far below the canvass as to allow of their being set far enough in the ground to keep it in upright position. Like a fish-net it can be taken down, rolled up and put away in the wagon. It is certainly a very convenient way of corralling sheep of nights while driving long journeys. They may be made to hold two or three thousand in a bunch. This novel fence was invented by A. S. McWilliams, of Colusa county, California.

When to Sell Wheat.

If farmers could always know with accuracy just the amount of old grain and flour left over, and the true condition of the crops all over the world, so that they might be able to judge of the ratio of supply to demand, they would be prepared to decide whether the early market is what it ought to be or not; but so long as there are grain speculators all over the world trying to bear the market by exaggerated statements of the amount of the old crop left over in the great grain centres of the world, and with over-estimates of the new crop, they are left without a reliable guide.

There was a time when speculators were able to subsidize almost the entire press, and procure such crop statements as should suit their own interests and mislead the farmers, but the time for that, we trust, is rapidly passing by, and the time rapidly approaching when the intelligent farmer shall be quite as well informed upon the prospective condition of crops and markets any other class. When the farmer shall have become thoroughly informed upon all questions liable to affect the prices, he will be a great deal better prepared to decide when to sell his crops than he has been or is now.

Perhaps we may lay it down as a general rule, that when the last year's crop has been, generally, a short one, and the present one is abundant, the early market will be the best; but when the last one was abundant, and the current one is short, the latter markets will higher.

THE possession of vast tracts of land by one man, or the ownership of sufficient area to make a county, if not a good-sized state, when vested in two or three men, precludes the possibility of small farms ever being reached. Yet this is the situation in California to-day, and instead of being remedied, is constantly increasing, and the degradation consequent upon this condition of things is sure to follow. It has been generally admitted that the crying sin of other countries has been the system of tenant farming, which causes the utter helplessness of the real cultivator of the soil against the nominal owner thereof; and yet we are fastening this same system here.

THE irrigation statutes of the Territory of Colorado were borrowed from the adjoining Territory of New Mexico. New Mexico received them from the old empire of Mexico. Mexico, as a Spanish province, got them from the mother country, Spain, where they had long been digested and matured by the Moorish law-givers, and the Moors by the southern borders of the Mediterranean, had long centuries before brought them from Egypt.

The Horse.

Shall We Encourage Walking Horses?

It is hardly possible to take up a journal during the Summer and Autumn, without seeing either items or extended accounts of what horses have accomplished in trotting or running. We scarcely ever see accounts of their endurance in hauling loads at a given pace, or the number of miles they have accomplished in a given number of hours at a walking gait; and yet this practice is of far more importance than their endurance at speed.

Agricultural fair managers, who might not inaptly be called "Agricultural horse-trot managers," advertise widely the large amount devoted as premiums for trotting and running, but not a word as to horses exhibiting the greatest endurance and speed at a walking gait. Why not? "Oh, it will not draw the crowd." Very well; if agricultural fairs are simply intended to draw that class of humanity whose end and aim in life is trotting and running horses, and betting thereon, well and good.

These is, however, now and then an individual who, while he admires the noble animal at speed, very well knows that this eternal pandering to mere speed is not only vitiating the taste of the public, but is also tending to breed out other valuable traits that can ill be spared.

A good walking horse should make, at that gait, an average of four miles an hour. How many can do it? Very few. Why so? The walking gait has ceased to be cultivated.

By the careful training of ambitious and active horses, they may be made to walk five miles an hour as easily as the ordinary horse now walks three. There is no reason why an average pace of four miles an hour should not be kept up with ordinary loads throughout the day. In the day's travel, this would make a gain of ten miles, and the trained would have accomplished forty miles against the thirty for the untrained one, and this just as easily to the horse of spirit as to the one with the slower gait. If the horse has not mechanical structure for this gait, of course he cannot do it. Having it, it may be brought out just as easily as a trotting or running gait; and if premiums were given for this purpose at our agricultural fairs, it would be found that individual horses would be able to make, not only five miles an hour, but some of them six. The naturally fast walker, when trained, will even do a given amount of work at the increased pace easier than at the slow pace. This we know from experience.

The energy displayed among all classes of breeders has been directed constantly to reduce and degrade the walking gait, and as a consequence, we find, each year, fewer and fewer fast walking horses. This spirit has pervaded our fair rings until now it is difficult to find a premium offered for the fastest walking horse. In looking over the premium lists received by us for 1874, embracing nearly all the Western States, we find only two premiums offered for walking horses, one by the Kansas City, Missouri, Industrial Exposition, and the other by Northeastern Iowa Agricultural Society. We are glad to be able to chronicle these two, and hope that the number may be yearly increased until the fast walking horse shall at least be regarded on a par with other road and working horses. A great error has been made in ignoring this most valuable of all the gaits of the horse. Certainly, reform is needed in this direction. —*Western Rural.*

How to Purchase a Horse.—First. Examine the eyes in the stable, then in the light; if they are in any degree defective, reject.

2. Examine the teeth to determine the age.

3. Examine the poll, or crown of the head, and the withers, or top of the shoulders, as the former is the seat of poll evil, and the latter that of fistula.

4. Examine the front feet, and if the frog has fallen, or settled down between the heels of the shoe and the heels are contracted, reject him; as he, if not already lame, is liable to become so at any moment.

Next observe the knees and ankles of the horse you desire to purchase, and if cocked, you may be sure that it is the result of the displacement of the internal organs of the foot, a consequence of neglect of the form of the foot and injudicious shoeing.

5. Examine for interfering, from the ankle to the knees, and if it proves that he cuts the knee, or the leg between the knee and the ankle, or the latter badly, reject.

"Speedy cut" of the knee and leg are most serious in their effects.

Many trotting horses, which would be of great value were it not for this single defect, are by it rendered valueless.

6. Carefully examine the hoofs for cracks, as jockeys have acquired great skill in concealing cracks in the hoofs.

If cracks are observable in any degree, reject.

Also, both look and feel for ringbones, which are callouses on the bones of the pastern near the foot; if apparent, reject.

7. Examine the hind feet for the same defects of the foot and ankle that we have named in connection with the front feet. Then proceed to the hock, which is the seat of curb and both bone and blood spavins.

The former is a bony enlargement of the posterior and lower portion of the hock-joint; the second a bony excrescence on the lower, inner, and rather anterior portion of the hock, and the latter is a soft enlargement of the synovial membrane on the inner and upper portion of the hock. They are either of them sufficient reason for rejecting.

8. See that the horse stands with the front feet well under him, and observe both the heels of the feet and shoes, to see if he "forges" or over-reaches, and it case he does, and the toes of the front feet are low, the heels high, and the heels of the front shoes a good thickness, and the toes of the hind feet are of no proper length, reject him; for if he still over-reaches with his feet in the condition described, he is incurable. If he props out both front feet, or points them alternately, reject.

9. In testing the driving qualities, take the reins while on the ground, invite the owner to get into the vehicle first, then drive yourself. Avoid the display or the use of the whip, and if he has not sufficient spirit to exhibit his best speed without it, reject. Should he drive satisfactorily without, it will then be proper to test his amiability and the extent of his training in the use of the whip.

Thoroughly test his walking qualities first, as that gait is more important in the horse of all work than great trotting speed. The value of a horse, safe for all purposes without blinds, is greatly enhanced thereby.

10. Always purchase of the breeder of the horse, if practicable; the reasons are obvious. —*Maryland Farmer.*

Mules and Horses at the South.—Whatever may be said in favor of the horse as an agricultural laborer above the mule at the North, certain it is that the position of the Arkansas correspondent of the *American Farm Journal* is well taken, favoring the mule in Southern agriculture:

Mules, on an average, are more valuable than horses, are easier raised, are not as subject to disease, are not likely to run away in wagoning and plowing, are longer lived, will do more work, and require less feed and attention; they are stronger, will draw heavier loads and stand a great deal more hardship, and are in every way preferable to the horse for general farm use. Mules come in earlier, being ready for light work when three years old. They will then do enough work on the farm to pay for their feed, and after having attained the age of four years they are ready for any kind of service. But the horse (colt) must be kept until he is four years old before he is worked at all, and when he is four he must be a first-rate colt to bring as much as the mule will at two years old. But assume the animals are both required for farm work, see what a difference there is in favor of the mule.

The working life of the mule can be as safely estimated at thirty years as that of a horse at ten years. So while a mule is working its life out, three horses will be required to do equal service.

But these are not the only items. The saving of feed is at least one-fourth, or not less than 647 bushels of corn and 327 tons of hay. These amounts added to the original saving in purchase of animals show an advantage in favor in favor of the use of the mule over the horse of over $1,000 during the ordinary life of the animal.

The mule is less dainty about food, unground grain and dry feed being just the things for him. There are still other advantages in favor of the mule too numerous to mention in a short article like this.

Bonner as a Horse-Fancier.—The New York correspondent of the Boston *Times* says Bonner ows $250,000 worth of equine property; spends five or six hours out of every twenty-four in his stables or on the road. He loves horses, thinks horses, talks horses. Nevertheless, if he wants to drive to a neighbor's house, or to a distant part of the city in the evening, he always hires a carriage from a livery stable. Dexter and the other noble steeds are altogether too fine for ordinary employment. Bonner's bill at livery is reported to be $1,500 a year, while the interest on the value of his horses at the legal rate is $17,500 per annum. He paid $25,000 for Dexter, and was pronounced profoundly foolish therefor. He could have sold him again for $50,000, although he would not take $100,000. It is one of his idiosyncracies that he never sells anything; he is only a buyer. Of all the real estate he has purchased he has never disposed of a single foot. He keeps whatever he gets, and gets more. It is said he has made up his mind to own Goldsmith Maid; and doubtless he will do so, if the mare can be got for money. Bonner can afford to be extravagant. His entire property to-day cannot be worth less than $5,000,000; and yet it is only a few years since he was a toiling printer, delighted to earn $30 per week.

Bonner did not make his money on fast horses but on the New York *Ledger*. His fancy for horses is simply an extravagance. Where one man makes anything on race-horses ten men lose, as at other gambling, and become, in a sense, demoralized in the bargain. A horse is in reality worth only what of real service there is in him.

A Gigantic Grain Elevator.—The New York Central and Hudson River Railway Company is now building at the foot of 60th street, on the Hudson River, in New York, a grain elevator, capable of holding from 1,000,000 to 1,200,000 bushels of grain. This elevator will be used principally for storage purposes for the grain brought on in the Company's cars, and intended for transferment to sea-going vessels and canal boats.

The wealthy land owner has ever the poor tenant at a disadvantage, for the financial burdens of the Government fall mostly upon the latter, and the former manipulates Legislatures and laws in his own behalf, as his light taxation proves. It may be claimed that this evil can never be in this country, since the law of entail does not obtain here, but the system, by whatever cause produced, is the same.

Boys and Girls.

Give Us a Chance.

HERE we are! don't leave us out,
Just because we're little boys!
Though we're not so bold and stout,
In the world we make a noise.
You're a year or two ahead,
But we, step by step, advance;
All the world's before you spread—
Give the little boys a chance!

Never slight us in your play,
You were once as small as we;
We'll be big, like you, some day,
Then perhaps our power you'll see.
We will meet you, when we've grown,
With a brave and fearless glance;
Don't think all this world's your own—
Give the little boys a chance!

Little hands will soon be strong
For the work that they must do;
Little lips will sing their song
When these early days are through.
So, you big boys, if we're small,
On our toes you needn't dance;
There is room enough for all—
Give the little boys a chance.

Time Waits for No Boy.

Jack and Harry had to recite their lessons to their father every day at two o'clock, but they were thoughtless boys who liked to play and idle away the time, so very often the lessons were not ready, because they had put off studying too long. Over and over again had they been reproved, until at last they thought they would really try to be diligent and punctual. For almost a week they did pretty well, but then there came a day when the sun was so bright and warm and the air so soft that it seemed as if nothing in the world could draw them away from under the old apple tree, where they lay in the tall grass on their backs, looking up at the cool green leaves and the peeps of blue sky. There they lay and talked of all that they meant to do, and the things they wished they had, and the places they wanted to visit.

"Uncle Henry is going to send for us some day very soon," said Harry, "to go with him out to Mr. Cheesebro's farm, to stay all night and the next day. Won't it be splendid? I shall carry my fishing rod, for there are trout in the brook, and I *may* carry Ben's gun and hunt hares."

"Yes, and what good things we shall have to eat," said Jack. "There'll be mince pies and doughnuts, and roost goose and pickles, and plum pudding. Do you remember, the other time we went, how Mr. Cheesebro gave us great slices of cake between meals and filled our pockets with nuts?"

"Guess I do!" answered Harry. "I have been wanting to go again ever since. Sammy Cheesebro said next time we came he'd have a party and play old-fashioned games. Won't it be fun? I wonder what day uncle Henry is going."

"He said pretty soon," said Jack, hopefully. "Say, Harry, you know that big swing they've got out in the barn, and the high hay mows! Oh, what fun we shall have! I wish we were there now, and then we shouldn't have that awful arithmetic lesson to learn."

"That awful geography lesson, you'd better say," replied Harry. "I took a look at it before I came out here, and it's dreadful. We have to bound every country in Asia. Can you do it?"

"No, but it won't take long to learn. Say, Harry, see that fish hawk away up in the sky. wish I had a bow and arrow.

"Ho! I don't. I wish I had a rifle." said Harry, shaping his eyes to look up.

And so they planned, and dreamed, and talked, lying luxuriously in the tall nodding grass, with birds to sing over them and flowers to sweeten the air. If they had only learned their lessons first! But time flew, the hours sped by, and when at last they reluctantly arose and went into the house after their books, behold, it was one o'clock, and there was lunch waiting for them!

They stared at each other in dismay, and then, being very hungry, they began to eat their sandwiches and gingerbread, and talked over the situation between the mouthfuls.

"We never can learn it all, never!" exclaimed Harry. "There are two endless sums in practical payments to work out, and then all those countries! If we had two hours, even!"

"Tell you what," said Jack, let's set the clock back an hour! He always looks at the clock before he calls us, and he won't think nor find out about it."

Harry whistled, thought it over, and made up his mind.

"All right," he said. "We'll do it. Your's awfully sharp, Jack. Here, pull that big chair around, so I can stand in it and reach up to the hands."

It took but an instant, the clock ticked on as tranquilly as before, but now the hands pointed to twelve instead of one, and the boys had the two hours they wanted for their studies.

Away they hurried to their books, and while the quickest one worked out the long sums, the other delved at boundaries. It was hard work, but they kept at it as if they were running a race. Half an hour after their father came up the avenue, walking very fast, and almost out of breath.

"Bless me!" he said, as he looked at the clock. I thought it was a great deal later than this! So much for getting one's lunch away from home. Brown must have his as early as eleven o'clock. Well, I'm glad it's no later. I shall have time to write two or three letters before I call the boys."

And he shut himself into his library among his papers. There was quiet in the house for an hour longer, during which time the boys applied themselves almost breathlessly to their tasks. The arithmetic exercise was ready, and the boundaries were almost learned, only it seemed as if Jack never could get Siam and Anam right.

At half-past one by the clock their father came out of the library.

"Come, boys," he called loudly. "No lessons to-day! Hurry on your jackets and hats; uncle Henry wants you to go out to Mr. Cheesebro's with him, and I'm going to drive you over to the train."

How the boys sprang up and shouted, and dashed away their books. They were all ready by the time the horse was at the door. Harry had not forgotten his fishing rod, and Jack wore his trousers that had the deepest pockets. Their mother stood on the steps to see them off.

"Hurry along!" called their father from the carriage. "We've none too much time. The train starts at ten minutes past two, precisely!"

"Oh! why!" faltered Jack, and Harry stopped short, looking dumbfounded.

"What's the matter?" cried their father.

"Hurry, I tell you! We've no time whatever to lose."

"The clock is too slow!" said Harry, despairingly.

"Slow! no, it isn't. I set it by railroad time myself this morning. What do you mean?"

"We put it back a whole hour," the boys confessed, mournfully.

"What on earth did you put it back for?" exclaimed their father.

"So we could have time to learn our lessons."

Their mother looked grave and pitying. Their father jumped out of the carriage, and called the hired man to take the horse back to the barn.

"Well, my lads," he said, "come into the house, and I'll hear you recite your lessons. You've lost your chance of going out to Mr. Cheesebro's, and I think you have pretty thoroughly learned another lesson besides your geography and arithmetic. Come in."

Any young miss would rather have her corsets tight than her "feller."

Educational.

To Young Men.

WHAT are you living for? What is your aim, and what do you intend to do in this world? Have you no object, no aim, no notions of your own? We are living in an age of progression, and each is expected to act his part. A part which will be of use to the world, an honor to themselves, and a glory to our nation. Each is expected to make an effort, an effort for the good of all. Good aspirations lead on to ever increasing efforts, and indicate the grandeur of our destiny. We must have high and noble aims, and then strive to reach them. Success is sure to follow earnest, unceasing toil. It may take long years of labor, but still press on. You will be all the better for your striving. Life is a race, and many are on the course. You must either run or be trodden under foot. The multitude is moving on, you must not look behind, or defeat is certain. Young men, have an object in view, and then press on to gain the prize. "You can if you will." Will you? What if you should fail once or twice? Men are scarce that have never failed in their undertaking. You must not expect to succeed better than others. Nothing valuable is obtainable without labor. Your success will depend upon your strict adherence to your business. "As a first principle, let every transaction be of that pure and honest character that you would not be ashamed to have appear before the whole world as clearly as to yourself. It is of the highest consequence that you should not only cultivate correct principles, but that you should place your standard so high as to require great vigilance in living up to it."

The above is a quotation from Lawrence. Every young man should adopt it as a rule by which to govern his life. And to you that may read this, I would say, form a purpose of your own. Try to be something. There is a place for you, all you have to do is to find it. Aim high and you will hit something above your level. Reader, have a noble object in view, and then with all your might press forward until you reach it, and it is yours.

J. H. Funk.

Danville, Iowa, Oct. 15, 1874.

Education of Girls.—There are elements at work at both ends of the system of female education, that are destined to achieve great results for women. One is the school of Natural History at Pennikese Island, at which more than half the pupils are female teachers, and the other is the establishment and gradual spread of *kindergarten* schools for the nurselings. Undoubtedly the opening of colleges to women and the co-education of the sexes is another element not less potent in its effects. The aptitude of women for patient investigations, for mathematical calculations in which time and accuracy rather than boldness and originality enter, her delicate touch, her quick perception—all these eminently fit her for excellence in various departments of natural and mathematical science. Education and training is all she needs to open wide to her many fields of useful labor hitherto occupied almost entirely by men.

So long as boys and girls, men and women live in the same family, we must believe in co-education within certain limits. The basis of friendship is sympathy, and the greater the sources whence that sympathy flows, the stronger and more enduring will be the friendship. Love is friendship sublimated—we do not refer to that passion of quick growth and decline which springs from physical contrasts of temperment, but that which has its seat in reason is judicious, and by consequence grows mightier and more absorbing as youth departs and autumnal ripeness clothes the intellect and the heart with those qualities that command honor and veneration. So we would have the boys and girls study substantially

the same text books, varying them according to their natural aptitudes, both alike being held to a high standard of scholarship. Thus will girls be fitted for marriage to intelligent men, with whom they may realize all those delights and advantages which spring from the purest friendship and the warmest love. Thus may they be qualified to be the mothers and teachers of a race of superior men and women. Thus may they enjoy, as they pass through life, the infinite provisions everywhere around them for culture and for happiness.

The lives of many women in so-called easy circumstances are perfectly pitiful. Lacking early and liberal culture, they are easily fettered by the dull routine of household and nursery duties, from which it is almost impossible that they should lift themselves, or be lifted by their husband or anybody else. Had they once swept on free and easy wing through the heaven of high literature of art or of science, a new book, fine picture, a fresh discovery, would be as an open door from their cage, through which for a brief space they could fly to the upper realms of thought and enjoyment, and leave dull care behind. With what freshness and spirit would they return to their duty again!

It is true that certain plants flourish best in certain soils, but in compounding the soil of our flower beds, we take it for granted that though a dozen different varieties of seed are planted in the same bed, each will appropriate to itself only those elements suited to its growth. Our care is that what each needs shall not be wanting, and we trust to the instinct of the plant to reject that which is hurtful.

In like manner we would have our daughters possess every advantage for the most varied and liberal culture, trusting that healthful and normal natures will appropriate those elements suited to their various idiosyncracies and reject everything that ministers to irregular and abnormal growth.—*The Science of Health.*

Farmers cannot occupy a little spare time better, or more profitably, than in reviewing their operations during the last year. Every year has its lessons, and experience is the best of instructors for those who have ears to hear. It is true that the interferences of a Higher Power are more perceptibly felt and have more immediate effects in the profession of the farmer than in any other. Rain and drouth, cold and heat, insects and blight, storm and sunshine, bring with them their blessings and their calamities; and these come alike on all. The farmer cannot feel responsible for a "bad year." But he can look back and see where he has failed, either in the exercise of his industry or his judgment, and lay a lessor for the year upon which he has just entered, and this retrospect with a view to correct errors in the future is a characteristic of all successful farmers.

A Royal Marriage.—When two young people start out in life together with nothing but a determination to succeed, avoiding the invasion of each other's idiosyncrasies, not carrying the candle near the gunpowder, but sympathetic with each other's employment, willing to live on small means till they get large facilities, paying as they go, taking life here as a discipline, with four eyes watching its pearls, and four hands fighting its battles —whatever others may say or do, that is a royal marriage. It is so set down in the heavenly archives, and the orange blossoms shall wither on neither side the grave.

Parasites.—It is common to note that each species of animal has its own parasites, which can exist only upon creatures which have more or less kinship with their host. Thus the *oscaris mystax*, which torments the domestic cat, is found in all species of *felis*, while the fox, so closely resembling the wolf or the dog, is never troubled with the *tænia serata*, common in the last mentioned animal.

Correspondence.

NOTES OF TRAVEL.

BY MRS. C. F. YOUNG, M. D.

THIS sixteenth day of November, in Contra Costa county, the hills are delicately tinged with the green of Spring grasses. The summer-fallowed ground contrasts finely with tints of color that are at this hour reflected on the clouds—not in pink, or blue, or amber, but a combination of all, by degrees softly shading down to the sky line of a rosy sunset, and purple mists suggestive of tropical lands not far away. Indeed, within ten miles, to-day, one can find the

ORANGE, LEMON AND BANANNA

growing in the open air. A profusion of flowers that, east of the Rocky Mountains, would be found only in the conservatories of the wealthy, or the hot-houses of professional gardeners, bud and bloom on the porches and by the garden walks of this workingman's home, receiving only the modicum of care given by children and a feeble woman. Meadow larks have filled the whole day, since earliest dawn, with music. A pair of them are now gathering supper under a rose tree within twenty feet of our open window.

Yesterday we passed over thirty miles of country roads. We saw many fields of early sown summer-fallowed and volunteer wheat evenly seeded and growing finely. People were sowing grain, others looking after the squirrels, many others rushing ahead with the plowing—gang plows, two, four, and six-horse. Query: Why cannot women and girls manage gang plows, and put in grain, thus learning how to enter into the care and daily hopes of the farmer, as well as the profits of the crop? One of the prettiest fields of oats we have ever seen was put in by a fourteen-year-old girl—plowing, seeding, reaping, and taking care of the team also. A sulky plow and improved machinery, and hearty encouragement, were hers. She could make bread and sew nicely; sing and play sacred music. Did it hurt her to know how to manage a crop or have an interest in the details of farm work?

THE CONTRAST.

We have seen this week a father at work in the mines while one hundred and sixty acres of hill and interval lands and two acres of orchard were neglected. The daughter, in this case, is in the city seeking work; her husband, intemperate; her mother, pining over "the might have beens" and hoping the "Lord will next time give her daughter a good husband." Chickens were in the house; old rags about the door-step; the hay not stacked or sheltered. Depend upon it, the self-respecting, tired, ambitious women are best help-meets and housekeepers.

Walking through the garden we asked, "Can you not prune these young trees?"

"No," they scornfully replied; "we think women's work is in the house. We are not the strong-minded kind!"

Verily not, and no prospect of any strength of character being imparted to the children born in the house.

The cows were yet in the coral, hungry and thin. "We only strip them a little for the children. It's cheaper to buy than to make butter."

We thought we could see how milk and butter and fruit, with a wind-mill to lift water to irrigate one acre of garden, might be made to yield a good living, and how, little by little, acres of nut-bearing trees might grow to productiveness and beauty. Oranges and lemons were possible—as possible on the sheltered side of the Diablo hills as in any part of the State, and even one tree would add very much to the beauty of the home life.

"Did you dry any fruit?" we asked, "or can any?"

"Oh, no. It don't pay to do such drudgery when we can buy it so cheap."

This is the rock upon which so many California people break up. "Many a little makes a mickle," say the Scotch people. It's equally true that dimes make dollars. A pound of apples dried nicely for winter use saves twelve and a half cents at least, besides the time and shoe leather required to go after them. The home-made article can be free from cores and skins: the store article may have both. Bowls of grape jam—made with only one pound of sugar to the pound—might have been prepared (fifty for every family of four), delicious and healthful, from fruit that to-day is rotting on the vines. The fact is, dear reader,

IT DOES NOT PAY

to buy anything that you can make or save at home in time and materials that otherwise would be wasted.

Then, there are whole reefs of rocks on which to be shipwreck in the trifling story papers—"given away if you will buy the flashy cheap chromos." Morning, noon and night some one may be seen reading the exciting continued tales of impossible heroes and heroines. Wherever this habit is formed, and becomes a passion, plows and harrows are rusting, chickens roosting over the harness, the stock is neglected, fences down, weeds abounding, trees and vines scragly from neglect, and the house, inside and ont, in a worse condition. These people are dyspeptics in brain as well as stomachs. Exciting food and unnatural stories please best. They do not relish simple bread and baked apples, nor pleasant and instructive farm journals. Infinitely better for all parties to rise early and work late; to scrub floors, and pull weeds, and by hand, pare apples to dry. Better even to walk five miles with a basket of eggs to sell, than to fret and whine and dawdle over a sickly story or a flashing fashion plate. The first brings self-respect and propriety: the last, discontent and ruin.

The Scotch and Welsh people, who commence very small, working by the day, in a few years, have snug and thrifty homes. Our countrymen and women, in too many instances, by their dislike of plain work, and their foolish desire to be fashionable, sink away from broad, fertile acres and the possibilities of beautiful homes, and then blame capital and Providence.

To help correct this false pride, let each reader of the Agriculturist try to persuade one other person to subscribe for and read a copy each month of the glad new year. Edited by a workingman, who, with his wife, has solved the problem of making home attractive and beautiful with only the materials within the reach of the humblest toiler, certainly, in the coming year, many lessons can be given to assist those who wish to learn and are willing to try to improve their homes and their hearts.

When a man owns the land upon which the labor of his life is expended, and which he expects to leave as a legacy to his children, his interest in the political affairs of the nation must be vastly greater than when no sense of responsibility exists, and when a system which tends to weaken the citizen's interest in the affairs of state threatens, it is time to meet it with determined resistance.

Bashfulness is often like the plaiting on spoons—when it wears off it shows the brass.

Cleaning a Field From Thistles With Sheep.

Mr. Hawkins and Mr. Broughton, of Solano county, live near together. They each have a hundred acre field adjoining. The soil is alike. Year after year these fields have been sown in wheat until the average crop was not more than fifteen or twenty bushels to the acre; beside this the little thistle, or nettle as some call it, had almost taken possession of them. During the month of February last year, Mr. Hawkins put 600 sheep on his and let them remain until August. In the meantime they ate up every particle of vegetation and trampled the whole field into a perfect dust bed. Yet when they were taken off they were perfectly fat. Last winter it was put in wheat, and when harvested produced fifty-eight bushels to the acre, the whole being perfectly free from thistles, while Mr. Broughton got only fifteen from his, and any amount of thistles. May not farmers learn a lesson from this? This land did not lie profitless as fallow ground does, but the sheep were a source of revenue. While they enriched the soil they cleared it of weeds and prepared it for a more abundant yield.—*Sonoma Democrat.*

A Model Republic.

The little Republic of Switzerland, perched among the Alps, is the pattern Republic of the world. Its population consists of 2,400,000 souls, and there are 485,000 households of families. Of the heads of these families 405,000 possess landed property, so that the whole of the real estate of the Republic may be said to be distributed among the whole of its people. The exports of the country amount to $58,000,000, and the rate of pauperism is the lowest in Europe. Taxes are nominal, officers' salaries low, defalcation and civic corruption are unknown, and the offices (local and federal) go a begging. Such are a few of the effects of the extensive diffusion of property, and nearly equal pay for service public and private.

Advancing and Retreating Races.

As the wild man retreats, so the wolf who shared the forest with him is forced to yield to the prowess of the dog, that companion of the second; while the lordly bison is compelled, year by year, though the requisite "nine points of law" be on his side, to relinquish his rich prairie haunts to the more sturdy ox. The wild hog, too, that most intrepid and tenacious of brutes, disappears in some unaccountable way from his favorite resort of field and forest, where the domestic hog roots and riots in his stead in ever-increasing numbers. Wherever these two opposing forces meet there seems to be but one inevitable result—the lower type must conform to, and be blended with the higher, or be exterminated.—*Phrenological Journal.*

Testing Seeds.—In a portion of Denmark, where one-fifth of the land is cultivated to clover, the vitality of the seed is tested by placing a quantity of the seed on a knife blade, and heating it over a lighted candle. The good seed will pop open and pop off, while the worthless remains and carbonizes on the blade. Mr. Christian Baggs, of Oakland, reminds us of this fact in response to an inquiry for practical tests for seeds.—*Rural Press.*

Sorrows are shadows of past joys.
A near lantern is better than a distant star.

SAN JOSE INSTITUTE AND BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

The next session commences the first Monday in January, 1875.

The Faculty consists of a corps of eight Teachers, secured with reference to their particular qualifications and fitness for their respective positions.

The Modern Languages, Drawing and Painting are taught by highly accomplished and experienced Teachers.

The Institute is divided into Primary, Intermediate, Grammar and Academic Departments, which are in a flourishing condition, under the tuition of first-class Teachers. These departments are under the supervision of Mr. Isaac Kinley, a teacher of long and successful experience.

The Business College Department, under the Principalship of James Vinsonhaler, occupies a new, commodious and elegantly furnished room. It is complete in all its appointments, and in thoroughness and efficiency ranks with the best Business Colleges in the State.

Boarding Department.—The rooms are pleasant and neatly furnished. Boarders are required to furnish their own toilet. References will be required from those who are unknown to the Principal. This department is under the supervision of Mrs. A. M. Gates.

Sessions.—The year is divided into two sessions of twenty weeks each, and the Sessions into two Quarters of ten weeks each.

EXPENSES PER QUARTER OF TEN WEEKS.

Board, washing, light and room	$70 00
Primary Department	9 00
Intermediate Department	10 00
Grammar Department	12 00
Academic Department	15 00
Business College Department	25 00
German (3 lessons per week)	8 00
French or Spanish (extra)	8 00
Piano Music	15 00
Piano Music, with use of piano	20 00
Drawing (3 lessons per week)	8 00

Oil Painting, Water Colors, etc., charges according to the time given.

Any Student entering the Business College Department may have the privilege of entering the Institute Department without extra charge.

Advantages.—None but experienced and competent teachers employed. This Institution is free from sectarian bias, and combines the very desirable advantage of a thorough Academic and Business education.

Scholars attending from a distance have the advantage of boarding in the Institution, and of having reasonable care exercised over their department and progress. They are also free from the temptations and vices to which the young are subjected in larger cities.

All business correspondence should be addressed to
JAMES VINSONHALER,
San Jose, Cal.

Hearth and Home.

1875. LADIES WANTED As Agents.

THE NATIONAL TEMPERANCE ALMANAC

And Teetotalers' Year Book, for 1875,

Contains 72 pages of Statistics of Temperance, Anecdotes, Stories, Puzzles, Choice Illustrations, Postoffice Address of Officers of State and National Bodies, a full Directory of all Temperance Organizations in New York city and Brooklyn, all Temperance Publications and Papers, etc., etc. Sent by mail on receipt of price, Ten cents, single copies; $1 per dozen; $7 per hundred.

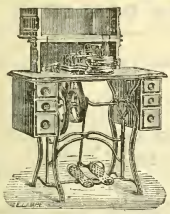
Address, J. N. STEARNS, Publishing Ag't, 58 Reade Street, New York.

MY ANNUAL CATALOGUE OF VEGETABLE and Flower Seeds, for 1875, will be ready by January 1st for all who apply. Customers of last season need not write for it. In it will be found several valuable varieties of new vegetables introduced for the first time this season, having made new vegetables a specialty for many years. Growing OVER A HUNDRED AND FIFTY VARIETIES on my several farms, I would particularly invite the patronage of market gardeners and all others who are especially desirous to have their seed pure and fresh, and OF THE VERY BEST STRAIN. All seeds sent out from my establishment are covered by three warrants as given in my catalogue.

JAMES J. H. GREGORY,
Marblehead, Mass.

THE NEW IMPROVED

FLORENCE



Agency Established on the Pacific Coast in 1863.

Side Feed and Back Feed.

FARM FOR SALE.

Within Six Miles of Reno, Nevada.

A Most Desirable Farm of 160 Acres.

TITLE—U. S. PATENT.

THIS FINE FARM IS SITUATED at the slope of the mountains southwest from Reno, and is surrounded with an excellent free Stock-Range. Upon it is one of the best fruit orchards in Nevada. Over 500 bearing trees of choicest varieties. Also a large lot of small fruits. Alfalfa, Timothy and Grain do finely. Connected with the Farm is a 40-acre lot of Timber, containing some 2,000 cords of Wood. Also, a Fish Pond. The place is pleasantly situated near a good market. The soil is first-rate, and the location and climate healthy. It offers special advantages for a good home to an enterprising man with a family.

Vol. 6. San Jose, Cal., April, 1875. No. 4.

A FINE HERD OF SHORT-HORNS.

Everybody who visits San Jose should take a ride to Alum Rock Springs, over the grand new drive from San Jose to that point. And they should bear in mind that at the Avenue Ranch is one of the finest herds of Short-horns on this Coast, the property of Cyrus Jones & Co., breeders and importers. The drive, which leads around hills that overlook the valley into a deep canon, wild with stream, forest and rocky declivities, where is a warm spring and other attractions, is becoming noted by all tourists. After rising to the top of the grade, a branch road leads to the right, to Buena Vesta Point, a grand outlook over the valley, donated to the public by the proprietors of Avenue Ranch. The road continues to the stock yards and residences of the proprietors.

Mr. Cyrus Jones, who has principal charge of the fine stock department, is a breeder long known in Illinois and Kentucky and noted for his success. What brought him to this State was partial failure of health in the inclement climate of his native home. But he came here to make California his home, and has chosen a locality at once healthy and adapted to the business.

Gen. Giles A. Smith, whose fine residence commands a magnifilent view of our valley, is a partner upon the same farm, as was Mr. F. H. Hicks, lately deceaseed.

These gentlemen came here about two years ago with their stock, and an acquisition it was to California when they came. Our farmers have been so slow in arriving to an appreciation of such stock, that, to less confident and persevering men, the results, so far as sales are concerned, would have been somewhat discouraging. But the people here, as well as in the East, are fast awakening to the advantage of breeding the best stock.

This herd is fast increasing in numbers and value. Only one thing has been really discouraging, and that was a disease common in California, and apparently peculiar to this State, that attacked this herd last Fall. It is common here among herds that are in good condition—seldom attacking animals poor in flesh. It may be properly called the "Yellow Disease," as the first symptoms are, excrement hard and yellow, and afterwards the skin all over the animal gets as yellow as saffron. The bowels are constipated, the appetite fails, and the animal eats earth till its bowels are completely clogged with it. The disease has been considered incurable, but although every animal in this herd was attacked only four died, but these were very valuable stock and the loss is severe enough. At the time of our visit most of the others were well and all were considered safely over the complaint. The animals that died were examined. The spleen showed a mass of corruption when cut into, the kidneys were badly affected, and the bowels were plugged up with the earth the animals had eaten. The gall was enlarged, and the liver affected. When the disease appeared, the animals had been eating nothing but dry feed for some time, and had had the run of a stubble field, with plenty of good water, air and exercise. The successful treatment consisted in opening the bowels with physic, giving clysters to aid evacuation, and assisting each organ to do its proper work in freeing the bowels and blood of impurities. The animals are now in good order, and show little ill effects from the sickness.

The two breeding bulls of this herd are of superior blood. Master Maynard, three years old, of fine form and pedigree, Duchess predominating, is a model of symmetry. We lost the notes we took the day we visited the herd, and cannot give particulars as to names and pedigrees, but Mr. Jones has them all at his tongue's end, as familiarly as possible. The two year old bull is also very fine; indeed, these two bulls were selected East last Fall by Mr. Jones, and are of the best blood extant. Among his fine cows are two that it is hard to choose between for perfect beauty. They cost Mr. Jones $1,600 each. One of them has a red bull calf which Mr. Jones values at $1,000—*no less*—and he is worth the money. A finer lot of young calves were never seen on this Coast. The most of them are bull calves—unfortunately, Mr. Jones thinks, for him, but we tell him *fortunately* for this State, as our stock men need hundreds of such to breed to their herds. We expect Jones & Co. will publish the pedigrees of this herd soon.

It will pay any stock man to visit Avenue Ranch, talk with the proprietors, and judge of the merits of the animals for himself.

"FAIR" TACTICS.

The feeling among the mass of the farmers in this valley against pool-selling-horse-racing at our fairs is growing so strong that the jockey members of the Santa Clara Valley Agricultural Society feel put upon their mettle to use every means to *protect* their horse-gambling interests.

A great majority of the life members seem to be horse jockey men, who have been called in more to manage races than to advance the industrial interests of the community. To draw the lines still closer, and discourage persons who are interested in elevating the industrial above the sporting interest from joining the Society, the members raised life memberships from $25 to $50.

The annual meetings for electing officers and doing other business are held in January. Annual members, to be able to vote, must get their tickets at or before that meeting. A disposition was beginning to be shown by several farmers and others to get annual memberships, costing $5, so as to attend the meetings and take part in the business of the Society, instead of waiting until the Fall fair to get annual membership tickets after the business arrangement for the season had all been made. Now, in order to still further defeat the disposition of the workingmen, who have always represented the industrial features of the fair, the jockeys have erected a fortification of defense by allowing *none but life members to vote* at their business meetings.

One of the active annual members, Mr. A. C. Erkson, tells how this last move was made:

At an adjourned meeting of the Society, in the latter part of January last, the Committee on Constitution and By-Laws, consisting of Cary Peebles, Coleman Younger and Oliver Cottle, reported among other things that none but life members be hereafter allowed to vote at the meetings of the Society, thus ruling out all the annual members.

There were just fourteen members present when this report was made. When the question came up on the adoption of this amendment to the Constitution, Mr. A. C. Erkson, an annual member, opposed it; setting forth, among other reasons, that it would disfranchise a great majority of the members who now contributed to the support of the Society. Almost all the funds received now by the Society come from annual members, and it would be manifestly unjust to deprive them of their vested rights to share in its management.

Mr. Peebles and Mr. Younger urged the necessity of such a change in Constitution principally for the reason that it would be very easy for some designing person or persons to procure the memberships of enough other persons to out-vote the life members, who have hitherto had the principal control of the institution, and to alienate or sell its real estate or to squander its funds in building a pavilion, or in some way to injure or destroy its usefulness.

In reply to that argument Mr. Erkson remarked that such statements and insinuations were anything but complimentary to the great mass of working farmers in this county, as well as to the mechanics who have contributed of their money and time and trouble in making the exhibitions the success they have been, and such aspersions on their honesty and good faith would be resented by them. Mr. E. remarked that he had contributed some $75 in the payment of annual dues, which was at least three times more than any one present had contributed; that he had served on committees of various kinds, and had the interests of the Society as much at heart as any life member could have, and he believed he expressed the sentiments of four-fifths of the annual members when he said that if you pass this vote disfranchising them you have struck a blow which will be fatal to the future welfare of the Society.

Mr. O'Donnell, Mr. Ryland, Mr. Jones, Mr. Cottle and one or two others spoke on the question; every one of them being in favor of excluding annual members. The question was then put and carried, every one voting for the change except myself. I then bowed myself out, saying that I could be of no further use to them—Mr. Ryland kindly remarking that "although no longer a voter, they would be very glad of my counsel and any other assistance I could render."

The idea that there would be a disposition on the part of annual members to squander the means of the Society, must have been advanced to blind honestly inclined members to the real objects of the jockeys. The only interest that any annual member who is opposed to making horse-racing a leading interest has shown, is to correct some of the abuses that already exist, and advance the Society and the people. But if any one has $5 to pay for a membership he can still have the honor of being one. If he cannot vote, he can "render assistance" and give aid and comfort to the cause.

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

The annual meeting of the California Thoroughbred Cattle Breeders' Association will be held at the Grand Hotel, at San Francisco, on Tuesday, April 6th, at 2 p. m. The annual election of officers will take place, and other important business will be transacted.

The idea prevalent amongst many farmers that the gopher will not eat the roots of the eucalyptus, pepper tree and castor oil plant is erroneous. We have seen these plants destroyed by gophers, who seem to grow as fat on such food as on the most succulent vegetable. Strychnine and phosphorus are the proper condiments "to stay the stomach" of these rodents.

Quantity of Vegetables to Feed an Animal Daily. — Several persons have thought that we placed the estimate too high —24,000 pounds of vegetables to a steer in four months' feeding, or 200 pounds per day. But Mr. Story says they will eat that much. When we remember that there is only about 8 per cent. of nutriment in a beet, or about 16 pounds in 200, it will not seem very preposterous. And they will eat just about as much hay with the beets as they would without them. It is natural for animals of the bovine species to keep the stomach distended when feed is plenty. They can digest their food best when the ponch is full, and they cannot keep healthy without full stomachs. An animal that eats all the vegetables, roots or squashes, that he wants will not care to drink much water. But to take on fat quickly they must eat all they want of rich food without exertion, and be kept quiet and resting as much as possible.

A subscriber in Missouri asks whether a person can enter a piece of land under the homestead law in California. Yes, if the person can find a piece of Government land. There is some Government land worth having in out-of-the-way places, but nearly all of the desirable land is monopolized by grants and grabbers. Probably no State in the Union has been so cursed with land pirates as California has. In some parts of the State a man who attempts to pre-empt land does so at the peril of his life. Stock men overrun much desirable land open to pre-emption, and it seems that the rights of individuals are as little respected as when there was no law but revolvers and bowie knives.

The grape is the only plant we now think of that will be benefitted by allowing the moisture in the surface soil to escape or be taken up by other plants. And especialy when growing in rich, moist soil is this the case. We have known good crops of grapes to grow and be sweet and fine on soil that had been allowed to overrun with weeds, while just over a fence, where the soil was carefully cultivated, the grapes were mildewed, sour and almost worthless from excess of richness and moisture in the soil. We have watched this thing for the last five years, and feel assured that it is policy on moist soils to absorb the moisture by cultivating some succulent crop, or allowing grass to grow between the rows of grape vines.

Good Butter Cows.—The best proof that it pays to get good cows and then feed them plentifully of good grass and hay is given by the experience of Mr. F. T. Holland, who resides in the Evergreen district, east of San Jose. He has four fine cows, three of them high grade Aldernies and one a first-rate American cow. In the Fall and Winter he feeds roots and squashes with hay, and always gives hay night and morning when grass is ever so good, and he always has a lot of green grain and corn growing to furnish green feed when the grass in his pasture 'gets dry. Good stock and good feeding is his motto. From the four cows he has been making fifty pounds of butter a week during the flush of grass feed. This is probably not excelled by any four cows in this State. Mr. Holland has a forty acre farm which he takes pride in tilling according to correct practice, and he attributes his success with his cows as much to good feed as to fine stock.

The Present Dark Age of Inquisition. We sometimes hear persons speak of the Dark Ages and the age of the Inquisition as something that is past. But some events of the present day don't look much as though we had advanced very far ahead of "ye old times." For instance, the incarcerating of Philosopher Pickett in the jail at San Francisco, and keeping him there in defiance of the just sense of the community without trial, and for no greater offense than disputing the right of a judge to hold his seat longer than the time he was elected and honorably entitled to hold it, under the ruling of the same court that a *contempt* had been committed. For months poor Pickett has been suffering the abuse of unjust confinement in this boasted free government. The judges who keep him there should be arraigned for contempt of law and justice and ever sense of honor and humanity. At any rate, if all who have a supreme contempt for a Supreme Court that will assert its supremacy over a poor old man, who never meant harm to any good man or motive, by imprisoning him in this absnive manner could be imprisoned, there would be but few decent people left to tell the tale. Such justice ought to be mobbed if there is no other law to reach the case; and if there is, then the whole community who witness the outrage are equally guilty with the contemptible judges who inflict and permit such an outrage upon humanity.

Orange Culture. — From the time we started this journal, we have insisted that it is not necessary to go to Lower California to start an orange orchard, for the fruit can be produced in all the foot-hills about the great interior valleys, and in the valleys themselves, below the snow line. Every year is convincing more people of the truth of our assertion. For several years fine oranges have been grown in Stockton, Sacramento, Marysville, Oroville, Bidwell's Bar, Grass Valley, and many other places in the upper country—oranges that, in size, beauty and flavor, are not surpassed by any grown in the south. One of the most remarkable trees is at Bidwell's Bar, Butte county, near the snow line. It is now about twenty years old, is about a foot in diameter of trunk, spreads twenty feet, and is some 30 feet high. There is said to be upon it now seven hundred oranges. We saw this tree fifteen years ago; also trees at Marysville that are now doing finely. This season there has been a better demand for orange trees in this part of the State than ever before, and the demand will increase from year to year until every home orchard will contain orange as well as apple trees.

SENDING PAPERS EAST.

Quite a number of our subscribers, after reading the AGRICULTURIST, send it East to their friends. We often hear from them. Following is a word such a subscriber sends us in way of encouragement:

EDS. AGRICULTURIST: A word of encouragement may not harm you from away down in the Old Bay State:

"The papers you send us are read and re-read, then loaned, and then sent to distant friends. T— thinks he can't see to read our home paper, but he can see to read yours through and through, particularly 'that AGRICULTURIST,' which he often speaks of as giving him the greatest interest." (T— is an old California pioneer.)

"I am sure you nor sny one else ought to be sick in California. Oh, we have had *such a Winter*, and now the walking is horrible. The snow is till very deep (March 15th), but no sleighing, for it is slop, slop. Some streets seem like rivers. But when we do have a pleasant day, it seems so bright that we can look forward to a 'coming Spring.'"

Yours, "CUSH."

We will assert, right here that there is no paper in the State that uses clearer new type, or is more carefully printed than the AGRICULTURIST. We take a pride in sending out a neat paper, stitched and trimmed, and ready to read like a book, without tearing or cutting of leaves. We spare no pains to make it acceptable to everybody, and of such a character that it will always be welcomed into every family.

Poetry.

"Only a Farmer's Daughter."

HE'S only a farmer's daughter,"
A stylish lady said,
With a scornful glance of her handsome eye
And a toss of her haughty head.

She was frilled and flounced and furbelowed
In the very latest style;
Her head was a wonder of crimps and curls,
And her train something less than a mile,

Her hands, that sparkled with many a ring,
Were shapely and fair to view;
As they well might be, for no useful work
Were they ever allowed to do.

To hear her talk of the "lower class,"
Of their sins against propriety,
Of "her family," and of "country girls,"
And her horror of "mixed society,"

One would think that among her ancestry
She numbered at least an Earl.
(Her father was quite a carpenter,
And her mother a factory girl.)

They say she is brilliant and beautiful;
I will not their words deny;
But ah! the farmer's daughter
Is fairer, by far, to my eye.

She is not in the height of fashion,
But is very becomingly dressed,
With flounces enough for comfort,
And they look as if made of the best.

Mirth and innocent happiness
Out of her blue eyes shine;
Her hair is untortured by crimps and curls,
And she wears it by right divine,

No mother toils in the kitchen for her,
While she on the sofa lolls,
Novel in hand, dressed in her best,
Receiving her morning calls.

A share in the heat and burden of life
She willingly, cheerfully takes,
And duty and love, in that happy home,
A pleasure of labor makes.

And though you may smile at this curious fact,
I have seen her with hoe in her hand,
While she planted the corn, or waged war on the weeds,
When man's help was scarce in the land.

And her flowers—well, next summer you'll see them yourself,
As you ride past the farm on the prairie,
And mark the home, covered with roses and vines,
The work of this Martha or Mary.

And I'm sure you will say, spite the verdict of those
Who live out in fashion's gay whirl,
That "only a farmer's daughter" means
Only a sensible girl!

Under the Daisies.

It is strange what a great deal of trouble we take,
What sacrifice most of us willingly make,
How the lips will smile though the heart may ache,
And we bend to the ways of the world, for the sake
Of its poor and scanty praises.
And time run on with such pitiless flow,
That our lives are wasted before we know
What work to finish before we go
To our long rest under the daisies.

And too often we fall in a useless fight,
For wrong is so much in the place of right,
And the end is so far beyond our sight,
'Tis as when one starts on a chase by night,
An unknown shade pursuing.
Even so do we see, when our race is run,
That of all we have striven for, little is won,
And of all the work our strength has done,
How little was worth the doing.

So most of us travel with very poor speed,
Failing in thought where we conquer in deed,
Least brave in the hour of greatest need,
And making a riddle that few may read
Of our life's intricate maze.
Such a labyrinth of right and wrong,
Is it strange that a heart once brave and strong
Should falter at last and most earnestly long
For a calm sleep under the daisies.

But if one poor troubled heart can say,
"His kindness softened my life's rough way,"
And the tears fall over our lifeless clay,
We shall stand up in memory in brighter array
Than if all earth rang with our praises.
For the good we have done shall never fade,
Though the work be wrought and the wages paid,
And the wearied frame of the laborer laid
All peacefully under the daisies.

What is His Creed?

He left a load of anthracite
In front of a poor woman's door,
When the deep snow, frozen and white,
Wrapped street and square, mountain and moor.
That was his deed—
He did it well.
"What was his creed?"
I cannot tell,

Blessed "in his basket and in his store,"
In sitting down and rising up;
When more he got he gave the more,
Withholding not the crust and cup,
He took the lead
In each good task.
"What was his creed?"
I did not ask.

His charity was like the snow,
Soft, white, and silent in its fall;
Not like the noisy winds that blow
From shiv'ring trees the leaves—a pall
For flower and weed
Drooping below.
"What was his creed?"
The poor may know.

He had great faith in loaves of bread
For hungry people, young and old,
And hope-inspired, kind words he said
To those he sheltered from the cold.
For we must feed,
As well as pray.
"What was his creed?"
I cannot say.

In words he did not put his trust,
His faith in words he never writ;
He loved to share his cup and crust
With all maukind who needed it.
In time of need
A friend was he.
"What was his creed?"
He told not me.

He put his trust in heaven, and he
Worked well with hand and head;
And what he gave in charity
Sweetened his daily bread.
Let us take heed,
For life is brief.
What was his creed?
What his belief?

I've Been Thinking.

I've been thinking, I've been thinking,
What a glorious world were this,
Did folks mind their business more
And mind their neighbors' less!
For instance you and I, my friend,
Are sadly prone to talk
Of matters that concern us not,
And others' follies mock.

I've been thinking, if we'd begin
To mind our own affairs,
That possibly our neighbors might
Contrive to manage theirs.
We have faults enough at home to mend,
It may be so with others;
It would be strange if it were not,
Since all mankind are brothers.

Oh, would that we had charity
For every man and woman!
Forgiveness is the mark of those
Who think, "to err is human."
Then let us banish jealousy,
Let's lift our fallen brother,
And as we journey down life's road,
Do good to one another.

Souls, not Stations.

Who shall judge a man from manners?
Who shall know him by his dress?
Paupers may be fit for princes,
Princes fit for something less.
Crumpled shirt and dirty jacket
May beclothe the golden ore
Of the deepest thoughts and feelings;
Satin vest could do no more.

There are springs of crystal nectar
Ever welling out of stone;
There are purple buds and golden,
Hidden, crushed and overgrown.
God, who counts by souls, not dresses,
Loves and prospers you and me,
While he values thrones—the highest—
But as pebbles in the sea.

Man, upraised above his fellows,
Oft forgets his fellow then;
Masters, rulers, lords, remember,
That your meanest hands are men!
Men by labor, men by feeling,
Men by thought and men by fame,
Claiming equal rights to sunshine,
In a man's ennobled name.

There are foam-embroidered oceans;
There are little weed-clad rills;
There are little inch-high saplings;
There are cedars of the hills:
But God, who counts by souls, not stations,
Loves and prospers you and me,
For to him all vain distinctions,
Are as pebbles in the sea.

Toiling hands alone are builders
Of a nation's wealth and fame;
Titled laziness is pensioned,
Fed and fattened on the same.
By the sweat of other's foreheads,
Living only to rejoice,
While the poor man's outraged freedom
Vainly lifteth up its voice.

But truth and justice are eternal,
Born with loveliness and light,
And sunset's wrongs will never prosper
While there is a sunny right.
And God, whose world-heard voice is singing
Boundless love to you and me,
Will sink oppression with its titles,
As the pebbles in the sea.

Wishing and Having.

BY R. H. STODDART.

If to wish and to have were one, my dear,
You would be sitting now,
With not a care in your tender heart,
Not a wrinkle upon your brow:
The clock of time would go back with you,
All the years you have been my wife,
Till its golden hands had pointed out
The happiest hour of your life.
I would stop them at that immortal hour;
The clock should no longer run.
You could not be sad, and sick, and old,
If to wish and to have were one.

You are not here in the winter, my love,
The snow is not whirling down;
You are in the heart of the summer woods,
In your dear old seaside town.
A patter of little feet in the leaves,
A beautiful boy at your side—
He is gathering flowers in the shady nooks—
It was but a dream that he died!
Keep hold of his hands and sing to him.
No mother under the sun
Has such a seraphic child as yours,
If to Wish and to have are one.

Methinks I am with you there, dear wife,
In that old house by the sea;
I have flown to you as the bluebird flies
To his mate in the poplar tree.
A sailor's hammock hangs at the door,
You swing in it, book in hand;
A boat is standing in for the beach,
Its keel now grates the sand;
Your brothers are coming—two manly men,
Whose lives have only begun—
Their days will be long in the land, dear heart,
If to wish and to have are one.

If to wish and to have were one, Ah, me!
I would not be old and poor,
But a young and prosperous gentleman,
With never a dun at the door;
There would be no past to hewail, my love,
There would be no future to dread;
Your brothers would be live men again,
And my boy would not be dead.
Perhaps it will all come right at last.
It may be when all is done,
We shall be together in some good world,
Where to wish and to have are one.

Why?

BY MARY L. RITTER.

Why came the rose? Because the sun, in shining,
Found in the mold some atoms rare and fine.
And stooping, drew and warmed them into growing
Dust, with the spirit's mystic coustersign.

What made the perfume? All his wondrous kisses
Fell on the sweet, red mouth, till, lost to sight,
The love became too exquisite, and vanished
Into a viewless rapture of the night.

Why did the rose die? Ah, why ask the question?
There is a time to love; a time to give;
She perished gladly, folding close the secret
Wherein is garnered what it is to live.
—[Scribner for February.

Do Something.

If the world seems cold to you,
Kindle fires to warm it.
Let their comfort hide from you
Winters that deform it.
Hearts as frozen as your own
To that radiance gather;
You will soon forget to moan—
"Ah, the cheerless weather!

If the world's a "vale of tears,"
Smile till rainbows span it;
Breathe the love that life endears,
Clear from clouds to fan it.
Of your gladness lend a gleam
Unto souls that shiver;
Show them how dark sorrow's stream
Blends with hope's bright river.

HOW TO GET A GOOD FLOW OF MILK.

How to keep up a good flow of milk seems to be a question that puzzles many of our farmers. As soon as the feed begins to get a little short and dry, the flow of milk gets short, which shows conclusively that to keep up a good supply of milk the cows must have a good supply of green feed. If a farmer will take pains to have a patch of wheat, rye or barley sown that he can cut a quanty of each day to soil his cows with, the flow of milk will not decrease. A patch of corn or sorghum can follow the green grain, or a patch of alfalfa will answer the same purpose. It needs no new testimony to prove that it pays to soil dairy cows. It has been conclusively proven time and again. A good windmill will supply water to irrigate enough green feed for half a dozen cows through the entire Summer, where they have the run of a pasture and stubble fields in addition.

In order to have cows in good order when the green grass starts in Winter, every farmer should have stored a quantity of good hay to feed them twice a day. Even after the grass gets to be abundant enough to fill the stomach, it is found best to continue the feeding of hay. Cows that get plenty of good, nutritious hay, in addition to grass, never get sick and bloated on grass, but keep healthy and give a maximum quantity of milk. Straw is not so good, as it is hard to digest and does not supply the nutriment needed. No cow can give a good quantity of rich milk unless her stomach is in good order, her digestion perfect, and the supply of food is of good quality and plenty of it. If the pasture is so short that it takes up her entire time during the day to collect enough, then she will not give a full quantity, for she needs a good deal of rest as well as food. A good feed of hay in the yard or stable when green feed is short, or a soiling of green grain or corn fodder when the feed gets dry in pasture, will make it all right. A crop of vegetables, such as beets, squashes, etc., to feed when pastures fail in the Fall and early Winter, should be considered indispensable. Bran is good at any time of the year, but good, sweet hay is just about as good as bran. It should be remembered that hay for cows should be cut when quite green; for horses, it is better cut later than for cows. For instance, if it is wheat hay, it should be cut when the grain is in blossom for cows, and when it is in milk for horses. A horse seems to require more solid feed; he chews his feed finer than a cow does. A cow can digest green hay, or hay cut when quite green, better than she can hard hay, or hay cut after the seed is formed.

See that the cows have a plentiful supply of *clean* water, as pure as possible, at all times. And bear in mind that it is economy to *feed liberally*, and that without a full supply of nutritious food there will be a failure in the quantity and quality of the milk. And another thing is important: It will not do to let cows get poor at any season. They must be kept in good condition, or else they cannot be expected to give a large yield of milk even when feed is good and they have regained their lost flesh.

VILLAINOUS LAND TRANSACTIONS.

There is a good deal of villainy exposed nowadays. Investigating Committees are occasionally playing havoc with the designs of mean men, and either showing up their transactions, or preventing them from springing the traps that they have set to defraud honest people. There is need enough for investigation, it seems, in almost every public department; for wherever investigation is honestly conducted, there is almost sure to be found some rottenness. Perhaps in no instance was there ever found more blackness than has been and may be brought to light through the fraudulent land monopolies and grabs in California.

We have just been looking through the Reports of the Joint Committees on Swamp and Overflowed Lands and Land Monopoly, presented at the Twentieth Session of the Legislature of California, 1874. A mass of testimony, taken before the Committees, is here given, together with short reports of the Committees themselves. We wish that this book of 354 pages could be placed in the hands of every person who takes interest enough in such matters to carefully peruse it. We obtained ours by addressing the Secretary of State, Sacramento, and paying the expressage on it to San Jose. We think that the parties who appear by the testimony rendered to be absolutely guilty of dishonesty and fraudulent transactions, should be held up to the people in their true light, and be publicly published for their villainy, that they may be known as dangerous and untrustworthy. There seems to be one very prominent characteristic about these men who rob the people and government: They do not often back the face to put themselves forward whenever they think there is a hope of gaining prestige, and making something out of the confidence position can in any way give. For instance, we notice that one of the most conspicuous amongst the villains who are pointed out by the Committee is one Josiah Earle, the same, we believe, that holds or has an office close to the Grange headquarters in San Francisco, and the same that has issued, for extensive circulation, a Grangers' Emigrants' Guide to California, with the expressed countenance of the Executive Committee of the State Grange of California. And this, too, for the apparent purpose of getting the confidence of the thousands who are looking towards California for homes, that they may seek the same through him. Now, we take the privilege of publishing a portion of the Report of the Swamp and Overflowed Lands Committees, as showing their opinion of this fellow, founded upon the testimony given before them by several witnesses, that Grangers and other readers may form their own opinion of Josiah Earle, who would sail, under the Grange flag, as the Emigrants' Guide?

Your Committee is satisfied, from evidence, that the grossest frauds have been committed in swamp land matters in this State, but are unable to suggest proper remedies for lack of full information.

A great amount of interest has attached to what is known as the "Inyo Grab," attempted to be perpetrated by one Josiah Earle; and as this is a representative outrage of a general class of operations, your committee has felt constrained to give the subject matter a thorough investigation. Summarizing the evidence, we find: That the speculator in this case is the Register of the United States Land Office, at Independence, Inyo County—a position doubtless secured for the purpose of furthering his grand scheme of obtaining land not subject to location under the swamp land laws of the State, unless deception and fraud could be invoked to his assistance. This enterprising gentleman made application for one hundred and thirty-three thousand acres in Inyo County, about twelve thousand acres of which we find, by abundant evidence, are covered by bona fide pre-emption and homestead settlers, who have lived upon those lands for years, and many of whom are the oldest residents in the county.

The lands were surveyed by the General Government some years since, and returned as high, which they unquestionably are, as there can be *no* crops produced thereon *without extensive and constant irrigation*. This Mr. Earle (the applicant and Register in question) then made a peremptory demand upon Mr. Hardenbergh, the United States Surveyor General for this State, for the privilege of naming a local Deputy United States Surveyor to do this particular work, and of course in the interest of his friend Earle. This, fortunately for the unsuspecting settlers who knew nothing of it, was refused; as, had it been done, there would have been but little hope of redress for the settlers—had Earle been successful in procuring the selection of a tool ready to do his bidding in the segregation as "swamp" of these high, dry lands; and as Earle had himself appointed Register of the United States Land Office, probably in order to exercise his official position to further his personal interest in connection with this black and infamous transaction.

In furtherance of the same line of policy, one Joseph Seeley, acting as Deputy County Surveyor, received and forwarded the applications of Earle, and, to the mind of your committee, must have been aware of the perjury committed by Earle, stating that the land was "swamp," and that, "to his actual knowledge no residents or claimants" were in possession of the land.

With a less honest or vigilant Surveyor General—one who, for instance, would have listened, with willing ear, to Earle's statement that "we can get all the land over there"—this outrageous attembt at fraud and robbery might have been practicable; but the applications were refused, and the papers held for some hoped-for authorized examination.

Necessarily your committee started in uninformed, and not until after tedious investigation could we be able to recommend such legislation as would effectually reah and cure the gigantic evils which have grown out of the reckless land policy of the Government, and to provide a correction of the laws which have been so manifestly in the interest of the speculator.

LOSS OF MOISTURE FROM THE SOIL.

How to best utilize what moisture there is stored in the soil by winter rains, is a matter of much importance to farmers in this country, where we cannot depend upon Summer rains, and especially in places where irrigation cannot be resorted to.

Our grain fields should be so left that as little moisture as possible will escape through the surface soil into the air. We are satisfied that two or three inches of loose soil, left light and fine by harrowing, is better than to roll the last thing and leave the soil pressed down hard on the surface. The loose soil will act as a mulching to the moist soil underneath, while the soil that is pressed down will absorb the moisture from below and expose it to the air to be licked up and carried

away by the winds. This, we are satisfied, is as true in practice as in theory, and we accept it as a fact, notwithstanding some men may differ from us.

All plants absorb moisture from the soil where they grow. Most weeds are greedy absorbents of water, and no weeds should be allowed to rob the water from grain-fields and orchards. It pays to go over grain-fields and pull out mustard, and to cultivate and hoe orchards and gardens as long as there is any sign of growing weeds.

We call attention to experiments made in June, 1870, by Messrs. Lawes and Gilbert, of England, to ascertain not only the amount of water in land lying fallow, but also in that on which a crop of barley was growing. In making this experiment, each nine inches of earth, to the depth of four and a half feet, were separately tested. These analyses showed that an acre of dry soil three inches deep weighs 1,000,000 pounds or 500 tons; fifty-four inches deep weighs eighteen times as much, or 9,000 tons; when wet, about one-eighth more.

The following table shows the per centage of water in the land at different depths:

	Fallow land.	Barley land.	Difference.
1st nine inches . .	30.56	11.91	8.65
2nd " " . .	29.53	19.32	10.21
3d " " . .	34.84	22.83	12.01
4th " " . .	34.32	25.09	9.23
5th " " . .	31.31	26.98	4.33
6th " " . .	33.55	26.83	7.17
Mean . . .	30.65	22.09	8.56

From these figures is appears that the barley crop must have pumped up and evaporated 1,035 tons of water per acre.

Messrs. Lawes and Gilbert say: "As the excavation proceeded, barley roots were observed to have extended to a depth of between four and five feet, and the clayey subsoil appeared to be much more disintegrated and much drier where the roots had penetrated than where they had not."

Aside from the main subject of this article we can see plainly, by this experiment, one of the great advantages there is in

SUMMER-FALLOWING.

By summer-fallowing, that is, plowing the ground in the Spring and leaving the surface light, so that moisture cannot readily escape into the air, and keeping weeds and plants from growing that will draw away moisture from the soil, nearly all the Winter's rains remain stored in the soil during the season to be added to by another rainy season. The great benefit of summer-fallowing, then, seems to be the supplying of such soils as are not thoroughly saturated by one season's rain, with two season's rain for one crop of grain. At any rate, this is one very important consideration of summer-fallowing; and crops can be grown by this means, where, with but one season's rain alone, they would dry out before maturity. When grain is sown early so as to profit by all the moisture of winter weather, and the foliage covers the soil before dry weather, the growing grain in a measure protects the soil from drying sun and winds.

Farmers, Write Your Experience.—It is not so much by publishing new theories, as by keeping tried and tested facts before its readers, that the agricultural press benefits the farmers, and there is no one but may contribute something from his observation and experience that will benefit his neighbor.

A SAN JOSE PRUNE ORCHARD.

Probably the best prune orchard in the world is that belonging to Mr. J. M. Patterson, of San Jose. It is not a very extensive orchard—less than 2,000 trees—but it is a very profitable one. The trees, set in rich, moist, alluvial soil, 12 feet apart, are remarkably thrifty, and produce crops of very superior fruit.

Last season 600 Gross Prune de Agen trees produced some twenty-five tons of fruit, worth, at wholesale, not less than four cents per poind, or $2,000. The fresh fruit brought, in 20-lb boxes, in New York, twenty-five cents per pound, and in San Francisco was worth, nicely packed in small boxes, from six to eight cents per pound. The same variety of prunes, pitted and dried by the Alden process, were sold here, wholesale, to an Eastern firm for thirty cents per pound, and thee pounds of green would make one of dried fruit.

There were produced in the same orchard over five tons of the Petit Prune de Agen, a small, very sweet prune, and one in demand for its excellence. These are prized as drying prunes, and will only lose one-half by evaporation. The difference in flavor between this prune and the large Gross Prune de Agen is considerable: the small prune is very sweet, while the larger is quite tart for a prune. There were several tons of Damson plums and a quantity of Green Gages and other plums produced in this orchard, all of very fine quality. Every season the fruit is thinned out nearly one-half when from one-quarter to one-half grown, to keep the trees from overbearing. The advantage in this is, the trees are prevented from breaking and what fruit is left grows to a very large and uniform size.

Mr. Patterson's experience in the prune and plum business is valuable to himself, and would be to any one who contemplates going into the business of cultivating such fruit. He expresses the opinion that the Fellenberg is the very best prune for drying that has been yet produced. It is about as tart as the large prune, the pit separates freely from the fruit, and it dries very readily with little more loss than the small prune.

The "American taste," as a nurseryman said lately, while we were talking upon this subject, "demands tart fruits, and we have to be governed in our selections of varieties by this taste." With some exceptions, this is true; and probably a tart prune may be *more* in demand than the sweetest Petit Prune de Agen, although this fruit must always be in demand for its delicate flavor and sweetness.

Mr. Patterson says that the genuine Green Gage plum will long be in good paying demand for canning and jelly. There is a large demand and ready market for almost any quantity of such in the States east of the mountains. There is such a demand, in fact, that the Imperial Gage is palmed off for the Green Gage in cans and jellies. Also there are counterfeit jellies that never saw a plum at all. This Mr. P. spoke of as most deplorable, and a subject for investigation. California fruits are generally held, like California honey, as far superior to anything put up up East, and the business of putting up fruits here for the Eastern markets should be so firmly established in honest practice as to retain its good name and make it remunerative and satisfactory.

Mr. Patterson says that there is a difference of two years in the bearing age of plum trees between the budded and grafted trees, the grafted trees bearing two years sooner than the budded ones. This is his experience. Grafted trees four years in orchard, set when one year old, bore ten pounds each. When the trees are eight to ten years old they will bear one hundred pounds to the tree on an average. Ten acres in plums and prunes, on suitable soil, are all that any one family would want or need. It would bring in a liberal income every year. Twelve feet distant (300 trees to the acre) is far enough apart to set plum and prune trees in the orchard. Whenever a tree does not produce the variety of fruit wanted, he cuts the head off and grafts at once. It is poor policy to have trees in the orchard that do not produce the kinds that are profitable.

Mr. Patterson is, this Spring, whitewashing the trunks of the trees up into the limbs as far as he can reach handily, to kill all parasitic plants and insects. He is sure that lime wash does not injure the bark, but rather protects it from heat and drying winds by its coating, to the advantage of the tree. The surface soil is kept well cultivated, so as to prevent the waste of moisture from the lower soil by evaporation and to keep all weeds from exhausting the moisture and richness of the soil. He does not prune heavily, but thins out the fruit.

He is offered $2,000 a year for the fruit his orchard contains without further expense to himself than cultivating and caring for the trees. This, on about six acres of orchard, many of the trees of which are too young to bear much.

HOW THEY LIKE THE AGRICULTURIST.

We often receive cheering words from our subscribers who renew their subscriptions. We do all we can to make a good, practical journal, and of course we like to see that our efforts are in a measure successful. A lady writing from Washoe, Nevada, and paying two years in advance, writes: We all like your paper very much, and feel that we cannot do without it. May you gain a rich reward for the noble stand you have taken and maintained against intemperance and other evils; and that all true friends of Right may aid you is our fervent prayer.

Mr. J. T. Wood, of Carson, Nevada, paying his subscription and sending a new one, writes: I believe there is not another paper in America that furnishes so much useful reading for so small a subscription price. So long as I live you will have me for a friend and subscriber. You deserve to prosper, and no good man will keep you out of your subscription money. I will get some more subscribers. I consider it a loss to Nevada that the California Agriculturist has not a more extensive circulation here.

Moses Hopkins, of Nicolaus, Sutter Co., California, writes: "I prize your paper for

its moral tone and anti-humbug sentiments, and take pleasure in adding my name to the list another year."

Another subscriber, Mr. W. E. Cooley, a farmer near Los Angeles, sends some new names and says: "I am hoping to give your paper a start in this vicinity another year."

We have many good friends amongst our subscribers who are practical, earnest men and women, and who are working to advance the interests of the Agriculturist. We need the assistance of all, for it is slow work to build up a paper on its merits alone, without the aid of every one who can lend a helping hand. Papers that are run in the interest of railroads, land monopolies and corporations, and cater to any interest that offers pay, soon gain large circulations and are so upheld that success comes without a struggle. But a paper that hesitates not to attack any evil, and is conducted on principle, and is devoted singly to the greatest good of the honest portion of the community, does have a hard row to hoe, and if it cannot live and be made successful by the friends of rightful progress, it stands no show whatever. We have often said that we would sooner fail in a good cause than succeed in a bad one, but we rejoice that we are succeeding in a good cause, and owe much of that success to the good will and efforts of good people, our friends.

FATTENING BEEF-CATTLE FOR MARKET.

Last month we gave an account of A. N. Story's experience in fattening cattle on his farm. We then stated that this Spring his cattle would not bring the usual price—10 to 12 cents on foot—owing to an abundance of good feed and fat beef elsewhere. He has brought us an account of fifty head, sold at 7 cents on foot. He never before got less than 10 cents on foot for such beef at this season of the year. But notwithstanding the low price of beef this exceptional year, figures will show that Mr. Story is ahead on the enterprise. For the fifty head of cattle, the price paid, reckoning all losses out, did not exceed twenty dollars per head, or $1,000. The cattle, when fattened, averaged 700 pounds each, at 7 cents, $49 per head, or $2,450, which left $1,450 to pay for feeding. Mr. Story's farm of about 380 acres will fatten 100 head a year, besides raising other stock enough, with a diversity of products, to pay running expenses. At 7 cents this would be $2,900 a year income. But 11 cents has heretofore been the average price of his fat cattle in the Spring. Reckoning them at 10 cents and the weight at 700 pounds, 100 head fattened each year, and the figures will stand thus: 100 head cost $20 each—$2,000; 100 head bring $70 each—$7,000; increase in value—$5,000. We have reckoned no interest on money invested, nor Mr. Story's time, as every farmer has to put in his own time somehow. The way he manages, his expense for hired help is not heavy. Mr. Story always has hay or grain to sell, and is not confined altogether for resources to his cattle. Let any farmer reckon for himself, and he will see that raising and fattening stock, in connection with hay and grain farming, will pay.

Correspondence.

The Cultivation of the Olive in California.

BY JOHN D. SCOTT, M. D.

Eds. Agriculturist: The visitor to this State is as much astonished as delighted to see the groves of evergreen olive trees in and about the old missions so common in California. The cultivation of this beautiful and valuable tree has ever been associated in his mind with the sunny vales of France and the balmy airs of Italy. He forgets for a moment that the great Pacific Ocean Stream, bubbling up from the Torrid zone and laving and warming these Western shores, is doing for us what the Gulf Stream in the East, flowing across the Atlantic, does for Western Europe. It is well known that whilst England, France, Portugal and Spain are basking in warm sunshine, Nova Scotia, New Brunswick and the New England States, in the same latitudes, are shivering in the frigid grasp of Winter. A similar cause produces the same effect here. Whilst we are enjoying an Italian climate, our minister to China writes us that the denizens of the so-called Flowery Kingdom are bound fast in the icy fetters of Winter. It seems, then, to be one of the great climatic laws of our globe that the isothermal lines shall rise to very high latitudes on the Western borders of the two great continents, whilst they fall very low on the Eastern, giving a mild and genial climate to Western Europe and Western America, and a frozen one to Eastern America and Eastern Asia.

These trees were planted here by the Jesuit Fathers over three quarters of a century ago. Whilst Europe was being bathed in the blood of unholy and mad ambition, these noble, self-sacrificing men, tossed by the stormy waves of two oceans, or daring the untried perils of a trackless continent, were here in these Western wilds endeavoring to establish the Kingdom of the Prince of Peace—their sword the Word of God, their Standard the Cross. What more appropriate selection could they have made from the vegetable kingdom to remind them of their own native Italy,

"Land of arts and arms,
Where Nature spreads her richest charms,"

than the olive?—first harbinger of dry land at the Deluge, and ever after deemed the emblem of peace. Whilst the stately monuments of conquerors and kings will crumble into dust, the olive alone, ever self-producing and self-perpetuating, which these Pioneer Fathers first planted, here will keep their names and unselfish deeds as green in the memories of men as the emerald leaves upon its own boughs. The simple children of forest and plain whom they were accustomed to gather around their holy altars for morning and evening worship, are scattered and gone; the mission villages they established are fading into the dim twilight of history, and even the stately temples of God, so sacredly cherished and so elaborately adorned with the painted scenes of the Apostolic age, are fast crumbling into the dust whence they arose. But the olive will never die. Having found a soil as congenial, and a climate and skies as warm and beautiful, as ever blessed its native Italy, it will go on increasing in numbers and usefulness until the teeming millions of the Pacific shall rise up and call its first propagators "blessed."

There are many hundreds of these trees now flourishing and in full bearing in the various missions in this State. They have proved hardy and productive, so that their cultivation here is not a matter of venture or experiment. If the recommendation was now first made to plant the olive—if we were called on to send to France or Italy for our first trees, at great risk and expense, to enter upon an uncertain and untried business, there would be great reason for hesitating in following the advice. But, as we have indicated above, all these experiments have been made for us, and they have proved eminently successful. The trees grow here thriftily, bear abundantly, and many hundreds of gallons of oil are profitably manufactured from them yearly.

In addition to its commercial, the Olive has an ornamental value. Its perpetual verdure is most grateful to the eye, its shade is dense and cooling, and when loaded with its dark purple berries, it presents the appearance of millions of jets set in oceans of emerald green.

The trees are easily, cheaply and rapidly propagated by pieces of the roots, suckers, seeds, or cuttings. The latter mode is most generally adopted. A trench is dug six or eight inches deep, and the soil thrown out on one side. On this inclined bank cuttings about a foot long and from one to one and a half inches in diameter, are laid about a foot apart. The ditch is now filled up and the soil drawn up to near the top of the cuttings. But one stem is permitted to grow. The soil is kept loose about the young trees and free from weeds. They are watered occasionally, and at three years old they are ready for the orahard. Their distance apart is 36 feet in light, hilly soil; in rich soil, 48 feet. Vegetables, corn, beans, and other light crops may be cultivated in the inter-spaces to help to pay expenses until the olives come into full bearing. They begin to bear here in the sixth year, sometimes earlier, and the fruit may be profitably gathered and converted into oil about the tenth or twelfth year.

Would it not be advisable for our fruit-culturists, in setting out orchards, to give an olive tree every fourth space? When the short-lived trees shall have perished, the olive will be in full bearing, and will constitute an inheritance of incalculable value. A full-grown tree produces from 50 to 75 gallons of oil annually, which at $4.50 per gallon would far outstrip in value any other fruit tree—the far-famed Los Angeles orange not excepted. Some exceptional trees have been known to yield 300 gallons each in a year, which would be worth more than the whole annual product of some farms that we are acquainted with.

As the oil contains the same principles as fresh butter—*olein* and *margurin*—its universal use in the south of Europe, in all culinary preparations, is at once obvious. The people there use it in the thousands of ways in which we here use pork, bacon, lard and butter.

The reason why it is looked upon with so much repugnance by our people is that we very seldom see a fresh article. When it reaches us it is generally old and strong, and consequently unpalatable. There is as much difference between the freshly pressed oil, which has a sweet, nutty flavor, and that which we see generally in our market, as there is between nice, new-made butter, just from the churn, and the strong, rancid article "old enough to speak for itself." Hence, to popularize its use, it must be raised in our own country, when a healthy and valuable article of food will be added to our productions. We cannot have too many food products. "We know not what a day may bring forth." A nation, to be truly independent, must not only be so politically, but gastronomically. Full stomachs are deadly foes to bread riots.

France lost nearly all her olive trees from cold in the years 1709 and 1788. The frosts of that country sometimes kill the extremities of the the bearing limbs, thus cutting off the crop entirely for that year or very much diminishing it. Neither of these accidents have ever been known to happen here, so that, with full crops every year at a fair remuneration, that profit would be greatly enhanced in cases of partial or total failure of crops in Europe. Prior to the disastrous year of 1788 France consumed $15,000,000 worth of oil, yet was compelled to import $6,000,000 more to supply her home demand. England imported, in the year 1830, 2,791,057 gallons. In 1850 the United States imported $91,600 worth; in 1855, $165,173, and in 1859 $535,-975. Some idea may be formed of its commercial value when it is known that the little kingdom of Naples exports annually 7,300,000 gallons. Now, as the olive is a sea-side tree and grows to absolute perfection in all our southern coast counties, a very short calculation would go to show that, with a little foresight and industry, California would soon become the oil mart of the world, as Italy is to-day; for each one of our coast counties would make, perhaps, half a dozen Naplesses. And this need not be at the expense of the rich wheat land of our valleys, for the olive is known to flourish equally well, if not better, on rolling, rocky lands, of which we have millions of acres in our foot-hills that could not be applied to a better purpose. And when these acres shall have been covered all over with olive trees, in full bearing, the question as to "what shall we do with our boys and girls?" will be of easy solution in the short and appropriate answer "Set them to picking olives."

The olive tree is of extraordinary longevity. Some are known to be 400, others 700 years old at the present time, and bid fair to flourish for many centuries yet to come. There are some in Italy which are supposed to have been in existence since the time of Pliny. Others still linger about the Mount of Olives, but whether they ever extended their sheltering boughs over the kneeling Savior, history, perhaps, will ever be silent.

Its timber constitutes one of the most valuable of woods. It takes a high polish, and is greatly prized by cabinet-makers. It is used extensively in in-laying with other valuable woods. The wood of the root, when polished, presents a marbled appearance, and is used for making snuff-boxes, dressing cases and other ornamental articles.

Dried, pickled and preserved olives are used as food.

The bark and leaves are used in medicine as astringents, tonics and febrifuges.

The gum resin which exudes from the trees is used in perfumery.

The oil makes very superior castile and toilet soaps.

It forms an important ingredient in hair-oils, cosmetics, plasters and ointments.

Large quantities of it are used in woolen mills in dressing cloth.

Before the discovery of petroleum, it was universally used for illuminating purposes.

Jewelers use the finest of the oil in lubricating their watch and clock works.

Mixed half and half with lime water, it forms one of the best applications for burns and scalds. Every family should keep a bottle of this mixture on hand in case of emergency.

Rubbed all over the body, it is said to have afforded protection from the plague; but whether this be true or not, its external use is growing rapidly in favor with the regular profession in diseases of the chest, bowels and joints. Extreme unction, as it might be called in these cases, has been known to act like a charm in the last stage of croup, when everything else had failed to afford relief.

It is a valuable antidote to a great many poisons, and is believed to act efficiently in this way in poisonous doses of strychnine.

With so many uses for it already, and when we manufacture a sweet home article to be universally used in our culinary preparations as it is used in Europe, there is not much danger of our ever stocking the market with oil, at least for several centuries to come.

There are different varieties of the olive, as there are of the apple and pear. These are perpetuated by cuttings, grafts or buds. New varieties may be produced by planting the pits, just as in the case of plums and peaches. Those who have the means and leisure could not employ their time more beneficially to their country or profitably to themselves (since the late act of Congress securing absolute ownership to new varieties of fruit) than to plant the seeds and raise new varieties of this beautiful and valuable tree.

No long or tedious process, no expensive machinery is required to secure the oil. A cheap apparatus, something like our old cider mills, bruises the fruit from the stones and reduces it to a soft pulp. This is separated from the pits and placed in a common lever or screw press, when the oil is gradually forced out of it. The pits are afterwards crushed and afford an inferior article. The oil is received into wooden or earthen vessels where it is permitted to stand from twelve to twenty-four hours to allow the mucilage to settle. The oil is then carefully poured off into barrels, where it rests twenty days, when it parts with any remaining impurities. The oil cake is broken up, mixed with warm water and subjected to a second pressure, when an additional quantity is obtained equal to the first. The refuse is then converted into a valuable fertilizer, so that nothing is lost. One hundred pounds of olives produce about twenty-seven pounds of oil.

Mr. James Lick, the great California philanthropist and millionaire, with that peculiar foresight which enabled him to amass a colossal fortune, did not overlook the olive. With that presence which has distinguished him in all his financial operations, he early foresaw the immense value of this industry and planted an olive orchard of several hundred trees on his place adjoining this city on the southwest, which is just now coming into bearing, at about nine years old. He proposes to begin, next season, the manufacture of oil. Far down in the distant future, when these trees shall have attained their full growth, and produce thousands of gallons of oil annually, men will assemble beneath their cool and refreshing shade and, without a dissenting voice, will pronounce that olive orchard one of Mr. Lick's best and most productive investments.

The expectation of sudden riches has hitherto been the bane of California. The fabulous mineral wealth of the country in the flush times of '49, and the almost equally wonderful advance in real estate, have well nigh turned men's minds. They are even now loth to enter the trodden paths of patient industry. But the lessening chances of speculation, the fall of interest and the rapid increase of a competitive population with Eastern ideas of business, are fast producing that equilibrium which alone guarantees a sound and permanent basis of prosperity. Far-sighted business men are learning to be content with a less, because a more certain, profit. Instead of running after bonanzas, they are investing their surplus funds in lands, buildings and manufactures. And among their profitable investments there is none better than the planting of olive orchards. Besides, this is in the line of that diversified industry which can only render a people great, rich and truly independent.

Many of the lower animals, with a wonderful instinct, lay up provisions for the immediate future, but man, with higher intellectual endowments and a loftier ambition, lays up treasures, not only for the immediate, but for the remote future. This looking forward—this anticipation of the wants of coming generations, can only be indulged in by beings "longing for immortality." This laudable attempt to perpetuate ourselves in the physical surroundings of earth is but an exponent and measure of the "divinity within us," and the more this wise forethought is exercised, the higher we rise in the scale of excellence. Then plant the olive for the future—plant it for posterity—plant it for the coming millions—erect for yourself a monument that will out-last empires—plant the tree that produces the oil of gladness that it may be poured upon the "troubled waters" of the future—plant the emblem of peace.

San Jose, April, 1875.

Curious Epitaphs.

BY ELISA E. ANTHONY.

Eds. Agriculturist: I send you a few epitaphs, humorous and curious, which I found in an old book lately, some of which may afford your readers as much amusement as they did me.

The following epitaph was written by Franklin many years before his death:

"The body of Benjamin Franklin, printer, (like the cover of an old book, its contents torn out, and stript of its letters and gilding) lies here, food for worms; yet the work itself shall not be lost, for it will (as he believes) appear once more in a new and more beautiful edition, corrected and amended by the Author."

Fuller, the well-known author of British Worthies, wrote his own epitaph as it appears in Westminster Abbey. It consists of but four words, but it speaks volumes:

"Here lies Fuller's earth."

Byron's misanthopy vented itself in an epitaph on his Newfoundland dog, which he concluded with the following lines:

"To mark a friend's remains these stones arise;
I never knew but one, and here he lies."

The following is a copy of an epitaph in the church-yard at North Shields, which has been the subject of much laughter to many persons on account of its absurdity:

"In memory of James Bell, of North Shields, who died 16th of January, 1763, aged 42 years. Margaret, widow of the above said James Bell, died Dec. 30th, aged 49 years. She was wife after to Wm. Fenwick, of North Shields."

The following lines were written underneath it with a pencil:

"As in the Scriptures it is said,
No marriages in heaven are made,
It seems that Margaret's ghost did go
To Pluto's dreary realms below,
Where she, poor soul, not long had tarried
Till her friend Will and her got married."

The following quaint epitaph is copied from a church-yard in Finsbury, near Chatham:

"Time was I stood as thou dost now,
And viewed the dead as thou dost me;
Ere long thou'lt lie as low as I,
And others stand to look on thee."

How true is the above!

The following is an inscription on a tombstone in Massachusetts. It is beautiful:

"I came in the morning—it was Spring,
And I smiled;
I walked out at noon—it was Summer,
And I was glad;
I sat me down at even—it was Autumn,
And I was sad;
I laid me down at night—it was Winter,
And I slept."

A gentleman traveling in Europe copied the following lines from a tombstone in a graveyard in Llangollen, North Wales:

"Our life is but a Winter day—
Some only breakfast and away;
Others to dioner stay, and are well fed;
The oldest man but sups and goes to bed;
Who goes the soonest has the least to pay."

In Luton Church-yard, Bedfordshire, an uncourtly voice from the dead to the living speaks as follows:

"Reader, I have left a werld
In which I had much to do,
Sweating and fretting to get rich—
Just such a fool as you."

SAN JOSE, March, 1875.

Household Reading.

A Farmer's Wife I'll Be.

I am a wild and laughing girl, just turned of sweet sixteen,
As full of fun and mischief as any you have seen,
And when I am a woman grown no city beaux for me,
If e'er I marry in my life, a farmer's wife I'll be.

I love a country life; I love a joyous breeze;
I love to hear the singing birds among the lofty trees.
The lowing herds, the bleating flocks make music sweet for me.
If e'er I marry in my life, a farmer's wife I'll be.

I love to feed the chickens, I love to feed the cow;
I love to hear the farmer's boy whistling at his plow;
And fields of corn and waving grain are pleasing sights for me,
If e'er I marry in my life, a farmer's wife I'll be.
I love to see the orchards where the golden apples grow;
I love to walk in meadows where sparkling streamlets flow.
The flowery banks and shady nooks have many charms for me.
If e'er I marry in my life, a farmer's wife I'll be.

Let other girls who love it best, enjoy the gloomy town,
And dusty streets and dirty walks to ramble up and down;
But flowery fields, and shady woods, and starry skies for me.
If e'er I marry in my life, a farmer's wife I'll be.
—[K. V. R. M.

BEAUTIFUL maidens—aye, nature's fair queens,
Some in your twenties and some in your teens,
Seeking accomplishments worthy your aim,
Striving for learning, thirsting for fame,
Taking such pains with the style of your hair,
Keeping your lily complexions so fair,
Miss not this item in all your gay lives—
Learn to keep house, you may one day be wives.

Chats With Farmers' Wives and Daughters---No. 5.

BY "JEWELL."

Now, girls, I want you to feel, that in recounting the experiences of this *pet* farmer's wife of mine, I am simply showing what any one of you *may* do when *you* marry a farmer, provided you only begin right. But to expect the present farmer's wife to change her mode of life, or to suppose the *old farmer* willing to *allow* of such a change, is not to be thought of; and yet it could be done, provided the *will* was strong enough to do it. This is the story she told me of her experience in farm life:

When my husband concluded to go to farming I opposed it—had never lived on a farm and knew nothing of it save its hardships as I had seen them. So we compromised by saying I should have only one hired man to cook for, and only as many cows and chickens as I cared to see to myself. I have a fine lot of fowls and make butter from half a dozen good cows, and always get the best prices; making more money than many who keep twice the number. It is now four years since we started, and if we don't grow rich as fast as some of our neighbors, neither of us are broken down and life has not been robbed of all of its joys.

In haying time and harvesting the grain, we let the work out by contract some years, we putting up a tent and the men feeding themselves. Once we hired the men and furnished rations for them to cook, but it did not work so well. Two years in succession we had the same men come to us. We have two meals a day the year round—breakfast at eight and dinner at two. In summer there was a good two hours work before breakfast and no complaint from any good man. Also, there is always plenty of cooked food in the pantry for a supper if any one wants; but I felt it a duty to myself and children, and would not sacrifice all for money. A living we are sure of. Our expenses are light, though we subscribe for as many books and papers as we can read; but I buy few fine clothes—we don't need them, and I don't aspire to dress as city ladies do, but only for my work and comfort—one suit a year to go to town in is enough.

Such is the substance of her experience, which I thought good at the time, and the older I grow the more practical I believe it to be. The idea that a farmer or his wife should be obliged to work earlier and later than any other laborer is simply absurd. I know they do, but does that make it right? I also know that if they would put the night into work as well as the day they would accomplish more srill. Why don't they do it? They say plants set out at night flourish best. Their answer and mine is, that nature requires rest. If so, then take it—don't overwork if you don't get rich so fast; better be poor and robust than rich and broken down—unable to enjoy life.

And right here let me answer "M. E. O. W." who, I see, takes me up on the "two-meal" question, she believing that farmers need to eat oftener than other people. I will reply by saying that what *has* been done *can* be done again. I know of a farmer in New York State who for years has practised the two-meal system with perfect success—cooking no meat either, and the same gang of men would return three or four years to harvest, liking the plan and food, saying they worked easier and accomplished more than under the old system. I do not give my own experience simply because I am a looker-on, and know no more about the success or failure of either plan than "M. E. O. W." herself, who only tries one way and condemns the other. I do know from observation, however, that most farmers practise the three-meal system and believe it the only way to do. Under the two-meal system, with a simple, light lunch in the evening when needed, the necessary number of hours' labor can be done in the field during the day with less trouble. More rest for limbs and stomach can be taken and enjoyed. Under the three-meal system how about the wives? Where does the rest come in to them? I dined with one the other day, and took notes. The wife had been busy and on her feet since early daylight, and besides getting dinner over the hot stove, waited on the family and helped the children, never sitting down till the men-folks had finished eating and left, when she sat down at the table a few minutes, ate a little cold potato and fried bacon, bread and butter, drank a cup of tea and was ready to clear the dishes off and begin work again. This woman has China help provided too; but then there is plenty for all to do, she says, with dairying, cooking, etc.

No wonder the nursing baby gets fed with bread and milk while mother is busy getting dinner; no wonder the child thrives better on rested cow's milk than on the *tired* mother's milk; and no wonder that so many of our farmers' wives bring their babies up on the bottle nowadays. Amongst the wives in one Grange that I know of, out of seven babies born during the past six or eight months, five are being brought up on the bottle. The mothers are unable to nourish their babies after birth. Query—Can they be perfectly nourished before? How is this for blooded stock, Farmers? What would you say to a breed of cows that could bear but not suckle their young? I do not say a word against the labor of man or woman. All is enobling, provided they do not do too much of it. Dish-washing is as truly necessary and as fine as any other duty when it is well done. The kitchen is, or should be, as truly genteel as the parlor, and every room in the house should be a part of a perfect home. I have seen ladies in the parlor whose discords on a piano wrung my heart, and a poor excuse in the kitchen is just as bad. But bringing the matter to a practical point—surely, by bad management or something wrong in theory, our farming population are not generally the most healthful, the best provided for, the most intelligent nor the happiest, indoors or out. They should be, and may be, too, if the best system of labor, eating, rest, recreation, etc., are adopted and intelligently *lived*, in accordance with reason and right.

Hints upon the Subject of Training Children.

WHAT TO TEACH.—The child should be taught that his eyes, ears, hands, all the organs of his body, all the faculties of his mind are his servants, and that it is his business to see to it that they serve him faithfully, that they report accurately what is passing about him and respond promptly and fully to his demands. Such sentences as "I didn't notice," "I heard but I don't remember," have no business in a child's vocabulary. He should be taught to apprehend clearly, that to say "I forgot" is only another way of saying "I did not care enough to remember." Educate the faculties to prompt action, teach the senses to respond fully to every impression made upon them. When you give a command or communicate a thought to a child, secure his attention, use the simplest and most direct terms and do not repeat them. Superfluous words are demoralizing and reiteration a bid for inattention. Some of us are born clods; more of us become so through vicious training. Make the child self-conscious and you have established an enduring feud between him and his capabilities. Henceforth his feet are an embarrassment to him, and no number of pockets is adequate to the satisfactory bestowal of his hands. He fancies all eyes are upon him, and his very blood turns mutinous and flies in his face without just cause or provocation. It is his right to be unconscious; to develop from within outward as sweetly and unostenta-

tiously as a flower; not to be thrust into notice by having his sayings and doings repeated in his presence, nor snubbed into silence and conscious inferiority by being constantly reminded that "children should be seen and not heard." Hardly anything is more essential in the management of children than the kindly ignoring eye that does not notice too much. I pity the child who is the centre of a blindly doting or injudiciously critical family, whose every saying is repeated, every act commented upon, and where, in consequence, naturalness is impossible.

Polite Children.—"Thank you, Charlie," said Mrs. Brown, as her little son handed her a paper he was requested to bring.

"Thank you, Bridget," said the little fellow a few hours after, as he received a glass of water from his nurse.

"Well, Mrs. Brown, you have the best mannered children I ever saw," said a neighbor. "I should be thankful if mine were as polite to me as yours are to the servants. You never spend half the time on your children's clothes that I do, and yet every one notices them, they are so well-behaved."

"We always try to treat our children politely," was the quiet reply.

This was the whole secret. When I hear parents grumbling about the ill-manners of their children I always wish to ask, "Have you always treated them with politeness?"

Many parents who are polite and polished in their manners toward the world at large are perfect boors inside the home circle. If a stranger offer the slightest service he is gratefully thanked; but who ever remembers to thus reward the little tireless feet that are traveling all day long, up-stairs and down, on countless errands for somebody? It would be policy for parents to treat their children politely for the sake of obtaining more cheerful obedience, if for no other reason. The costless use of an "If you please" and "I thank you," now and then, will go far to lighten an otherwise burdensome task. Say to your son, "John, shut that door," and with a scowl, he will move slowly towards it and shut it with a bang. The next time say, "John, will you shut the door, please?" and he will hasten with a smile to do your bidding.

Putting Children to Bed.—We have seldom seen anything more impressively appropriate than the suggestion made by an exchange relative to the manner of putting children to bed without reproof for any of that day's sins of omission or commission. Take any time but bed-time for that. If you ever heard a little creature sighing and sobbing in its sleep, you could never do this. Seal their closing eyes with a kiss and a blessing. The time will come when, all too soon, they will lay their heads upon the pillow lacking both. Let them then, at least, have this sweet memory of a happy childhood, of which no future sorrow or trouble can rob them. Give them their rosy youth. Nor need this involve wild license. The judicious parent will not so mistake my meaning. If you have ever met the man or the woman whose eyes have suddenly filled when a little child has crept trustingly to its mother's breast, you may have seen one in whose childhood's home "dignity" and "severity" stood where love and pity should have been. Too much indulgence has ruined thousands of children—too much love not one.

Remember.—Whatever you wish your children to be, be it yourself. If you wish them to be happy, healthy, sober, truthful, affectionate, honest and moral, be yourself all these. If you wish them to be lazy, and sulky, and liars, and thieves, and drunkards, and swearers, be yourself all those. As the old cock crows, the young one learns. You will remember who said, "Train up a child in the way he should go, and when he is old he will not depart from it." And you may, as a general rule, as soon expect to gather grapes from thorns or figs from thistles, as to get good, healthy, happy children from diseased, lazy and wicked parents.

Scolding.—What good does scolding do? It does no one the least service, but it creates infinite mischief. Scolded servants never do their work well. Their tempers are roused, as well as the mistress's, and they very often fail in their duties at awkward moments, simply to spite her and to "serve her out." Very wrong in them, doubtless; but human nature is frail, and service is a trying institution. It does no good to husband or child, for it simply empties the house of both as soon as possible.—*N. Y. Observer.*

Stock Breeder.

Utility Above Fancy in Breeding.

If we were to judge of the character of our stock breeders by the prices occasionally paid for fancy animals under the influence of unusual competition or wild excitement, as at the New York Mills sale of last year, for instance, we should undoubtedly do great injustice to the average American breeder, who is, after all, a thorough utilitarian, and knows that real merit will win, in the long run, in this, as in every other kind of business.

Mr. J. H. Pickerell, of Illinois, the newly elected President of the American Association of Short-horn Breeders, is one of the right kind of men to bring the ideas and practices of the Short-horn breeders down to a solid, hard pan foundation, if they are in need of such training, as it has certainly seemed to us that they have been for a year or two past. His lecture, delivered at the annual convention of Short-horn breeders at Springfield, Ill., last January, is one of the most sound and sensible productions we have read on the subject of breeding for a long while, and we commend it to the attention of breeders everywhere.

No one who breeds Short-horns intelligently, either with an eye to profit or pleasure, but has his fancy, both as regards the real, living, moving animal, and the paper Short-horn, with pure ancestry pedigreed. Then there are particular fancies in regard to the horns, their size, shape, length, color; points in or points out, points up or points down; fancies about the mane, its shape, size and color—tints that the skin should be; size of the head, length of the face, width, etc. Then the jaws, eyes, ears, throat-latch, etc. The same in regard to long necks and short necks, thick necks and slim necks, chubby necks, etc.; shoulders set right or obliquely, thick or thin, heavy or light, rough or smooth, points bare or covered; brisket prominent, smooth, wide, narrow, low down, plump or flabby; crops thick or thin, sharp, high or low; thick or light "through the heart," long ribs or short ribs, high sprung or low sprung, ribbed up close or long coupled; thick loins or light ones; same of hips and flanks (fore and aft); rumps up or down, square or peaked, long or short, smooth or straight; quarters long or short, square or cut in; twist full or straight, twisted in or twisted out; hind legs long or short; bones fine or coarse, straight or crooked; tail fine or coarse, long or short, with the bush do.; white or red; hide thick or thin, mellow or hard, yellow or white; hair coarse or fine, long or short, thin or "full of hair."

Then the color, from plain white to fancy red, with all the tints and shades imaginable between the two. Then the general "make-up" and finish, as a whole; style and carriage. Fancies about pedigree, whether of this stain (pr family) or of that; whether one cross, six crosses, or sixteen, makes a thoroughbred, or a full-blooded; wether, if the dam runs to a certain starting point, with the sire of some other blood, makes it more of that family or vice versa; or whether, if the pedigree is right, it makes any difference about the animal at all. Then there are prejudices in favor of and against everything named, and many more, perhaps. How far do these things bear out, for or against, the real or useful, to their advantage or disadvantge? That's the question.

The intrinsic value of the horns, is, perhaps, about twenty cents—worth but little to the animal for protection, as a "muley" frequently masters the whole herd. Their real value is as an index to the breeder, which is very frequently—nearly always by our awarding committees at our fairs—taken the wrong way. As many a good animal has been discarded, thrown out, or sacrificed, for having a heavy horn—placed behind an animal having a delicate, steer horn—when, perhaps, in real merit the first had hundreds of pounds of meat in valvable parts more than the other. While we fancy horns of a peculiar kind, we must be careful not to let our prejudicea run away with other merits of real value, for while a heavy, coarse horn may not be an advantage, or desirable, a light, delicate one, other things being equal, should always be objected to in a bull. The nose of itself is valueless when it comes to the block. All admit that the most fashionably bred and fancy pedigrees occasionally show black noses.

In regard to the color, it has been said that the fashionable color of to-day was once an actual objection. Then the color does not establish the blood; nor is there any positive proof that the quality of the meat is governed by it. May we not well ask, Is there anything more than prejudice in the color of the nose? Yet fancy sacrifices many good animals on account, not only of a black, but of a smutty nose. The head of a dead animal, of itself, is worth but little, and like the horn, is more of an index to the living animal than real worth. It is true, in weight, it amounts to something more than it comes to at the lowest price paid for beef. Then after the true value—which, like the horn, is often misconstrued—in the living animal is considered, we should not let a fancied defect (of course I do not allude to a malformation, which should always be discarded in breeding animals) prejudice us too much against other real merits of the animal. The throat-latch (to use a common expression) is required by fancy to be light and slim, and for a little chubbiness the whole animal is made to take a back position, while it is very generally a good index to a good feeder and a thick animal. It seems curious that our half-fledged Short-horn fanciers generally see more to condemn than to commend, very frequently sacrificing the real merits for a few fancy points. Fancy puts great stress on a long, slim neck—one that can hold a high head. Reality says that a neck that is long enough to reach to the ground to drink and eat is long enough. Unnecessary weight is objectionable, because it is low priced beef, and the less of it the better, other things being equal. In our prejudice we forget that a thick, short neck sometimes weighs less than a long, slim one, besides being generally carried by a body that corresponds, especially as to thickness. Fancy, perhaps looks over more and carries it further into the ranks of breeders in the shoulders than most any part of the animal.

In our prejudices against minor defects we frequently overlook more real merits and pass them by, letting light, sharp tops, bare points and coarseness generally in the shoulder, take the lead. Really, there is about as much difference in the value of the shoulder by the way it is formed, as any other portion; a poor, thin, coarse shoulder is a loss always in point of real value, behind a good or smooth one, that nearly approaches, in point of value the higher-priced beef. Here, too, we get great weight. Consequently, the shoulder should be considered a more weighty matter

than some of the light fancies. Fancy places great stress on the brisket. Reality (the butcher) says it is not high-priced beef, and, intrinsically, worth but little. A long, prominent brisket adds weight to low priced beef with out adding to the real value as an index to a broad chest and strong constitution. Fancy makes a strong point in favor of a heavy brisket. The fore legs—and hind ones too—fancy overlooks sometimes, and substitutes mill-posts in size and many inches in length. Reality says that soup is good, but costs too much to make coarse shins profitable as they never sell for what they cost in the carcass. Great weight in the crops adds to the value of other parts per pound over light ones. Fancy and prejudice frequently overlook this fact—forgetting that light crops are classed as low priced beef, while heavy or thick crops, besides taking the weight from the paunch and offal, add to the weight of the high and valuable parts. Fancy, and prejudice also, frequently makes great sacrifice in the heart, as the light and delicate points so much admired, generally carry the same delicate proportion to the heart, the most vital part of the beast.

If the animal is light "through the heart" and behind the shoulders, the action of that organ will be hampered and the robustness of the animal will be diminished. Fancy overlooks many faults in the loins and hips; while usefulness says that the ribs should be well sprung—"round as a barrel"—and not too short; a little paunchiness can be overlooked, as a good feeder generally has some place to put it. Loins are fancy cuts in reality, and should, if thick and broad, even if a little arched, overbalance many minor defects of other points. Broad loins necessarily make wide hips, but they should not be rugged, or rough—not too prominent, especially in a bull.

Flanks are quite important, if good, and of but little importance if light. The fore-flank especially should be full, to give room for the internal organs, and to add to the value of the plates. A low, thick hind flank is also very desirable, adding weight without occupying space that is needed for anything else. Great weight is added to valuable parts by having the rumps straight and square, carrying their width well down to the quarter. Peakedness is really objectionable, and, if it comes from hips too wide, they had better be narrowed. Fancy frequently protrudes the quarters—rounding them up behind, which is frequently done at the expense of their length, making them "cut in" and too short, besides adding coarse meat. The twist should be well let down, and full, as daylight is not much needed at that point. The quality of the quarter is much enhanced by being increased in weight in a few points at no expense of space. "Steak" comes down better in a straight hind leg than in a crooked one. Thigh bones are necessary, but might just as well be covered with meat as be bare. The shorter from the ground to the hock, and the longer from there up the better. As hind leg soup is no better than fore leg soup, the less the better. Fancy runs wild on the tail, condemning an animal frequently on account of its length or shortness, even the brush coming in for a full share of condemnation or praise—I suppose on the ground that "the beautiful should be encouraged, as the useful will encourage itself." "Ox-tail" soup is about its only use—after fly-time.

Fancy "goes in" on the hide with no little prejudice for or against certain imaginary qualities that are frequently taken as superior to the best forms and largest preponderance of valuable parts. Especially is the fancy of feeling qualities, when taken against the form of an animal, overestimated, as many thick or hard-hided animals that are well formed will testify by their quick growth and heavy weights. The quality of the flesh is what is wanted, and reality says that the feeling quality of the hide does not always determine that. Of course the color, thickness, pliability, etc., of the hide is more of an index than a reality of itself. A good covering is needed, and that is why the animal has a hide at all. It is true we take advantage of it, and sometimes get our foot in it in more ways that one. The same might be said of the hair, for, after nature is provided for, the balance is nearly all fancy. The color of the hair, varying from white to red, which are sure tokens of Short-horns, is much more fancy than reality, and our prejudices are governed more by this difference than men are willing to acknowledge. So in regard to pedigrees. Fancy would lead us to a different conclusion, from the way it runs crazy after some old bull that lived perhaps a hundred years ago, with no more than a number for a pedigree—condemning others, without any more reason, for doing the same thing. Reality says that pedigree fanciers live in "glass houses" and should be careful about "throwing stones." Reality says that pedigree and form constitute the animal, and that either without the other will surely "play out" in the end. How far we can follow fancies and make stock profitable is a question that time alone can settle. That many are guilty (more or less) of following fancy to the sacrifice of reality, no one can successfully deny. For my own part, any fancy (or whim, if you please) that I can follow, without sacrificing usefulness, that will please my customers—that they are willing to pay for—I intend to follow just as long as they are in that notion; but I am not willing, while fancy demands a sacrifice of usefulness, to follow in the fashion, even at the risk of being called an "old fogy." These points may be too strongly presented—overdrawn. If so, the writer only has to apologize, because he thinks there is danger enough already to warrant it. He would suggest that others make a note thereof, and then do as they please, of course.—*N. E. Farmer.*

High-Priced Stock.—English agricultural journals are having quite a warm discussion on the subject of the high-prices being demanded and paid for Short-horns of certain strains. The *Agricultural Gazette* thinks the matter entirely overdone, while the *North British Agriculturist* takes the opposite side. It says: Those high-bred and high-priced Short-horns which have of late come in for so much abuse at the hands of certain agricultural journalists, cost perhaps too much money, but that breeding entirely from certain strains is a mistake, is open to question. Take two representative bulls, the Duke of Devoushire's Duchess bull, and Lord Erwin; say nothing about pedigree, the latter may in a sense be the best beast; but there is no man, half a judge, not to speak of pedigree, would prefer him to the Duchess bull.

* * * * * * *

So it is with Bates and Booth cattle of high descent. The big prices are the very thing that keeps the stream pure and helps to fertilize the whole Short-horn world. There is a certain potency in a small quantity of this high-bred blood—latent it may have been in the original—but when mixed with that of more plebian origin it finds its way into those thick-fleshed animals which "painstaking breeders" like to see.

English Short-Horn Sales for 1875.—We copy the following list from the *Mark Lane Express* and publish it as a guide to breeders in fixing upon the dates for the local sales: April 28, part of Col. Kingscote's herd at Kingscote, Wotten-under-Edge, Gloucestershire. April 29, part of Mr. Bowly's herd, at Siddington House, Cirencester. April 30, probably the whole of Mr. J. A. Mumford's herd, Chilton Park, Thame. August 25, the large portion of the Earl of Dunmore's herd, Dunmore, Stirling, N. B. September 2, the entire herd (about 100 head) of the late Mr. Torr, of Aylesby Manor, Grimsby, Lincolnshire. September 7, part of Lord Sidmersdale's herd, Lathom House, Ormskirk. Sept. 9, Short-horns belonging to Messrs. Foster and More, near Carlisle. September 10, part of Sir Wilfred Lawson's herd, Brayton, Carlisle. September 22, part of Mr. H. J. Sheldon's herd, Brailes House, Shipston-on-Stour. September 23, Mr. J. W. Philips' Short-horns, Heybridge, Cheadle, Staffordshire.

It has been decided by the stock-breeders of Connecticut to hold a Spring meeting as well as a Fall meeting this year. The premiums at the former will amount to $12,000, and at the latter about $10,000.

Dust for the Animals.

A writer in the *Country Gentleman* thus "goes for" the advocates of combing and currying:

I do not advocate dirty surroundings, but merely deny there is any benefit in grooming young or breeding stock generally, and maintain that if sheltered by night and allowed to roam about by day, then evil instead of good arises; for I never knew an instance of lice hurting well-fed and healthy young stock when suffered to go out and about daily, whereas, in many instances I have seen colts and calves which have been curried and brushed, that have swarmed with vermin, and the owner has been obliged to dress with poison to get rid of them.

Sand and dust rubbed into a lonsy animal's coat will, by a few applications, cause lice to disappear, for the animal will shake itself and they will fly out with the dust, the same as fleas, etc., are shaken out of a hen's feathers after she has dusted herself in soil or ashes. See, too, how horses and mules will roll every opportunity, and by turning over on their backs, try all they can to have some dust on every part of the body, thus proving beyond any question that some dust is gratifying to the feelings of the animals. Yes, let any gentleman have any or all of his nags, draught horses or mules cleaned to look their very best, and then turn them out of doors without halter upon them, and if every one of them does not lie down and roll in the most dusty place convenient, I will forfeit my reputation as a judge of what is good for live stock.

Flax Culture.

Flax is a very quick crop—the producer can receive his money within four months from the time of sowing the seed. If seed alone is wanted, the best yield can be obtained from dry, rolling, moderately rich land. If straw is wanted, choose, moist, rich land, such as our creek and river bottoms. The land should be clean from weeds. On dirty land, the expense of raising and harvesting the crop will be more than doubled. The soil must be put in the finest possible condition, and be made smooth and mellow before the flax is sown. The seed should be covered with a brush harrow or roller, as, if covered too deep it will not come well. A heavy rain immediately after sowing will cover the seed sufficiently, provided the soil be very fine and mellow. Great care should be taken to procure seed of good quality. It should be fully matured, plump and glossy, and free from foul seeds. If good seed is desired, sow from sixteen to twenty quarts to the acre. If sown two thick the heads will be smaller and not so well filled with seed.

Flax should be cut as soon as the bolls begin to turn brown; as, if left standing too long, there will be a great loss of seed in harvesting. It may be cut with almost any reaper, and if raised principally for seed, there is no necessity for binding it, but it may be left in gavels until dry, when it is ready for threshing. It is better to thresh early. For threshing, some use a flail; others tramp out the seed with horses; while others use the common threshing machines, with some slight alterations. The average yield is from twelve to fifteen bushels per acre.—*Ex.*

Poultry Yard.

Fowls---The Kind to Keep.

My "fancy for chickens," writes a correspondent to the *Country Gentleman*, dates from my boyhood, and since then I have been a close observer of their habits, and during the past ten years have had opportunity to test, by actual experiment, my long-conceived notions of the important place they hold among the productive elements of the farm. Experience has convinced me that there is scarcely any interest of the farm that will pay so large a return on the investment and labor bestowed upon it as will the keeping of the domestic fowl in flocks of 25 to 200, the number within these limits depending upon the accommodations, extent of territory, and care devoted to them; and, farther, that the egg-producing department of the poultry yard is that in which lies the greater profit. There is an undoubted profit in breeding them for the spit, but so much more in keeping them for the production of eggs, that I consider the former object secondary to the latter. Please accept the statement of the fact that the past five years' management of a flock averaging 175 shows an annual profit of $350 from eggs alone. Assuming the proposition that they will pay largely, it behooves us to consider the merits of different breeds, and discover, if possible, the best variety for laying. Under this head I propose to give you a leaf from my diary.

Some ten years since, I bought with my small farm the poultry on it, about fifty head of common fowls; at the same time, I procured from another source a trio of Black Spanish fowls, from which I reared, during the season, about twenty pullets. The change from city to country life gave a keen relish to everything fresh and rural, and we "fared sumptuously" every morning on the fresh laid eggs; but with the fall of the leaf our short-lived pride of the table soon came to grief. Three eggs a day! What a beggarly show! Wheat screenings, table scraps, sheep's plucks and oyster shells in vain wooed dame Partlett to fecundity; but with the December days, a gradual increase in the yield was developed. The combs of my Spanish beauties, "mantling high" with the red emblem of maturity, blazoned forth the secret of the change, and a bountiful supply of fresh laid eggs once more graced our table. Selected only as handsome specimens of the feathered tribe, the great superiority of the Spanish as layers was not at first suspected; but I immediately began my experiments, and in the following Spring I found that six Spanish hens, kept apart to secure purity of eggs for hatching purposes, gave an average of three eggs each in four days for the space of six weeks—while the common fowls, under similar circumstances, laid only every other day.

In my judgment the best three varieties of layers known to us are the Leghorns, Spanish and Hamburgs, and first of all I place the Leghorns. The eggs of the Hamburgs are too small, while the Leghorns lay a large, plump egg, and they mature much earlier than the Spanish. Chickens hatched in the Spring will mature and commence laying earlier in the ensuing Fall than the Spanish, and this is a great consideration, since it is on these Spring pullets that we must rely for our Fall and Winter supply of eggs. I believe the Leghorns will lay the heaviest weight of eggs in the year of all breeds in proportion to their size and food consumed, while the Brahmas, will produce the lightest with like relation to size and food consumed. There is a difference in the laying qualities of fowls of the same variety, and I have noticed that those with the largest combs and wattles, or great predominance of the "red" in the face and about the head are invariably the best layers.

Ducks.—A farmer's boy writes us from East Rindge saying that he has a pair of ducks, and asking how he shall take care of them so as to make the most of them.

About a year ago we published what we knew about ducks, but as this seems to have escaped the attention of our young friend, we don't mind repeating some of it. In the first place then, you want to remember all the time that the duck is a great feeder. He is not very particular as to what he eats, but he wants a great deal, and when he has it, grows very rapidly and keeps fat all the time. This Winter your ducks will eat almost anything which you can give them from the table, crusts of bread, potato peeling, old turnips, bits of meat, and "swill" generally, besides grain. Next Summer they will catch and eat an innumerable number of bugs, worms, snails and insects of all kinds, and this is one great reason why we like ducks; they also relish fish, frogs and tadpoles, but are not grass eaters like geese. This Winter you want to keep them where they can have a warm place to sit nights and a chance to waddle around in the sun days. A tub of water to which they can have access will furnish them all the water they need, and some kinds will get along well without even that. We would not shut them in a small pen as it would soon become nasty and foul.

They probably will not lay next Winter, but by April they should commence and lay an egg every day until Fall. They are apt to drop their eggs anywhere they happen to be, but if encouraged to go to the barn for feed, and if furnished a good place, can generally be made to lay there.

They are poor hatchers, careless of their business when first hatched. We would therefore take their eggs and set them under hens. The eggs hatch in 31 days and they require no attention but what the hen will give them. When once the hen is sitting leave her alone. When once the ducklings hatch, feed them with boiled eggs and flour, and crumbs of bread soaked in sour milk, for a few days, and after that give them boiled meal, boiled potatoes, cooked bran and any bugs or angle worms you can find. For the first week or ten days, or longer if the weather is not fine, keep them confined in pens where they can only get at water enough to drink. If they are let loose they take to the water and get cold and die. More ducklings are killed by going too early into the water than any other way. For this reason do not let them out when the grass is wet. After they are three weeks or two months old, they may be let loose to forage in the garden or field, but they should be brought home every night. Do not give them raw food except bugs and worms. Ducks need water in the Summer, but will do nicely without a great deal. As we have said, when well fed they grow rapidly, and are ready for market early. *Mirror and Farmer.*

Curd, made by scalding milk to separate the whey, is as good feed for young ducks as can be procured.

Selection of Turkeys for Breeders. What I have to say will be addressed more to farmers than fanciers. It is to be supposed that fanciers know enough to keep the best, while most farmers (in this vicinity, at least) sell the largest and best, and keep over a little late turkey that will not sell.

I think the bronze is the best breed. They are very hardy, grow to a large size, and have splendid plumage. The selection in breeding stock is of the utmost importance. I would not keep over a young gobbler weighing (at six months) less than 18 pounds—20 or 25 pounds would be better—and the hen to weigh at least 12 pounds at the same age. A gobbler weighing 20 pounds at that age, is cheaper at $10 than one weighing but 12 or 14 pounds would be if given to him.

I remember the first Bronze gobbler I bought cost me $7.75. He then weighed 18¾ pounds. I felt rather cheap about it, but it was the best investment I ever made in poultry. The December after he was one year old he weighed 35 pounds, and he now weighs 40 pounds. I would select a gobbler that was broad across the back, short legged, and square built. A tall, stilty, thin-built bird is not worth keeping—always remembering that a young Bronze is comparatively tall.

The hen should be short legged, square built and long bodied. I have read of young hens weighing 18 or 20 pounds, but have never seen them. If any one has any such hen to sell, at any price, I should be glad to hear from him. It is just as much trouble to get a turkey old enough to take care of itself that will weigh but 6 or 7 pounds, as it is one that will weigh from 12 to 20 pounds. Another thing, most farmers kill the old birds in the Fall. Now, I consider old birds worth double (for breeders) the price of young ones. If I had an old hen that took care of the young turkeys, was all right otherwise, I would keep her until she was at least five years old. And a gobbler that proved a good bird at maturity, I would keep as long. The young turkeys will be larger and stronger when hatched, and are easier to raise.—*Ex.*

The Best Poultry for General Use.—In answer to this question, a correspondent of the *Poultry World* says he has arrived at the conclusion that the Brahmas, all things considered, are the best for general purposes, for the following reasons:

I have found them the best Winter layers if started early in the season; this is the time of the year when eggs are in the greatest demand, and the price then realized is fully double, for ordinary family consumption. I find that it costs but little more to keep them in Winter than in the Summer season; and for limited premises, where fowls cannot enjoy a good range, the excess in any portion of the year varies but slightly.

Good care under all circumstances, and at all times, is a prime necessity to success in breeding fowls. These larger birds need no better treatment than do the smaller varieties. At an early age, the cocks are ready to kill, and they average much larger chickens for market uses, at a time when dead poultry brings the best price in the cities, than do small breeds.

As mothers, the Brahma hens cannot be excelled. The chickens are hardy, and make a fine table fowl if properly fed and strictly cared for from the shell; and, when in good condition, in the early Fall, they will dress from ten to twelve pounds a pair (often heavier), which is almost twice the dead weight of average marketable chicks, now-a-days, of the common varieties. This extra weight will far more than compensate for the extra cost of good care and keeping; and the Brahmas may be limited to narrow confinement, by enclosure with a four-post high fence, which is a consideration of consequence in many locations.

Crossing Breeds.—I have a flock of twenty-four hens, a cross mostly of White Leghorn and the Light Brahma. They have laid fairly during the past Winter, but in three days of the last week in February they laid respectively fifteen, twenty, and twenty-one eggs. Can any one tell me of so large a yield of eggs from this cross thus far? The produce is hardy, of good size, and fuller in the breast that the pure Brahmas, and almost as broad on the back and in the rump. The legs are nearly free from feathers, which is a great improvement to my eye, and they are not such inveterate setters as I find the Brahmas. In fact, some do not want to sit at all, and others that do can be broken up in three or four days, instead of as many weeks, as it has often taken me with pure Brahmas, and I have tried every method for this purpose I ever heard of. This cross-breed of hens has proved superior to my Houdans in laying the past winter.—*A. B. Allen, in Country Gentleman.*

Remedies for Hen Lice.—As the Summer heats increase hen lice multiply and the broods need constant looking after. It is a safeguard to put tobacco in the nests of sting hens. Refuse tobacco or old stems will answer the purpose. If lice are already in the hennery make a strong decoction of tobacco and apply it with a syringe all over the inner surface. Sulphur sprinkled in the nests and about the roosts is also a good remedy. Insects do not like the smell of brimstone. Another remedy much used recently and very easily applied is kerosene oil. Strips of listing from the tailor's shop are tacked upon the roosting poles, and these are saturated with the oil. The hens upon the poles get some of this oil upon their feathers, and wherever it touches it drives off the insects or kills them. Carbolic acid is a cheap destroyer of insect life. It is largely diluted with water and applied to all parts of the house. If, in very old houses, one application is not sufficient, repeat it.—*X.*

A lime wash, made of tobacco juice and lime, is also good to drive away lice from buildings and roosts.

Porcine.

More Hogs and Less Wheat.

A Minnesota farmer writes the *Farmers' Union* some hard sense under this head, and had it been written for Cahfornia farmers it could not have been worded much better. Read it, and consider well the facts.

Why *don't* we raise pork? I cannot tell, unless it be that the goddess Ceres has so fascinated and blinded us by her charms that wheat, and wheat only could we sow and reap on our virgin soil. But the goddess suffers a terrible eclipse this year, and let us quietly break from her leading strings and discuss the *pros* and *cons* of raising swine for profit after the example of our thrifty neighbors.

It must be admitted the price of pork fluctuates greatly, but none can doubt it will bear a good price for two or three years. Besides we should at least supply our *own* rapidly increasing wants at all times. It is a burning disgrace to us farmers that we have to import pork, bacon and lard. We belive, on the contrary, that it would be a wise and prudent policy for our own farmers to go into the business largely, and export this product by millions of dollars annually. The large and increasing export to Europe will keep up a fair market, and we can ship pork, bacon and lard much cheaper than wheat. But let us pass to the next question—

HOW SHALL WE RAISE THEM?

First, how *not* to do it. Don't attempt to hang up high hopes and expectations on the big-boned, long-legged, lean, slab-sided, two-forty racers; or even the common scrubs of slow growth, but ravenous, all-devouring eaters. Don't keep only the breeding hogs over Winter. Don't freeze them by cold, wet, unlittered pens, and don't starve them with wish-washy, homeopathic doses.

Commence with the best well-bred grade of pigs you can easily find of any of the early maturing breeds. These are so widely diffused there is no excuse for keeping inferior ones. Breed to a thoroughbred male of the most hardy and early maturing blood—we would choose Berkshires, and be sure you are not deceived by men who will sell grades for pure breds. The young pigs should be dropped in March or early in April, and give them, without fail, a well-littered, warm pen. Give them the best start in life you can. They will pay you richly for care and good feed. Have a clover lot in early Summer to turn them in. In August turn them into the corn (grain) field, fencing off a small area by a hurdle fence. After harvesting this lot move the fence round another lot, unless you choose to follow up with the store hogs. Keep changing as necessary your hurdle fence, and watch the porkers grow fat. You may give the finishing touch to them in your pens if you keep into December. Kill, cut, barrel, smoke and try out the product *yourself*, and learn to do it well. You then reap the whole harvest, and save the middlemen's profit.

Two hundred and fifty or seventy-five pounds of the sweetest, nicest quality, turned when eight or nine months old, will swell out the pocket book to a greater rotundity than wheat or beef—and think of the little labor and expense. Try it, farmers. But, remember, the keystone of success is the use of a *pure-bred male* of one of the improved breeds, and *generous care and feeding.*

Improvement in Breeding Swine.—At all our fairs, at all our markets, and upon the premises of all good farmers, we see the most surprising evidence of improvement in our stock of hogs. Pure blood has, within the last twenty or thirty years, done more to improve our swine than any other class of domestic animals. Several reasons may be assigned for this: In the first place, the breeding of pigs is an easier and more simple matter than the breeding of horses or cattle, or even sheep. We breed here for flesh and fat only; and owing to the extraordinary fecundity of the species we may modify the characteristics of a variety in a comparatively short period. In the next place, as hogs make no other return for their keeping than that derived from their carcass when slaughtered, the importance of the best form and quality for the production of the most profitable carcass, is more manifest and pressing here than with any other species. It requires very little intelligence to discover that to produce pork, bacon and lard profitably, we must have a variety of pigs that can be brought to their average maximum weight at from ten to fifteen months old—experience has demonstrated that it will not pay to keep them longer. For this purpose we must have a round, straight carcass on short legs. Medium sizes are better than very large ones, more economical, and produce better pork, selling usually for the best prices.

The farmers of America are entitled to great credit for sagacity in resorting to superior blood for the improvement of their swine; and when we reflect how extending and widespread has been the benefit, and how self-evident its great value, we wonder that the same judicious practice has not been resorted to in the improvement of other stock. As we have said, the beneficial results are more immediate here, and secured at less expense than where pure blood is resorted to for the improvement of cattle; but the necessity is not greater in the one case than the other, though it is more obvious.

For twenty-five to fifty dollars we may secure the best thoroughbred boar, and if he has work enough to do he will more than pay for himself the first season. For one hundred and fifty to three hundred dollars a good thoroughbred bull may be had; and he, too, may be made to pay for himself in a single season. While the keeping of inferior cattle does not, to an unobserving farmer, appear so self-evidently unprofitable as the keeping of scrub pigs, the loss is, nevertheless, greater, as the rearing and keeping of cattle involves so much more expense.—*Cor. National Live Stock Journal.*

Dressing Black Hogs.—If care is taken in scalding black hogs they can be dressed as white as any white hog. It is a well known principle that all black substances absorb heat. Hence in dressing black hogs the water should not be so hot as in scalding white ones. If this simple rule be observed, there will be no difficulty in dressing black hogs. Instead of this color being an objection, I consider it as an advantage, for the skin of a black hog will always be found to be smooth and glossy, free from cutaneous eruptions and always clean.

The Berkshire Pig.—The old Berkshire hog was held in very high esteem for many years, centuries perhaps. It was regarded as the best pig in England, and was naturally selected as the basis of the wonderful improvements which have built up the reputation of the modern Berkshire on such a basis of intrinsic good qualities. It is, no doubt, true that much of the improvement is due to the Chinese cross.

Sidney, a popular English writer on swine, says: "Among the black breeds, by universal consent, the improved Berkshire hog stands at the head of the list, either to breed pure or to cross with inferior breeds. The Berkshire was originally a large breed of a black and white and spotted sandy color. The 'late' Lord Barrington, who died in 1829, did a great deal towards improving the Berkshire breed, and the improved Berkshires are almost all traced back to his herd. They are now considered by Berkshire farmers to be divided into middle and a small breed. If first class they should be covered with long black silky hair, so soft that the problem of 'making a silk purse out of a sow's ear' might be solved with a prize Berkshire. The white should be confined to 'four white feet, a white spot between the eyes, and a few white hairs behind each shoulder.'"

The Berkshire, now so far improved of itself, has been extensively used to give size and constitution to other breeds, to the Essex, etc. It must be regarded as a great and desirable acquisition to our American swine, and we are glad to see so many fine specimens at our fall cattle shows.—*Mass. Ploughman.*

Money in Hogs.—We have repeated that there was money in pork if farmers would raise good stock hogs and take advantage of the improved breeds introduced into our State. We are furnished with proof of this as follows: Mr. Joseph Oppenheimer, of Colville, Oregon, two years ago purchafed a good Berkshire boar pig of S. G. Reed, for the purpose improving his stock of hogs. He recently killed twenty graded hogs 18 months old and their average weight, dressed, was 366 pounds—two of them weighing respectively 470 and and 478 pounds. Who can doubt, then, that it will pay to improve our breed of hogs? It is a great mistake to suppose that hogs can only be fattened with wheat. Every farmer should have a boiler conveniently fixed to cook hog feed, and then he could utilize all his root crops, boil potatoes, squashes, apples, etc., add a little chopped wheat to strengthen the diet, and so insure hogs well and cheaply fattened. There is no better opening for a sure thing in connection with farming than for every farmer to raise at least twenty hogs and fatten thus each year. We even assert that he would not lose money on them if he had to feed them wheat worth a dollar a bushel. But the first thing to do is to improve the stock of animals.—*Willamette Farmer.*

Wheat or Corn as Feed for Hogs.—A correspondent of the Kansas *Farmer* says a large hog feeder, in Illinois, informs him that he has produced eleven pounds of pork from a bushel of corn, and seventeen pounds from a bushel of wheat. He grinds the wheat, pours boiling water over it and allows it to stand some hours.

The Most Nutritious Food.

The following, according to the celebrated Dr. J. C. Beck, shows the amount in pounds nourishment contained in a hundred pounds each of the article of food as stated below:

Corn, 97 lbs; peas, 93; beans, 90; rice, 90; wheat, 85; barley, 83; rye, 80; bread, 80; meat 35; beets, 18; carrots, 14; turnips and greens, about 8.

See how many of the family can remember and give the per cent. in the order as above.

Sheep and Goats.

What Breed is Best?

THE best breed of sheep for any given climate and kind of pasturage is a question that is worthy of some discussion, as wide difference of opinion prevails among sheep men. The breeders of each variety seem to think their favorites the right ones always. But the experience of those who are engaged in the business for profit is probably the most conclusive, especially when the business is intelligently conducted with a single eye to success.

It has been demonstrated that the Mexican sheep, graded with Merino, produces too short a staple of wool, when sheared twice a year, to bring a remunerative price. And, as there are two seasons of short feed, and the wool is consequently weakened thereby, it is necessary to shear twice to avoid the weak place in the fleece which would render it worthless for fulling. If our sheep men could so contrive as to feed their sheep in the Fall, and prevent the "break in the wool," it would be best, undoubtedly. But there are large sheep ranges that are now occupied in such a manner that the saving of feed for them is not deemed practicable. Shearing them twice a year is the settled custom, and a breed of sheep that will grow a longer fleece than the pure Merino, or Merino mixed with the common sheep, is needed for open ranges.

Some of our experienced breeders are now mixing the Cotswold with the Merino to give length to the wool, and they find it a good thing to do. The Cotswold not only gives a greater length to the wool, but also gives a heavier carcass, making the weathers much more profitable as mutton sheep. By selecting the finest sheep for breeders, and carefully crossing a few times, until a uniform texture of wool can be obtained throughout the herd, it is found that one-fourth to one-half Cotswold with Merino produces the required length, without giving coarseness enough to materially lessen the value of the fleece. The experience of McCracken & Lewis, of San Jose, who own several flocks of sheep, and who have been experimenting for some years in this direction, is, so far, conclusive of the superior value of the cross of the Cotswold with the Merino and common sheep over the cross of the Merino and common sheep alone, as generally bred. Our climate and sheep ranges are peculiar, and it needs a good deal of experience to discover the best exact crosses for greatest profit where sheep must depend entirely on pasturage for subsistence.

But when farmers generally find it profitable to keep a small flock of sheep upon their farms, (as they surely will, in time, in California) it will probably be found best to keep the sheep in good condition the year round and shear once a year. Then either the long wool and heavy carcass or the very fine wool sheep will be found best in their purity, as there will always be a demand for the finest staples at high figures, and also for the long, strong combing wools at good prices.

But, until the time comes when it will no longer be profitable to occupy large uncultivated ranges with sheep, of course, it is a matter of a good deal of concern to such large sheep owners to get the best breeds and crosses to suit their purposes.

THE MERINO.—This is what a writer in an Eastern paper says in favor of the Merino sheep:

For wool growing, the Merino has no equal, and the mutton standpoint is not so objectionable as some would have us believe, either in quality or quantity.

Where the proper breeding has been given to produce heavy carcasses, the Merino has and always will produce more mutton to the acre than any other breed. It is the poor man's breed, for they will live and do well on less food than any other breed.

For the production of fancy wool, the Southdown, and perhaps all the Downs are to be classed under this head, so far as quality of mutton goes. Some of the Downs are better for wool than the famous Southdowns. Those above, kept up to the standard of breeding and feeding, are very profitable, and are unquestionably the most fancy looking sheep in a flock of from twenty to thirty-five.

The combining of wool and mutton is met exactly in the Cotswolds, Leicesters and Lincolns. Their large, heavy carcasses covered with long, lustrous wool, seem the very embodiment of sheep perfection. These, like the Downs, required and demand rich pastures and abundant food. Their breeding qualities are not so good as the Downs, and seldom do well in flocks of any size—say from twenty-five to fifty, is as many as are profitable to keep in one flock. Their mutton is too fat for the American taste, but their early maturity and great size will continue to make them popular, especially while the demand for combing wool lasts. There is no reason to suspect any decline, either on their mutton or wool. Their adaptation to bad treatment and poor pastures, or hilly pastures, will forbid them ever becoming what is required of them, by the careless or common shepherd.

SALT AND CHARCOAL FOR SHEEP.—The use of charcoal as well as salt has been highly recommended for cattle, as tending to keep them in good condition and help their general improvement. Salt acts healthily on the blood. Charcoal strengthens and heals the mucus membrane throughout the alimentary canal, and increases the power of the digestive organs, healing any unhealthy condition existing there. It prevents worms generating in the stomach, etc; it absorbs the putrescent gas by which worms are generated, and they subsequently die. The free use of charcoal and salt will contribute to protect cattle from epidemics, and will counteract the effects of putrescent or septic water. Many farmers have, doubtless, noticed that cattle and sheep are remarkably healthy when running among the charred stumps and logs recently burned off fields. We have known a flock of sheep, poor in flesh, to improve to that extent, when permitted to run among charred logs for a few weeks, that they would bring double their former value. The good effect is not perhaps so marked with cattle, but is always advantageous to the health and prosperity of the animal.

HE THINKS SHEEP PAY BEST.—In "Some Sheep Talk," in the *National Live Stock Journal*, an experienced stock keeper says:

I have been feeding some three hundred head of cattle, and I am satisfied that even with the most favorable conditions for selling when the time comes, I shall make a great deal more money, dollar for dollar, on the money I invested in sheep than I shall make on the capital invested in cattle. I have about six hundred sheep, running without any particular attention or care, and have sold one thousand four hundred dollars' worth of wool of this year's clip, and have two hundred and fifty lambs besides. I do not think it possible to have done so well on an equal amount of capital invested in cattle. One great advantage sheep have over other stock is, they never die of the contagious diseases which they contract. They get the scab or foot rot, or something else, and if unchecked it gets them in bad condition, and would ultimately, perhaps, kill them. But the very worst contagious disease to which sheep are subject give the owner ample time to treat the affected animals, and the diseases are generally of a character which yield readily to treatment.

A COMPARISON OF SHEEP.—A sheep breeder says: All farmers should know the most profitable breed of sheep, and they will never know except as I have learned—by experience.

The Merino is a small breed and makes a small turn-out of wool but a large quality of grease and dirt, which is very bad for the buyer. If exposed to the weather, as sheep generally are, they are short lived; their lambs are delicate and much trouble to raise.

The Southdown is a much hardier sheep, and better for wool or mutton than the Merino; will shear more wool and not so much grease and dirt; has a heavy carcass and is superior as mutton.

The Cotswold is acknowledged by all knowing stock men to be the heaviest breed now known, sometimes weighing three to four hundred pounds. Their wool is from three to five times as long as the Southdown or Merino, and is called combing or delain, and is more sought after than any other kind. They are very prolific, sometimes giving birth to three or four lambs, and most always two. I have weighed lambs three weeks old which weighed thirty to forty pounds. They stand the Winter as well if not better than any other breed. The Southdown is thought to be superior as a mutton sheep, but I have never been able to discover the difference when brought to the table. The cross of the two makes the Shropshiredown, a very fine sheep for all purposes.—*Southern Farmer.*

DRESSING SHEEP.—If you want good, sweet mutton, kill your sheep without worrying and fatigue, the less exercise the better. Hang him up by the hind legs and clean him at once. Now change ends, flaying him by the head, and skin down to the tail; the job is done in half the time, and done neatly. It is not the wool that gives mutton the sheepy taste and smell, it is the food during exercise and after being killed, hence the necessity of speedy work until cleaned. This much I have written for the young farmers, and expect some will try my plan, but the old farmers are like I am—have a way of their own, and will do it their way or die. Now, I hope some of these hard heads will tell what they know about sheep, too. –*Ex.*

Extensive Use of the "Weed."

The Americans are a nation of tobacco chewers and smokers, though not so much as some others given to the use of snuff. The statistics of traffic in the "weed" are interesting. They show that during the last fiscal year we exported 318,097,804 pounds, valued at $130,399,181, and imported 10,000,000 pounds of leaf and stem, valued at $5,332,-548 41, and 845,744 pound of cigars, or, in round numbers 76,888,000 cigars, worth $3,-038,628. In the same time, from foreign and domestic material, we manufactured 1,780,-961,000 cigars. The average daily consumption is placed at 5,168,000, and the revenue realized by Government was $39,392,936.

PETERSHAM has produced an auctioneer who tells the truth. He recently told a bidder, "You've got a good bargain on that sleigh you bid off for $2 50. It is just as good for the hens to roost on as one that costs $60.

Apiary.

The Inmates of the Hives.

IN order for a colony of bees to maintain an existeuce (other conditions being favorable), it is necessary for the hive to contain three kinds of bees: 1. The workers, which are undeveloped females, are those bees that perform all the labor of the hive. They elaborate the wax, build the comb, provide for and nurse the young, gather the honey, collect the pollen, and defend and protect the hive. The life of a worker bee, during the busy season, is very short—not over 80 days—60 days may be an average. In seasons of inactivity—as when torpid from cold—they live much longer. 2. The queen bee is the mother of the colony. She is sometimes called "the king" by the ignorant. There is only one to each hive. The term "queen" leads many persons to suppose that she rules the hive like a sovereign with a royal scepter. Such is not the case. It is true she has a queenly look, but her office is only to lay eggs that are to hatch and develop into young bees. After she deposits the egg, she cares no more for it, but leaves it entirely to be provided for by the workers. It is very important for the bee keeper to be familiar with the appearance of the mother bee, so that she can be readily distinguished and found when necessary. The abdomen of the queen is much longer than that of a worker, and is also free from hairs. The wings look shorter, while the legs are longer and have no baskets for carrying pollen. The black queen resembles a black wasp more than a worker bee. As she runs rapidly when scared, and seeks a place to hide, the novice often has great difficulty in finding her. When you wish to look for her, disturb the bees as little as possible, and commence to look carefully on the second or third frame from the outside. Look in the corners and around the sides of the frame. Examine closely each frame. If she is not to be found on the frames of comb, and has not been overlooked, then she is on the sides or bottom of the hive. Sometimes it may be necessary to remove all the frames, and shake the bees on a sheet in front of the entrance, and then look out for the queen as she goes in. After the eyes once get familiar with her appearance, very little trouble will ever be experienced in finding her. Italian queens are very readily distinguished by their bright color and quiet habits. On removing from the hive the card of comb containing the Italian queen, she seldom ever runs like the black one, but often proceeds with her operation of laying as though she were in the hive. Queens usually live about three years; and are said never to leave the hive except to meet the drone or to lead out a swarm. When once fertilized, the operation is for life. Queens are often superseded. As soon as the vigor of a queen becomes impaired, the workers, in seeming anticipation of her barrenness or death, proceed to make preparations to rear another mother for the colony. After selecting the egg or young larva, they proceed to enlarge the cell around it, and to deposit a great mass of a whitish gelatinous substance around the young grub, called royal jelly, which is the food that nourishes, develops and transforms the larva that would otherwise be a common worker into a princess. How this royal jelly accomplishes this wonderful transformation is a great puzzle with apiarians. Many untenable theories have been advanced to account for it, but no doubt the bees will keep the true secret to themselves for some time to come. In about six or seven days from the time the cell is started the bees seal it over. It now has some little resemblance to a ground pea. On an average, the young queen will hatch in about twelve days from the start of the cell. In from five to ten days she will go out to meet the drone, and in a few days more she will be laying. This field of apistical science affords great room for thought and observation.

3. The drones are the male bees. They are large, lusty looking fellows, and make a loud, coarse sound when on the wing. Their mission is to fertilize the young queens. When this is accomplished, the workers have no further use for them; and as they are non-producers from necessity, not having the requisite organs, and having no sting or means of defense, they are unceremoniously ejected from the hive or killed, when the honey or pasturage begins to fail. They are retained much longer in strong colonies than in weak ones. When one colony keeps its drones long after the rest have destroyed theirs, it argues, in all probability, that it has no queen, and needs attention.

The bees that Sampson found in the lion's carcass no doubt built their comb to the skeleton ribs in the same geological forms that bees of the present day build theirs. This may be instinct, the same that characterizes many of their other operations; but I have never yet found the economy of the hive to be governed by invariable law. Many of their actions and operations seem to be actuated by a higher instinct, bordering on the principle of cause and effect. Who of us is always capable of drawing the exact line of demarkation between instinct and reason?—*J. P. H. Brown, in Our Home Journal.*

SHADE FOR BEES.—My observation and reasoning have led me to the conclusion that shade is an advantage, and a decided one, to bees. I do not mean a dense shade, but one partially relieved by sunshine, such as bees left to themselves would and do naturally select—in the tops or upper part of trees, in a forest, seldom if ever the lower, humid part of the wood. Why is this? Evidently because bees require a temperate condition of the atmosphere, neither too cold nor too warm, too damp or too dry, too light or too dark. These three conditions are of importance, and it should be the business of the bee keeper to aim at securing them. I presume no one will pretend that they are a disadvantage; that an excessively hot or an extremely cold season is a favorable one; that bees will do well in a season of severe drouth or great humidity, or with little sunshine to enliven them. The point is not alone the abundance of honey to be collected, but the condition and inclination of the bees to gather it. Bees prefer to be undisturbed; require harmony in the hive, and a favorable condition of the atmosphere. There are many other things that have an influence on bees, so that we see that it is not alone good pasturage that is required. However much honey there is to be gathered, on a wet day little is done. The same is the case with an extreme of cold, and to a certain extent with excessive heat; but not so much with the latter, as bees on the wing or in collecting honey, feel less the solar influence. This brings me back to my point, the locality, the habitation of the bees, which is different from its range. The one has air, freedom; the other combines heat, if the hive is placed in the sun, and especially on a southern inclination with the wind warded off. Such a situation I have found generally to be unfavorable. I say generally, as there are cool and otherwise favorable seasons that are exceptions, in which colonies so situated have done well.

But how can the favorable atmospheric conditions be secured? Nothing is easier. An orchard or a grove will do it. It needs only part shade, part sunshine. This tempers the rays of the sun, and secures the necessary moisture in a drouth, and also leaves a chance for the escape of an excess of humidity. There is a protection, and the encouragement which bees seem to derive from the presence of trees—perhaps from their long habit of association with them. Here there is no melting heat concentrated on the hive. It is comparitively cool inside and pleasant without. The best success I have ever known with bees has been in orchards and shaded doorways, unless I except a few cases in the woods, where wild swarms turned out the most honey. Now there are some seasons in which the exposed hives will do as well as those protected by trees, and even better sometimes—when there is a lack of sun, for instance. But take the seasons on an average, and the difference is decidedly in favor of protection. I am persuaded that an elevated range is, on the whole, better than a low place or valley. —*Country Gentleman.*

BEES, WASPS AND GRAPES.—Some persons imagine that the bees injure fruits, and especially grapes. They are greatly in error. It is useless to insist on the part taken by bees and hornets in the prejudice done to our vineyards. First let us consult the books. I do not find a single book on agriculture, horticulture, fruit or grape culture, that does not cite the wasp among noxious insects that should be fought incessantly and mercilessly; while not a single book mentions as such the industrious honey bee, whose vindicator I now am.

The wasp pierces the fruits; to the grapes it leaves nothing but the skin and the seeds. The bee only profits by those spoils; for she usually goes from blossom to blossom, gathering honey in gardens and fields. If at times she is seen in orchards and vineyards, where she only goes after the wasps, it is only to gather the remains of the feast.

Curious experiments have been tried, it appears: Some sound fruits were placed simultaneously within the reach of both wasps and bees, the former have soon achieved the their work of destruction, while the latter starved to death.

Therefore bees do not eat grapes. So, it is with profound conviction that I say to those who wish, if not to prohibit, at least to render impossible the establishment of hives in the neighborhood of large cities, under the fallacious pretext that they destroy grapes. Respect the bee, since she respect our fruits; let her live in peace near us, she never will be ungrateful. Is she not the mysterious instrument that helps and facilitates the phenomenon of the fertilization of flowers, and perhaps produces those innumerable and beautiful varieties by carrying pollen from the calycle of one into that of another? Is she not the living image of work, and gives us the perfumed honey and the wax that we use so diversely?

Respect the hives, leave them where the industrious genius of man placed them, for they are a source of wealth for the roof that shelters them, and for the country that nourishes them.—*Bucher du Sud Ouest.*

ALWAYS feed your bees for two or three days after they have swarmed, be the weather fair or foul. They will repay your attention and your liberality with usury, before the season is over.

Human Nature in Checkers.

An aged couple were very fond of checkers, and played quite frequently. When he beat she lost her temper, and declared she wouldn't play again. It vexes him to have her act so, but he controls the irritation, and talks to her about it. He tells her how wrong it is for people at their age in life to be disturbed by such trifles, add shows her so clearly the folly of such a course, that she becomes ashamed of her weakness and returns to the game, and plays it so well that she beats him. Then he throws the checkers in one direction and kicks the board in another, and says he will never play with anybody who cheats so all-firedly, and stalks moodily to bed, and leaves her to pick up the things.

THE rate on fruit between Santa Clara and San Francisco the coming season, by rail, will be as follows: On berries, per chest, 25 cents; half chest, 12½ cents. Other kinds of fruit, shipped in boxes or otherwise, 15 cents per hundred weight.

The Dairy.

Treatment of Heifers.

THE longer the young cow with her first and second calf, can be made to hold out, the more surely will this habit be fixed upon her. Stop milking her four months before the next calf, and it will be difficult to make her hold out to within four or six weeks of the time of calving afterwards. Induce her, if possible, by moist and succulent food, and by careful milking, to hold out even up to the time of calving, if you desire to milk her so long, and this habit will be likely to be fixed upon her for life. But do not expect to obtain the full yield of a cow the first year after calving. Some of the very best cows are slow to develop their best qualities; and no cow reaches her prime till the age of five or six years.

And here we have a suggestion to make, of too great importance to be overlooked or disregarded, with reference to the time the young heifer should be allowed to come in. Suppose a heifer came in with her first calf in Winter, or cold weather, which prevents the distension of the tissues of the skin, and on dry food, such as she would generally have at that season, and which produces at best but little milk. The organs of secretion will have but a slight development, compared with what they otherwise would, and will adapt themselves to a small yield of milk. This will be likely to become a fixed habit which it will be exceedingly difficult to break up. Hence we somtimes find external signs and actual results contradictory.

The extreme importance of care and attention to these points cannot be over estimated. There is a constant tendency to dry up in milch cows; and it must be guarded against with special care, till the habit of yielding a large quantity, and yielding it long, becomes fixed in the young animal, when, with proper care, it may easily be kept up.

If gentle and mild treatment is observed and persevered in, the operation of milking appears to be one of pleasure to the animal, as it undoubtedly is; but if an opposite course is pursued—if, at every restless movement, caused, perhaps, by pressing a sore teat, the animal is harshly spoken to—she will be apt to learn to kick as a habit, and it will be difficult to overcome it ever afterwards.

With the exception of the policy of milking cows to the time of calving, which we believe to be bad for both calf and cow, the above from the *Massachusetts Ploughman* we consider sound advice on the subject.

MORE ABOUT CHEESE.—It is important, says the *Mass. Ploughman*, that rennet enough should be prepared at once for the whole season, in order to secure as great a uniformity in strength as possible. The object should be to produce a prompt, complete, and firm or compact coagulation of all the cheesy matter. To obtain a good quality of rennet that will effect this, the animal should be in perfect health, and the stomach should be emptied of its contents, salted and dried without any scraping or rinsing, and kept in a dry place for one year, when it is fit for use, but if it is allowed to accumulate dampness, it will lose its strength. In Cheshire, so celebrated for its superior cheese, the contents of the stomach are frequently salted by themselves, and after being a short time exposed to the air are fit for use; while the well known and highly esteemed Limburg cheese is mostly made with rennet prepared as in Ayrshire, the curd being left in the stomach, and both dried together. The general opinion is that rennet, as usually prepared, is not fit to use till nearly a year old.

Perhaps the plan of making a liquid rennet from new and fresh stomachs, and keeping it in bottles corked tight till wanted for use, would tend still further to secure this end.

TO PURIFY DAIRY UTENSILS.—Stand on end in a convenient place for use, an open-headed vessel of suitable dimensions for the size of the dairy, say from half a barrel to a hogshead. In this slack some good quick lime, enough to make thin whitewash when filled full of water, and cover to keep out dust and dirt. The lime will settle, leaving a saturated solution of lime over it, as clear as spring water. After using the milk pans, etc., wash them as other utensils are washed and rinsed; then dip them in the adjoining cask of clear water, giving them a quick turn, so that every part becomes immersed therein; set them to drain and dry, and the purification is complete without any scalding process, from the new pan to the old worn out one.

The lime in the clear water instantly neutralizes the acidity of the milk yet remaining in the crack or seams, etc., of the milk vessels, to destroy which the process of scalding has been performed.

In the case of a small dairy, or one cow, the clear water may, if preferred, be dipped out for the time being and poured gently back again, the lime purifying the water and keeping it good all Summer.

Boys and Girls.

Mud Pies.

FOUR little sun-bonnets, ruffled and neat,
Covering tangles of sunshiny hair;
Chubby pink fingers, that busily work;
What have you found that is beautiful there?
Toiling like elves in their shadowy-wrapt caves,
Lying so far down from sound and from sight
That no remembrance of daylight can break
O'er the dark calm of their morningless night.

Find you the diamond, red garnets and pearls,
Emerald, topazes, rubies and gold?
Find you the key at whose magical touch,
Gem laden chambers of earth will unfold?
What do your merry eyes see that is fair?
Is it the sky that drifts soft, amber light?
Is it the blossom of lily and rose?
Is it the lark that sings on her flight?

Is it the brown thrush whose musical strains
From the green hedges and thick-t-nooks thrill?
Is it the field, blossom-dotted and fresh?
Sparkling river or diadem hill?
No, your wise heads bend thoughtfully down,
O'er the soiled hand that so busily flies,
Holds not a thought of earth's beauty and joy—
Making and caring for only mud pies.

Queer little pies, sprinkled over with stones,
Crimson, and yellow, and speckled with blue;
Trace-worked with broken twigs, powdered with sand;
Soiled leaves and blossoms, yet wet with the dew;
Crimped, pinched and scalloped, indented with holes
Where little fingers pressed heavily down;
Bits of green mosses and delicate ferns,
Over these homely pies daintily strewn.

Ah! little children, not you alone
Gathering the grime, while the good and the true
Pull souls come up into heavenly light.
Tells of grand deeds that they grandly may do.
Others than you fill the earth day by day,
Working unconscious of glorified skies;
Blind to the beautiful, blind to the true,
That all-transfiguring over them lies.

What the Baby Saw In the Class.

Mamma had gone and Aunty held him before the mirror to quiet his cries. In an instant his face was radiant with smiles while the tears rapidly rolled out of sight. His hair, like rings of gold, clustered about his head glistening in the sunshine, and he was a picture to behold.

For full ten seconds gazed baby on his own reflected image with wide open eyes. Then, chancing to move his hand, he noticed the same movement in the baby in the glass. He glanced first at his own chubby fist, then at the reflected one, as if comparing them. Unable to comprehend the meaning of it all, he came back to himself and burst out crying anew, dealing Aunty a heavy blow with the little doubled-up fist, one eye all the while upon the other baby, who quite startled him by doing the very same thing. In a moment the cry was checked, infantile indignation was awakened and a blow was aimed at the head of baby in the mirror.

Here is a lesson for babies of an older growth, thought I. Seeing yourself as others see you is both profitable and instructive, since it teaches a larger charity for others.

NELL VAN.

BAD BOYS MAKE BAD MEN.—An aged sea captain, who had spent a long life upon the ocean, said to a lady, "On ship board I can tell in a very short time what any sailor was in his boyhood." It was because "the boy was father to the man." He added, "I find invariably that a bad boy makes a bad man." When he saw a reckless, profane, vicious "son of the deep," he at once concluded that he was little better when a lad. Now this is just what might be expected. It is just what is seen in other things. Poor wool or cotton makes poor cloth. Poor cloth makes a poor coat. Poor farms produce poor crops. Poor timber makes a poor house. And so wicked children make wicked men and women.

It is said that the Emperor Nero of Rome, when a little boy, delighted to torture and kill flies, and would pursue the little creatures hour after hour to pierce them and see them flutter and die in agony. As he grew older he exhibited the same cruel disposition towards men. When made emperor he advanced in cruelty at a fearful rate; killed his own wife and ordered his mother to be assassinated. Nor was this all. He finally ordered the city to be set on fire, just to see how it would look. And when it was burning, he seated himself on a high tower and played upon his lyre. Was this strange? Is not a cruel boy likely to become a cruel man? Killing men in manhood is only a further development of killing flies in childhood.

TO BOYS AND YOUNG MEN.—You are the architects of your own fortunes. Rely upon your own strength of body and soul. Take for your motto self-reliance, honesty and industry, for your star faith, perseverance and pluck, and inscribe in your banner, "Be just and fear not." Don't take too much advice; keep at the helm, and steer your ship. Strike out. Think well of yourself. Fire above the mark you intend to hit. Assume your position. Don't practice excessive humility; you can't get above your level—water don't run up hill—put potatoes in a cart over a rough road and the small potatoes will go to the bottom. Energy, invincible determination, with a right motive, are the levers that rule the world. The great art of commanding is to take a fair share of the work. Civility costs nothing and buys everything. Don't drink; don't smoke; don't swear; don't gamble; don't steal; don't deceive; don't tattle. Be polite; be generous; be kind. Study hard; play hard. Be in earnest. Be self-reliant. Read good books. Love your fellowmen as yourself; love your God; love your country, and obey the laws; love truth; love virtue. Always do what your conscience tells you to be a duty, and leave the consequence with God.

ABOUT SO.—The habit of taking strong drink is like a river. An occasional glass is of little account, men say, and they take it. Then they drink oftener. The river grows broader and swifter, but they do not think of this. They drink yet oftener, and after awhile the little stream of habit has grown to be a wide, roaring torrent, and a little farther on is death.

DEWDROPS at night are diamonds at morn; so the tears we weep here may be pearls in heaven.

THE *Scientific American* thinks that people with bad colds ought not to kiss babies, as diptheria might easily be imparted in that act.

Woman's Progress.

Business Suitable for Women.

TO THE EDS. AGRICULTURIST: In the *Popular Science Monthly* there appears an article from the able pen of Dr. Van De Warker on the subject of "Women in the Professions and Skilled Labor." The logical conclusions deduced from the sexual disability of women to compete with men in business pursuits denote great study as well as a thorough understanding of the subject. But we would ask how many of our tender, struggling sex are not compelled, day after day, to lay aside sexual incompatibility in order to put bread into the mouths of children and clothes upon their backs? Is the wash-tub better fitted to woman's delicate organization than mental pursuits? Can she more easily attend to a house full of boarders, often doing the entire cooking for them, than to act in the capacity of physician, or attend to various kinds of skilled labor requiring less outlay of vital force? Would not our women of to-day be far healthier if, instead of uncongenial drudgery, her life was filled with satisfying work suited to her taste and temperament?

Training schools for preparing young women for self support in the way which suits them best will place before us a different condition of things. Physicians of both sexes are needful to attend to the diseases of each. Then our young women would not neglect their health till almost past remedy before consulting a physician.

Query: Are the natural infirmities of women a greater drawback to business occupations than the rapidly increasing infirmities of men for what is found in the saloon and gambling hall?

NELL VAN.

WHAT WOMEN HAVE GAINED.—For the time, still fresh in the minds of middle-aged persons, when there were no remunerative occupations open to women, when there was no high school for girls, no college that would admit women; when women lecturers, lawyers, doctors, editors, and ministers, were unknown, up to this time, when all these things and many others are free to women, the gain seems marvelous. But the gain in legal rights is even greater.

It is not thirty years since a married woman could not own money, even when she had earned it by hard work. She could not make a will of any property she possessed. She gave birth to a child, and the law said it was not hers. She could not make a contract. She could not make a valid deed of the land she owned. She could not be the guardian of children—not even of her own. She had only the pauper right, viz., the right to be maintained. All the hard work of her hands, and all the income from her brain belonged to the husband, who owned, and was supposed to support her. To-day a wife can legally earn and own; can buy and sell and sell and will; can make a valid deed; can be guardian of children, and, at the marriage ceremony is not necessarily required to promise to obey.

In Wyoming and Utah Territories women are voters. In Michigan more than forty thousand men at the polls cast their vote for woman suffrage. In many States women are legally elected and do serve on the school Board.

Iowa has taken the first legal step to secure suffrage to women. Three judges of the Supreme Court in Maine express the opinion that women may legally serve as justices of the peace in that State. In Congress and in every Northern state legislature, the equal political rights of women are discussed.

Thus, from the smallest of all beginnings, through three decades, has the good cause of woman's rights grown into place and power. Now it only waits to be crowned with woman suffrage.

To this end societies exist in every Northern State, supplemented by county and town societies, by political clubs, pledged to secure the election of legislatures of such men as will vote for the enfranchisement of women.

An army of women are leagued together in solemn covenant to secure their rights to a voice in making the laws which they are required to obey. The time cannot be far away when this will be accomplished.

As an incentive to activity, it should never for a moment be forgotten that in the different States the law makes women the political equals of paupers, idiots, lunatics, felons; of men guilty of bribery, forgery, illegal voting, duelling, treason, and any other crime or weakness which unfits men to be trusted with the rights of citizenship.

This picture of gain and loss closes the year 1874. May the next one end with brighter colors.—*Lucy Stone, in the Woman's Journal.*

SENSIBLE FASHIONS FOR WOMEN.—The dress committee of the New England Women's Club seek to make the changes in women's dress as unobtrusive as possible. They begin with the under garments. Those of the old style which they utterly condemn are the chemise and the corset. These they entirely abandon. The principles which they carry out are these —perfectly free action for the vital organs, thus abolishing all tight-fitting waists and all tight bands around the waist; an equalizing of the heat of garments over the entire body, and increasing it upon legs and arms; a reduction of the weight of the clothing, by making skirts as few and light as possible; the supporting of all clothing from the shoulders, by attaching skirts to waists or suspenders.

The garments already devised, which embody these principles, are the chemiloon and the gabrille underskirt. The first is made of flannel or cotton, a long-sleeved waist and drawers in one, covering the person from wrist to ankles. Outer drawers may be buttoned to these. The stockings are drawn over the long drawers fitting at the ankle, and fastened with safety pins, or with buttons fastened on the drawers. No garters are allowed, because these hinder the circulation of the blood. The gabrille under skirt is made of white cotton usually, gored from shoulder to hem, after the plain gabrille pattern, rather loosely fitting, and sufficiently short and scant. The outer skirts button upon it, so arranged that one band does not lie over another. If a hoop is worn (and this is recommended, as it keeps the folds of the skirt from clogging the limbs in walking, and holds the tops of the other skirts so as to prevent undue heating of the pelvis and spine), there should be a stout button hole in the middle of the back of the hoop band, to fasten upon a strong button on the back seam of the under skirt waist. On each side of this button hole place the buttons for holding common suspenders, placing the front buttons just over the firm side terminations of the upper hoops. This brings the suspenders back under the arms, so that they do not interfere with the bust. The balmoral may rest upon this hoop, with a binding made in semicircular shape, so as to lie upon the skeleton below its binding.

For outer dress, the plain gabrielle pattern is recommended, not too full in the skirt, and lightly trimmed if trimmed at all. This for the house dress; and an added polonaise or overskirt and sack for the street.—*American Agriculturist.*

A NOVEL EXPERIMENT IN HOUSE-KEEPING. The troubles and vexations which housekeepers seem inexorably doomed to suffer in consequence of the great difficulty—the apparent impossibility, as a general rule—of obtaining good domestic servants, have given rise to a variety of curious suggestions. Among these we remember none more singular than that which it is said an English lady is now subjecting to the test of actual experiment. It is not difficult to imagine by what process of reflection a woman of strong philanthropic impulses and hopeful nature, slightly dashed with the Quixotism characteristic of female reformers, might be led to conceive so extraordinary an idea. Probably the lady in question felt acutely the annoyance inseparable from the existing system of domestic service; on the other hand, she saw all over the land a class of young women needing employment, but unable to obtain any which, according to prevailing social ideas, they could accept without disgrace; a class sufficiently refined and well-educated to qualify them for at least the humbler grade of positions as teachers or governesses, and who for that very reason could not, without a painful feeling of degradation, become household servants. She saw that this class, already too numerous to find occupation of the kind deemed suitable for them, was rapidly increasing with the more general diffusion of education; and reflected that the time must come when a proportion of those belonging to it would have to choose between menial labor and pauperism, or accept a lot worse than either. She knew that it was not the actual hardship of the work involved in domestic service, but the popular idea that such occupation is only suitable for the ignorant, the illiterate and those coarsely reared, that made young women possessing a measure of culture and refinement shrink from it as from something almost equivalent to disgrace. Having thus got at the real difficulty in the case, the solution would not be far to seek for such a person as we conceive the originator of this new sociological experiment to be. Accordingly, we are told that she proceeded to put it to a practical test by dismissing her servants and engaging in their places five young women of the class that had aroused her benevolent solicitude. These were to act respectively as lady's maid, dairy maid, upper house maid, kitchen maid and cook. The terms of the agreement were that the new "help" or "domestic companions" (for of course no such word as servant figured in the contract) were to receive the same wages paid to the former incumbents of their respective positions; and further, that when off duty they should be treated in all respects as equals. When there is company they are to mingle with the guests and assist in entertaining them; when the lady of the house rides out, they are to join her; in short, all the existing barriers between the positions of mistress and maid are to be broken down. Such is the outline of the new social dispensation which is said to be now actually on trial.

AN ANTI-CORSET SOCIETY.—If there ever was a country distinguished for its love of moral and social revolutions, it is this country of ours. Some of the attempted revolutions are absurd enough, but others are not only sound but practical. Among these is the effort, the organization started in Brooklyn by a number of ladies, "to put down corsets, high-heeled boots, false hair, and such like auxiliaries to feminine attraction." This is an undertaking that at once commends itself to every man and woman of sense in the land. It will be supported heartily by the medical profession, and, we trust, both by the pulpit and the press. It is time that sensible people should put their foot upon senseless clothing.

CARBOLIC ACID A PRESERVATIVE FOR HIDES. In South America and Australia, it is stated that the immersion of hides for twenty-four hours in a two per cent. solution of carbolic acid, and subsequently drying them, has been successful substituted for the more tedious and expensive process of salting.

AFTER taking up a carpet, sprinkle the floor with a very dilute carbolic acid before sweeping.

Hygienic.

Milk as a Diet.

MILK being furnished by nature as the only food for the young mammal, during a certain period of its existence, contains all the elements necessary for the nutrition and growth of the body. Out of the caseine of milk are formed the albumen and fibrine of the blood, and the proteinaceous and gelatinous tissues. The butter serves for the formation of the fat, and contributes, with the sugar, to support the animal heat by yielding carbon and hydrogen to be burnt in the lungs. The earthy salts are necessary for the development of the bony system; the iron is required for the blood corpuscles and the hair; while the alkaline chloride furnishes the hydrochloric acid of the gastric juice.

It is somewhat strange that a prejudice should exist among the masses in relation to milk diet. Milk is in general readily digested by children and is universally conceded to be the very best diet for them. It is too true that when milk contains too much oily matter it often induces various disorders of the digestive organs. With such the milk which gives very little cream, or skimmed milk, usually agrees. Milk is a very useful and valuable article of food, both for the child and the adult, and for healthy individuals, as well as for invalids and convalescents. The principal drawback to its employment in many cases is the difficult digestibility of its fatty constituent, butter.

There is no more innocent food among the whole list of aliments than pure milk. It contains bone, muscle, fat, and brain producing substances, in an eminent degree, and just in the proper shade for assimilation. It is true that milk in inordinate quantities, or if the diet be suddenly changed to milk, the person will sometimes become constipated, perhaps, or else the reverse. But this is not due so much to the milk as to the change in the diet, for other changes in ordinary food would produce the same result. It is true there are some individuals who, from some peculiar condition of the digestive organs, can not take milk; and this exception will apply to almost every article of food; but these isolated facts do not invalidate the general rule.

One of the principal objections to a milk diet in the cities is the fear of adulterated or impure milk. This difficulty may be easily obviated by knowing of whom you get the milk. It is true that in cities a serious difficulty in this line exists, as there may be a large quantity of milk sold which is the product of breweries and distilleries; nevertheless, this is but a small proportion of the whole quantity used; the great bulk is brought direct from country dairies, and undoubtedly is furnished in a pure condition; or if anything be added it will only be water. The customer may test the article sold by the milkman and also that of the dairyman, and in the end it will result in honest dealing.

Milk is becoming one of the great reliances of the physician in various cases of disease, especially in typhoid fever, when the patient has become so low as to be incapable of taking solid food. It is used in the form of whey, and is an excellent diluent and nutritive. It may be used in febrile and inflammatory complaints. It is sometimes prepared by means of rennet, and is denominated "rennet whey." White wine whey, taken warm and combined with a sudorific regimen, acts powerfully on the skin and is a valuable domestic remedy in slight colds and febrile disorders. Cream of tartar whey is prepared by adding a quarter of an ounce of cream of tartar to a pint of milk. It may be diluted with water and used in febrile and dropsical compaints. Milk and lime water forms a very useful remedy in some irritable conditions of the stomach and uterine organs.

Washing the Inside of the Body.—There is no cavity in the body which water is not fitted for if you get it in properly. Why, one of the best things you can do is to wash your blood, and the great folly we commit in going through our lives from childhood to the grave is that we do not wash our blood as we ought. Infusions of coffee, tea, chocolate, or cocoa, or cider, or beer, do not wash the blood, because with the fluid so taken in, something is carried in also which befouls and defiles the blood. Just let a man say to himself, "It is Saturday night; I have worked hard all the week, and Sunday shall be a day of rest to me. I am now going to give my whole system, between this and Monday morning, a good thorough washing." So he begins to drink, and drink, and drinks but little at a time, yet between Saturday night and next Monday morning a healthy man can drink, without producing disturbance, a gallon of water. Now let this come into and go through his circulation—through his lungs, and skin, and kidneys, and bowels, and waste materials are carried out—and when Monday morning comes, if he jumps out of bed and gives his external skin a good washing, the water that he washes in will be foul. Or if he prefers to test that question even more thoroughly, all he has to do is to take a clean sheet, and wetting it in good, soft, pure water, be wrapped up in it for forty-eight or sixty minutes, and then have the sheet washed in a tub of water, and it will color that water so it will look dirty. The man has been washed inside —his blood has been washed. When you have washed his blood, tissues, bones, nerve, muscle, sinew, membrane and brain, and everything in him, he can defy all pestilence for that week. The washing of a person's outside is twice as necessary as the washing of a person's clothes, and yet there are those who are very particular to have their clothes washed with great care, who are not at all particular to wash themselves.

What Alcohol Will Do.—It may seem strange, but is nevertheless true, that alcohol, regularly applied to a thrifty farmer's stomach, will remove the boards from the fence, let cattle into his crops, kill his fruit trees, mortgage his farm, and sow his fields with wild oats and thistles. It will take the paint off his building, break the glass out of his windows and fill them with rags. It will take the gloss from his clothes and polish from his manners, subdue his reason, arouse his passions, bring sorrow and disgrace upon his family, and topple him into a drunkard's grave. It will do this to the artisan and the capitalist, the matron and the maiden, as well as to the farmer; for in its deadly enmity to the human race, alcohol is no respecter of persons.—*Temperence Worker.*

Sound Common Sense.—If you are well, let yourself alone. One of the great errors of the age is, we ngdicate the body too much, the mind too little. More persons are destroyed by eating too much than by drinking too much. Gluttony kills more than drunkenness in civilized society. The best gymnasium is a wood yard, a clearing, or a corn field. A hearty laugh is known, the world over, to be a health promoter; it elevates the spirits, enlivens the circulation, and is marvelously contagious in a good sense. Bodily activity and bodily health are inseparable. If the bowels are bound, lie down in bed, remain there, and eat nothing until you are well. The three best medicines in the world are warmth, abstinence and repose.—*Dr. Hall's Magazine.*

Wet and Dry Bathing.—If any one in these days will exercise in the open air, so that each day he will perspire moderately, and if he will wear thin under-garments, or none at all, and sleep in a cold room, the functions of the skin will suffer little or no impediment, if water is withheld for months. Indeed, bathing is not the only way in which its healthful action can be maintained by those living under the conditions at present existing. Dry friction over the whole surface of the body, once a day, or once in two days, is often of more service than the application of water.

The reply of the centenarian to the inquiry to what habit of life he attributed his good health and extreme longevity, that he believed it due to "rubbing himself all over with a cob every night," is significant of an important truth. If invalids and persons of low vitality would use dry friction and Dr. Franklin's "air bath" every day for a considerable time, we are confident they would often be greatly benefited. Cleanliness is next to godliness, no doubt, and a proper and judicious use of water is to be commended; but human beings are not amphibious. Nature indicates that the functions of the skin should be kept in order mainly by muscular exercise, by exciting natural perspiration by labor; and, delicious as is the bath, and healthful, under proper regulation, it is no substitute for that exercise of the body without which all the functions become abnormal.—*Dr. Nichol.*

Grasshoppers.

In reply to an inquiry by a correspondent of the New York *Sun* as to whether the grasshoppers so destructive to crops in the West are the same as those which infested Egypt, and also whether the seventeen-year is a native of this country or imported, its able agricultural editor, Mr. Fuller, says:

The grasshoppers of the Western States are of an entirely distinct species from those inhabiting Egypt or other portions of the Old World, but belong to the same family as the locust of ancient as well as modern times. Grasshopper is a mere local English name for the hundred or more distinct species which inhabit our country. The one to which you refer as doing so much damage in the Western States is known to entomologists as *Caloptenus spretus*. The seventeen-year locust is not a locust, that is, it does not belong to the grasshopper or *Locustidæ*, but to the *Cicadas*, a large species of flies, which have no mandibles for biting or masticating food like the true locust; consequently they do not consume vegetable food, and the only injury they do to plants is to puncture the stems and twigs in depositing their eggs. They are also native Americans, at least so far as is known to science or history.

The Preservation of Smoked Meat.—Professor Nessler says that the keeping qualities of smoked meat do not depend upon the amount of smoking, but upon the uniform and proper drying of the meat. It is of considerable advantage also to roll the meat on its removal from the salt, before smoking, in sawdust or bran. By this means the crust formed in smoking will not be so thick; and if moisture condenses upon the meat it remains in the bran, the brown coloring matter of the smoke not penetrating. The best place to keep the meat is in a smoke house in which it remains dry, without drying out entirely as it does when hung in a chimney.

Recently, at the Polytechnic School in Paris, one of the professors inquired into the habits of the one hundred and sixty students there, and then made a comparison between their devotions to study and to smoke. He found that in each grade of the school the students who did not smoke out-ranked those who did smoke, and that the scholarship of the smokers steadily deteriorated as the smoking continued. On account of several trustworthy reports of such a nature, the Minister of Public Instruction in France issued a circular to the directors of colleges and schools forbidding the use of tobacco to students, as injurious to physical and intellectual development.

Educational.

Before School.

"QUARTER to nine! Boys and girls, do you hear?"
"One more buckwheat, then—be quick, mother, dear.
Where's my luncheon box?" "Under the shelf—
Just in the place you left it yourself!"
"I can't say my table!" "O, find me my cap!"
"One kiss for mamma and sweet Sie in her lap."
"Be good, dear!" "I'll try." "9 times 9's 81."
"Take your mittens!" "All right." "Hurry up, Bill; let's run."
With a slam of the door, they are off, girls and boys,
And the mother draws breath in the lull of their noise.

After School.

"Don't wake the baby! Come gently, my dear!"
"O mother! I've torn my new dress—just look here!
I'm sorry; I was only climbing the wall."
"O mother, my map was the nicest of all!"
"And Nelly, in spelling, went up to the head!"
"O say! can I go out on the hill with my sled?"
"I've got such a toothache!" "The teacher's unfair!"
"Is dinner 'most ready? I'm just like a bear!"

Be patient, worn mother, they're growing up fast;
These nursery whirlwinds, not long do they last;
A still, lonely house would be far worse than the noise;
Rejoice and be glad in your brave girls and boys!
—[R. I. Schoolmaster.

Do Farmers Read Enough?

Is it not true that many farmers read very little, hardly enough of the news of the day to keep posted in regard to the current events of our country, to say nothing of the foreign news? Further, do they read that which pertains to their business, trying to improve the mind upon the great study of agriculture? This class do not seem to realize how much education and improvement of the mind have to do with farming. They count strong hands and muscle as the only requisites for successful farming. They depend altogether too much upon the weather and circumstances, and too little on skillful, intelligent management for success in their business. We know there are some who will say that this is not true—that many ignorant, unread men are quite as successful in tilling the soil as those who read. But we think we can point out some of the reasons to show that the same men could do better if more brain labor were applied in connection with the labor of the muscles. In the first place, mind is regarded as the measure of the man in every other profession; and all other business succeeds in proportion to the active knowledge and intelligence the man has who manages it. Why should it not be so with the farmer? Much as we value bone and muscle, brain are the most important. The body is but the tool, the mind is the hand that works it. It is to education and progress in the arts and sciences that all our enlightened and civilized countries owe their greatness. The barbarous have strength of body, and in many countries superior soil and climate to our own. Why has this country become great and prosperous except for its superior culture of the mind? Intelligence is strength, and whatever power or influence a people possess must be developed through the intelligence of that people. But, to apply it more practically to the business of farming, we would say that in no industrial pursuit is the improvement of the mind—education is the thing which pertains to the profession—more important. The desired culture and information can be gained mainly through reading. New and valuable ideas gained by reading and study will be as so much capital to him. A reader is generally a man of knowledge and culture, and he acts in proportion to his knowledge. We should read more agricultural books and papers, and if we can by reading ascertain a better way of doing any kind of farm-work, or make any advances whatever in theory or practice that would benefit us, we should be prepared at once to adopt it. If we have a farm of poor soil to be brought up to a certain standard, let us study the science of agriculture and the means best and most economically adapted to improve it as rapidly as possible. If we are the fortunate possessors of a soil rich in all the elements of fertility, it should be our constant aim and study to keep it so, and see that no injudicious system is pursued in its cultivation, and that its natural fertility remains unimpaired, but constantly improved. This applies also to every department of the business, whether it be in the cultivation of crops or the raising of stock. A farmer's library, books and papers, which are in the reach of everybody, will develop and improve the mind, so that farming will be done on correct business principles.—*New England Homestead.*

FOR THE BOYS.—Reflection upon observed facts is one of the best means of obtaining an education. Many men are wise who hardly know how to read. Knowledge is not wisdom; but knowledge to a greater or less extent is necessary to the one who would be wise. Now we gather knowledge—we learn facts by reading, by experience, and by observation. But we cannot be *always* reading; we would not wish to *experience* many things, but we can *always observe*, and that without danger to ourselves. We observe the experience of others, and if we be wise, make use of the facts thus gained to direct our own life.

Let me then say to the young, learn to observe, let nothing escape your eye or ear. For instance you are walking in the city, close by the corner of the street lies a man in the gutter. Notice him, look at his bloated face and bloodshot eyes, look at his rags, notice, observe, see him there, use your eyes. But as we come nearer to hear some remarks made by the men standing around him. Now listen, hear—"He was the best lawyer in the city, but drink has brought him here." So says a man who knows the drunkard. Now let us travel on while I teach you to reflect upon the fact which you have gathered by observation. Drink has brought the best lawyer in the city to the gutter. Upon reflection you will conclude that drink is the foe of mankind—a snare for the foolish, the destroyer of many strong men. So far, so good. Observation well made. Reflection has done her work well. Now comes the test. Are you wise? Let me see. Come with me and have a drink. If you will go in now and drink then you are a fool. You did not know how to apply the result of you observation and reflection to your own life. Oh, you won't go, won't you, then you are wise. Observation and reflection has given you a principle, and you wisely apply that principle to your own life. Let us, while young, learn to observe. Reflect upon the facts thus learned, and then show our wisdom by the application of these principles to our own life. What good will a head full of facts like the above do us, if we do not apply them to our lives? The carpenter may have his chest full of tools, but if he will not use them they will benefit neither himself nor any one else. A few tools well used will benefit more than many never touched. So a few facts well thought over and strictly applied to the life often make a man great, when the walking library is often a sot. Let us then gather facts as we may, by reading, experience, or observation. Reflect upon and deduce principles therefrom, and apply them to our lives, and be not only educated, but wise.

DIVERSITY OF GIFTS.—One of the most difficult questions parents are called on to settle concerns the particular training each individual child requires. No two of a dozen children in the same family agree in disposition, in ability, in taste and inclination. Each has his idiosyncracies and his special gifts which render special treatment necessary. One boy has a passion for farming, his brother delights in music, still another enjoys using tools and solving mathematical problems. What folly it would be to subject these three boys to the same curriculum of study, and expect in this way to make the most of them as men. Not what we put into a boy's head educates them, but what we draw out of it. Education is a process not of cramming, but of development, and wise are those parents who, understanding the abilities of their children, suit the training each receives to his special requirements. It is not easy in a multitude of cases to tell exactly what particular talent a boy or girl possesses. We must wait for time to develop his or her special gift, and while so doing give the best general training in our power, shaping the child's course in the direction in which it seems most probable he will be successful in winning the desirable things of this life, and so winning them as not to lose in the life to come.—*Mrs. Lyman, in N. Y. Tribune.*

TEACHER—"John, you young scapegrace, come here, and I'll pay you back your impudence to me yesterday."
Pupil—"No, thank you, I have conscientious scruples against taking back-pay of that sort."

Live and Dead Weight of Cattle.

It is well known that the amount of flesh obtained from animals sold by live weight is exceedingly variable, even in animals of the same breed, as so much depends on the condition or fatness of the beast. There is also a great variation in the quality of the meat in breeds; as a rule, the finer the breed of the animals the more eminent the prime points, the Short-horns and Herefords being noted for muscle and fat, and the Ayrshires and Jerseys being types of milk producing breeds. Again the Jerseys are eminent for richness of milk, and the Ayrshires for quantity. The English, French and Belgians have instituted numerous experiments to show the weight of the different parts of the animals slaughtered. Two instances, one a bullock, another a sheep, will suffice.

In the case of an ox a live weight of 1,322 pounds yielded, meat, 771.4 pounds; skin, 110.5; grease, 88; blood, 55; feet and hoofs, 22; head, 11; tongue, 6.6; lungs and heart, 15.34; liver and spleen, 80.5; intestines, 66.15; loss and evaporation, 152.72; making the total of 1,322 pounds.

The product of a sheep weighing 110.02 pounds were as follows: Meat, 551; skin, 7.71; grease, 5.51; blood, 5.508; feet and hoofs, 1.204; head, 4.409; tongue, lungs, heart, liver and spleen, 3.408; intestines, 6.612; loss and evaporation, 19.656; making a total of 110.02 pounds.

French statistics show that the same cattle yield as much as 70 per cent. meat, while others give only 50 per cent. The mean weight of meat produced is estimated at 55 per cent. of live weight. In the case of the sheep, the production is from 40 to 45 per cent., the fatter animals always give the greatest net weight.

To show how the same rule will apply to the United States, we may state that in New York native steers are allowed fifty-six pounds to the hundred, live weight. while grades are estimated at forty-six pounds per hundred. As an instance, weighing net 500 to 700 lbs, will bring 8¾ to 12½ cents per lb; those from 700 to 800 lbs will bring from 12½ to 14 cents, and grade steers 875 to 1,200 lbs will bring 12¼ to 15 cents, and weighing 1,400 to 1,500 lbs will bring 14 to 18 cents.

THE propagating houses of the Agricultural Department of the State University, at Berkeley, were ready for use last August, and since that time, says the Oakland *News*, 10,000 plants of 20 species of eucalyptus; 5,000 acacias of 25 species, 200 species of native and foreign coniferæ, also numerous rare ferns peculiar to Australia, South and Central America, and elsewhere, and many species of textile, medicinal and other economic plants have been produced. We may mention 112 varieties of roses, 12 of azaleas, 13 of camelias, and 6 of magnolias, for ornamental purposes.

COMING STOCK SALES.

We gather from advertisement in the *National Live Stock Journal* the following announcements of sales of fine stock to take place at public auction during April and May, 1875.

April 6th—C. C. Parks & Co., Waukeegan, Ill.; 30 head of Clydesdale horses and over 50 Cotswold sheep.

April 7th—C. C. Parks sells the entire Glen Flora herd of Short-horns—126 head.

April 8th—Elliott & Kent will sell the entire Elm Grove herd of Short-horn cattle, at Dexter Park Stock Yards, Chicago; Ill.—65 head,

April 9th—J. H. Lissinger & Co. sells Short-horns at Dexter Park, Chicago, Ill.—45 head.

April 14th—S. W. Jacobs, West Liberty, Iowa; Short-horns of the "Wapsie Herd"—70 head.

April 15th—Milton Briggs, Kellogg Station, Jasper county, Iowa, will sell, on Oak Hill Stock-farm, 140 head of Short-horns and 100 head of Berkshire swine.

April 21st—John Dolese & Co., Summit, Ill.; 54 head Grade Norman horses.

April 27th—J. H. Pickerell, Decatur, Ill.; 23 head of the Harristown herd of Short-horns. Also 22 Southdown ewes, and 12 Berkshire swine.

April 28th—Messrs. Duncan, Smith, Franklin & Nichols, Decatur, Ill., will sell 130 head of Short-horns.

April 29th—J. H. Spears & Son, Bloomington, Ill., 40 head Short-horns.

April 30th—Messrs. Prather & Foster will sell 70 head of Short-horns, at Springfield, Ill. Also, W. Black of Carrollton, Ill., will sell Short-horns at same time and place.

May 3d—W. G. Harding, Nashville, Tenn., 30 head fine bred horses.

May 7th—S. Meredith & Son, at Cambridge City, Ind., will sell a lot of Short-horns.

May 18th—James H. Davis, Danville, Ky., will sell 50 head of Short horn cattle.

There will also be sales of Short-horns at Dexter Park Stock Yards, Chicago. On May 19th, L. W. Thorn, 30 head; 20th, J. P. Sanborn, 75 head; 21st, Avery & Marphy, 75 head; 22d, J. R. Shelly, 110 head.

May 27—Chas. Lowder, Plainfield, Ind., will sell 70 head of Short-horns and 50 Berkshire Pigs.

Our readers will be interested in Dr. Scott's article in this number on "The Cultivation of the Olive in California." Whatever subject he "touches pen to" is ably handled.

BEAUTIFUL SCULPTURE.

At the well-known marble works of Field, Combs & Gregory, San Jose, we lately noticed a piece of monumental work that surpassed anything of the kind we ever saw. It was designed by Norman Porter, Esq., for his wife's grave. The design was unique, and showed originality and genius, while the work exhibited skill of a high order. A heavy shield, bearing an inscription, framed in a border of scroll work, was surmounted by an exquisite wreath of flowers, which were brought out, leaves and petals, from the stone as natural as possible, looking rich enough to ornament a parlor vase, and too delicate for out-of-doors, even in our fine climate, where real flowers are almost perpetual. Evidently Mr. Comb's own hand wrought out this wonderful wreath, for who else but him, on this Coast, could do such equisite work?

THE SAN JOSE BEAUTY.

Prof. A. H. Rockwell met not only with grand success in his excursion through our section of country, giving lessons on horse training to large enthusiastic classes of citizens, but his second advent in San Jose was an ovation. He obtained many more new members to his large class here, and managed to interest large audiences all the time, not only with exhibitions of his skill in handling wild and vicious horses, but by giving rational, common sense instruction and explanations of his methods.

As a token of the estimation in which Mr. Rockwell was held by his class, several members clubbed together and purchased of Mr. Benj. Fish, of Santa Clara, a high-bred Comet colt for $200 and presented it to Mr. Rockwell on the last evening of his visit. The colt was named the "San Jose Beauty," and declared by all present to be a perfect beauty and wonderful for his age. We shall expect to hear from this colt at some future time, as a credit to its name. The colt was worth much more than was paid for him, but Mr. Fish generously consented to contribute a liberal share of the gift. We understand that Mr. Rockwell, before leaving this county, refused an offer of $1,000 for the colt. He says that he will make it worth over $10,000 in three years' time, and we believe him.

The presentation, though a perfect surprise, was a nice little affair. Lawyer Gibson made a fine little speech, and Mr. Rockwell, evidently embarrassed, returned his compliments in a modest manner indicative of the "inner man."

THE BEST HORSE-POWER.

Our readers will notice Mr. Pelton's advertisement of his six-fold horse-power, which, in mechanical construction, is very nearly perfect. The powers have also stood the test of trial; and the evenness of pressure upon the numerous bearings is so balanced that there is less friction to be overcome to a given amount of power than in any horse-power we have ever seen. Fourteen horses have threshed 2,000 bushels of wheat within ten hours, in good threshing, with a Pelton six-fold power more than once. We have examined testimonials of practical men whom we believe to be reliable, and also talked with men who know what the machine will do. The manufacture of these powers in San Jose is an industry we feel proud to note.

THE GREAT MENAGERIE AND CIRCUS.

Montgomery Queen's great menagerie and circus, which has been wintering at Hayward's, California, is about to enter the field for a season's show in this State. Several new and valuable animals and birds have lately been added to the grand collection at great expense, and the best performers in America have been added to the circus troupe, which is now the best that ever performed on this continent.

Lompoc.

A correspondent of the Santa Clara *Argus* writes as follows of this new and flourishing colony in Santa Barbara County.

If there are any of our friends that wish to purchase lands of the company, they would do well to come down before the sales which begin on the 26th of April, as there are only about 2,000 acres of the main valley left. The prices for choice land range from $25 to $75 per acre. Purchasers have ten years in which to pay for their lands. There are over 30,000 acres of grazing lands for sale, including the table-lands near the beach and the rich Hondo valley. The Santa Inez river bounds the land on the east and north. The river is a large stream of clear, pure water, its banks lined with heavy timber. There is a belt of timber running through the middle of the main valley twelve miles long. No purchaser will be more than one mile from timber.

There are four large creeks and numerous springs on the ranch. The deepest well is thirty-two feet, the shallowest eight. Every acre of the valley will produce a paying crop of corn, tobacco, flax, barley, wheat or vegetables, without irrigation. The unplowed lands are covered with a heavy growth of oats, clover and filaria. There is no alkali, no worthless land. Those who do not purchase will at least have the pleasure of seeing the most fertile spot of the State. The town site is the handsomest and best laid out of any on the coast. It is well supplied with the best water by the San Miguelita. Since January 330 lots have been sold at from $100 to $500. Every lot that has changed hands since the sale has been at an advance.

The contractors are ready to begin the wharf, and expect to finish by the 1st of May, 1875. Freight from here to San Francisco will not exceed $2.50 per ton by schooners. Persons shipping should send their freight by Mr. Clayton, of San Francisco, to Point Sal. There is a good road from here to Point Sal. Teams should come by Guadalupe and strike the Point Sal road. It will not be necessary to bring hay or barley, the grass is good and abundant. It will be well for parties coming to bring tents; house-room is very scarce just now.

There are four stores, three boarding-houses and three blacksmith shops. No whiskey will ever be sold on the rancho; families ought to think of this as one of the best recommendations. The company has made ample provision for the future accommodation of schoolchildren.

Thorough Culture.

The theory that there can be no drought in the soil which is plowed so deeply and comminuted or pulverized so thoroughly that the air can strike down into it far enough to come to a temperature below the dew point, is nothing new. That theory, says the *Maryland Farmer*, has been familiar to scientific agriculturists for years. It is founded on the fact that whenever the atmosphere comes in contact with a substance colder than itself, moisture is precipitated, no matter how dry the season may be. So, if a soil be so prepared that the atmosphere can penetrate it to a point where the soil is colder than atmosphere, moisture will be precipitated at that point, and then, by capillary attraction, be drawn through the soil to the surface, whereby whatever is growing or planted in the soil will be refreshed.

This is all very fine where the dew point is above the temperature of moist earth, and the atmosphere is loaded with moisture, but in our dry, sunny climate the dew point is lower than the moist soil, and the soil would dry out instead of collecting moisture from the atmosphere.

I. O. G. T.—GRANGER LODGE, No. 295, meets every MONDAY evening, at 8 o'clock, in their Hall, No 284 Santa Clara street, over the S. J. Savings Bank. Members of sister Lodges and sojourning members in good standing are invited to attend.

S. B. CALDWELL, W. C. T.

JOHN B. STEVENS, W. Sec'y.

HOW TO PAINT,

A New Work by a **Practical Painter,** designed for the use of **Tradesmen, Mechanics, Merchants, Farmers,** and as a Guide to **Professional Painters.** Containing a plain, common sense statement of the methods employed by Painters to produce satisfactory results in **Plain** and **Fancy Painting** of every description, including **Formulas for Mixing Paint in Oil or Water,** Tools required, etc. This is just the Book needed by any person having anything to paint, and makes **"every Man his own Painter."**

Full Directions for using **White Lead, Lamp-Black, Ivory Black, Prussian Blue, Ultra-Marine, Green, Yellow, Vermilion, Brown, Lake, Carmine, Whiting, Glue, Pumice Stone, Asphaltum and Spirits of Turpentine, Oils, Varnishes, Furniture Varnish, Milk Paint, Preparing Kalsomine,**

PAINT FOR OUT-BUILDINGS,

Whitewash, Paste for Paper-Hanging, Graining in Oak, Maple, Mahogany, Rosewood, Black Walnut; Hanging Paper, Staining, Gilding, Bronzing, Transferring Decalcomania, Making Rustic Pictures, Painting Flower-Stand, Mahogany Polish, Rosewood Polish. Varnishing Furniture, Waxing Furniture, Cleaning Paint,

PAINT FOR FARMING TOOLS,

for Machinery, and for Household Fixtures.

TO PAINT A FARM WAGON,

to Re-varnish a Carriage, to make **Plaster Casts.** The work is neatly printed, with illustrations wherever they can serve to make the subject plainer, and it will save many times its cost yearly. Every family should possess a copy. Price by mail, post-paid, **$1.** Address

Agriculturist and Live Stock Journal,
SAN JOSE, CAL.

Singer Sewing Machines.

Rooms, No. 334 Santa Clara st., San Jose.

A. C. PERKINS,

Agent for Santa Clara County.

The Singer Sewing Machine Company sold, in 1873, 352,441 Machines, and 113,254 MORE THAN ANY OTHER SEWING MACHINE COMPANY.

☞ We have a First-class Machinist employed, and make the repairing of all sorts of Sewing Machines a specialty. Old machines taken in exchange for new. All work warranted.

J. N. SPENCER,

Real Estate Agent

AND

General Auctioneer.

FARMS OF EVERY DESCRIPTION—Valley and Hill lands—High and Low priced Farms—Farms to suit everybody. Correspondence solicited. Business Chances a specialty. Property of every description bought and sold. Houses rented, and Loans negotiated. oc

PAINTER'S Manual—House and sign painting, graining, varnishing, polishing, kalsomining, papering, &c., 50 cents. Book of Alphabets, 50; Scrolls and Ornaments, $1; Carpenter's Manual, 50; Watchmaker and Jeweler, 50; Taxidermist, 50; Soap-maker, 25; Authorship, 50; Lightning Calculator, 25; Hunter and Trapper's Guide, 30; Dog Training, 35. Of booksellers, or by mail. JESSE HANEY & CO., 119 Nassau street, N. Y. 16

FARMERS' UNION.

(Successors to A. PHISTER & Co.)

Corner of Second and Santa Clara Sts.,
SAN JOSE.

CAPITAL - - - - - $100,000.

WM. ERKSON, President. H. E. HILLS, Manager.

Directors:

Wm. Erkson, J. F. Dudley,
L. F. Chipman, David Campbell,
Horace Little, James Singleton,
C. T. Settle, E. A. Braley,
Thomas E. Snell.

☞ Will do a General Mercantile Business. Also, receive deposits, on which such interest will be allowed as may be agreed upon, and make loans on approved security.

SAN JOSE
SAVINGS BANK,

286 *Santa Clara Street.*

ARTHUR'S

Illustrated Home Magazine.

Bright, Cheerful, progressive, always up to the advancing thought of the time, the HOME MAGAZINE takes rank with the leading and most influential periodicals of the day.

1875

It is on the side of Temperance and true Christian morality. Whatever is hurtful to Society it condemns without fear or favor, and makes itself felt in the homes of the people as a power for good.

The Great Household Magazine of America is more thoroughly identified with the people in their home and social life than any other periodical in the country.

"Deborah Norman:" HER WORK AND HER REWARD." A new serial story by T. S. Arthur, will be commenced in January.

"Fifty Years Ago;" OR, THE CABINS OF THE WEST." By Rosella Rice. These papers will be fresh and new, and of unusual interest.

Homes for the People, a series of admirably suggestive articles on Homes and how to make them pleasant and attractive. By Mrs. E. B. Duffey.

"The Story Teller." This department will be unusually rich. Besides an abundance of short stories two or three serials will be given during the year.

"Pipsissiway." Potts, the inimitable delineator of Home Life and Character, will have an article in every month.

Butterick's NEWEST PATTERNS for the ladies' and children's dresses, are given by special arrangement every month.

"The Lion in Love," and **"The Interrupted Reader,"** two large and splendid premium engravings. One of these sent free to every subscriber.

☞ Publishers of the AGRICULTURIST will supply the above Magazine one year, with premium engraving and patterns, post paid, for only **$2**—the regular price is **$2 50.** Send in yourorders at once.

Address, AGRICULTURIST, San Jose, Cal.

Something of Interest to Farmers.

The rapid growth of our country, and the constantly increasing demand for practical and durable farm machinery, has brought the Wind-mill into almost general use. Its practical value is no longer doubted; no well-regulated farm can afford to be without it. By its use bed-dry pastures can be watered, swampy lands drained, gardens irrigated, water supplied for house and barn, wood sawed, corn shelled, feed cut, meat, Graham and buckwheat flour made at home for your own use and that of your neighbors—in short, all the work that is done on a large farm, and which at some seasons of the year necessitates the employment of two or three extra hands.

There are so many new and cheap mills in the market that we feel it our duty to caution our farmers that they look at the mill and not the price, examine the record and know that the mill is one that has been thoroughly tried at least three years by some one. Wind is an unruly element and unless a wind-mill is built upon true mechanical principles and from strong and durable material, it is liable at any time to be destroyed. It costs just as much to erect a poor mill as a good one, and it will not pay to run the chance of losing your labor, time and mill for a few dollars more at the start. There is just as much difference in wind-mills as in cloth. A good article costs a little more but wears enough longer to pay for the extra cost. Being the original inventors and first manufacturers of what is now known as the Solid Wheel Mill, we feel that it is our privilege to caution those about to purchase wind-mills. We commenced over eight years ago, and have faithfully protected all our mills and guaranteed their work. Our mill has been thoroughly tried, and is now in use in thirty-three States and Territories. Seven wind-mill companies are now manufacturing under our license, but none of them are allowed to make our particular mill. By actual test and mathematical calculation we secure 16 per cent. more power than any other wind-mill. We can obtain this because our fans are much wider and two inches longer on a ten-foot mill, and the wheel and tail being in a line the mill gets all the wind. The Eclipse is not a cheap mill, except as an investment. Our mills cost $10 more than the general average price of other mills. We can build a cheaper mill for those that wish it, but having had a long experience, we know that an honestly built mill cannot be made cheap. We are able and willing to guarantee our work, and parties desiring something strong, durable and powerful, will consult their interest by either sending for our illustrated circular or calling on our general agent, Respectfully,

WM. H. WHEELER, Supt.
Eclipse Wind-Mill Co., Beloit, Wis.

These mills are being introduced on this coast through Mr. Charles F. Hoag, of Nos. 18 and 20 Fremont street, near Market street, San Francisco.

Mr. Hoag has mills from 10 feet to 45 and 60 feet in diameter, and from 2 to 50 horse-power.

Mr. I. A. Hatch, San Jose, is agent for Santa Clara county. He has had much experience in erecting mills and tanks, and will guarantee his work and the mills he puts up. my

CARBOLIC ACID.

Its Nature and Uses.

BY JOHN D. SCOTT, M. D.

EDS. AGRICULTURIST: In 1832 Reichinback discovered in beech tar a peculiar substance which, from the property which it possessed of preserving meat, he called *creosote*, from two Greek words meaning meat-preserver. Two years afterwards Runge discovered a similar substance in coal tar, to which he gave the name of Carbolic Acid, a contraction of carbon-oil-acid. It was contended for some time that these two substances were identical, but upon careful chemical analysis they were found to be distinct articles, although possessing some analogous properties. "It differs from creosote by being decidedly acid, in being precipitated by acetate of lead, and not being acted upon by ammonia and air, but changed by even dilute nitric acid into a red-brown substance; it also precipitates gelatine; all which properties are wanting in creosote." Owing, however to this close resemblance, creosote is often largely adulterated with carbolic acid.

In the shops it occurs in two forms, solid and liquid. When perfectly pure it is found in white masses, or crystals, or in a white liquid heavier than water, but as ordinarily kept the crystals and liquid are of a more or less brownish-red color, owing to impuritics. It combines with lime and other bases, when the products are known as carbolates, some of which are very valuable and largely used in the arts.

It is very volatile, hence its great value as a disinfectant. It is also powerfully antiseptic. A green hide immersed for 24 hours in an aqueous solution of the acid of the strength of 10 or 15 per cent. will be preserved upon drying for years from putrefaction. It instantly deprives stinking fish or meat of its offensive odor, and arrests further decomposition by arresting the putrefactive fermentation. It is therefore one of the most valuable agents in the process of embalming bodies, and in preserving the skins of birds, animals and reptiles from further change in our cabinets and museums.

It was largely used in our late unpleasantness by surgeons on both sides of the Potomac in gun-shot wounds, diseases of the bones and foul suppurating abscesses with the most gratifying results. It not only acted as deodorizer, but stopped at once the putrefactive fermentation, thus striking at once at the root of the evil. The explanation of its salutary results may be found in the fact that their morbid processes are not only originated but kept up by exceeding minute, but poisonous, organisms to which carbolic acid is instant death. By injecting solutions of 5 to 10 per cent. of the acid to the water they are destroyed by the million, and by keeping the parts well bathed with the lotion, or covered with cloths wrung out of it, their recurrence is prevented.

Taken in medicinal doses, say one to two grains or drops to the ounce of sweetened water, and being absorbed into the system, it seems to exert a specific effect upon the kidnays and bronchial tubes, thus constituting a most valuable diuretic and expectorant. Hence the flooding of the market with carbolic troches.

But its most important use has been thought to be in the destruction of those vegetable spores and morbific animalcules which have of late been proven to be the prolific source of many epidemic and contagious diseases among

MEN AND DOMESTIC ANIMALS.

It has been shown that it acts with distinctive agency upon these germs out of the body, and it has been reasonably concluded that it would act with equal effect upon them in the body. With this view it has been administered internally, but not sufficiently long and extensively to demonstrate its absolute merits.

A few drops of a weak solution are sufficient to prevent the mould on ink and other vegetable solutions. In the concentrated form, it is said to have been used to destroy the poisonous effects of dissection wounds. It has been recommended in vomiting, diarrhœa, dyspepsia and flatulence. Whenever putrefaction or even common fermentation is suspected in the stomach, carbolic acid by its antifermentive and anti-septic properties would be of undoubted efficacy.

From the properties of carbolic acid already known and acknowledged it was confidently expected that it would act equally well as a worm medicine; and in the few trials that have been as yet made with it, it has not disappointed that expectation. Against the lumbricoids or large red worms it has been found efficient, and used in the form of weak injection we might reasonably hope to find it equally serviceable against the pin worm so distressing both to grown persons and children.

Owing to its detergent and antiseptic properties it makes an excellent dentrifice cleansing the teeth and the interspaces between them and sweetening the breath.

In scarlet fever, diptheria, erysipelas and other diseases dependent upon a morbid condition of the blood, it may be used not only hygienically but internally with the reasonable expectation of exerting an antiseptic action on that important fluid. Upon old, indolent and foul ulcers, either in the form of a weak lotion or ointment, it acts with great energy by not only cleansing them but by stimulating them to renewed and healthy action.

In the crystals or concentrated liquid form it acts as a powerful caustic, turning the parts white to which it is applied and removing the cuticle, which, before separation, turns to a dark, brownish color. The application produces severe pain, which lasts for an hour or more, and the acid in this form should be used with extreme caution. It is by its powerful caustic effect in killing the nerve that it instantly relieves the toothache; but it should never be used in this way by unskillfnl hands, as it will produce painful eschars in the mouth wherever it touches. Of course, such a powerful disorganizer, when taken into the system, would produce the most violent and fatal effects. A solution of lime in water, which converts the acid into carbolate of lime, would be, put up, the readiest and most effectual antidote.

In itch it acts as a specific, destroying the insect whose presence and ravsges constitute the disease. It is equally serviceable in many other skin diseases, particularly those of the head and scalp. In these cases it is used as a wash, ointment, or bath, In diseases of the ear with purulent and offensive discharges it has been found particularly beneficial. In scalds and burns, in the proportion of 10 to 15 drops to the ounce of water it has been highly recommended. It is said to allay the pain instantly and dispose the parts to heal kindly and without subsequent contraction.

It may be given internally in the dose of 1 or 2 grains, or drops, as the case may be, in one ounce of sweetened water. As a caustic, it is used as obtained from the shops, care being taken to limit its application to the diseased parts. As a lotion to the skin, it may be dissolved in the proportion of 1 part of the acid to 100 or 200 of water. As an application to the throat in scarlet fever, diptheria, bronchitis, catnrrh, etc., as spray in an atomizer, it may be used in the proportion of one grain or drop to the ounce of water, gradually increasing the strength to 4 or 5 as thought advisable. As a gargle in such cases, take 20 grains or drops of the acid, half a drachm of vinegar, 2 ounces of the tincture of myrrh, and 6 oz of water, This is said to fail but seldom in diptheria. As an ointment for cancers, ulcers, etc., 5 grains or drops may be rubbed up with an ounce of lard, unsalted butter, suet or simple cerate, and applied on cloths. As its prophylactic and disinfectant properties are not among the least of its virtues, it may be dissolved in the proportion of an ounce of the acid to one gallon of water and hung round the sick room in cloths saturated with the solution, introduced into the dejections, and sponged from time to time over the bodies of the sick. It is thought to have exerted very beneficial effects, used in this way, in private and hospital practice, in arresting the spread and mitigating the severity of erysipelas, diptheria, puerperal, scarlet, yellow and typhoid fevers. During the prevalence of such epidemics, no house or hospital with a single case of any of these dangerous diseases should be without an abundant supply of this valuable disinfectant. In times of epidemics and pestilences our street sprinklers might be converted into powerful sanitary agencies by the addition of a few ounces of the acid to each barrel of water.

It was thought to have exerted a highly useful effect in checking the spread and moderating the severity of the late

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

An industrial exhibition will be held under the auspices of the Mechanics' Institute, in the city of San Francisco, to be opened on Tuesday, the 17th of August, 1875, at 11 a.m. and to continue open at least one month thereafter.

Our compliments are due to Mr. Boots, of Alviso, for a box of mammoth aparagus. His locality, near the bay, can beat the world on asparagus. Some of the stalks measured 4¼ inches in circumferance, and many exceeded four inches, and Mr. Boots said that he did not bring us the biggest either.

Great anxiety is felt and expressed on every hand as to what shall we do with the many immigrants who have come and are coming here this dry season, who have not the means to purchase homes and business. The question is simply answered to the point: Encourage families to find cheap lands and settle upon them; aid individuals in finding employment, or give it them if possible; instead of hiring Chinamen because they work cheap, open your Christian hearts and give work to your own countrymen and women, who come here to live, and who need your aid, and are able with faithful work to return your consideration. The country is large enough for millions of industrious people. Let us all encourage the immigrants that are coming, and let John go to the Celestial Kingdom where all his interest and his bones must lie. Another thing. There are many tracts of land now held in large bodies that may be bought up and divided into small farms and sold on easy terms. Here is a chance for the wealthy to show their philanthropy by investing safely and wisely and well.

We call attention to the article from Dr. Scott on "Carbolic Acid." Stock-raisers, sheep-herders and poultry-keepers, many of them, already know the value of carbolic soap as a destroyer of lice, scab, etc. It is only a few years since its efficacy was known. But few scientific authorities, and those only the latest, contain the information which everybody desires. We have often been requested to publish something late and reliable upon this subject, and how to use carbolic acid in destroying animal and vegetable parasites, etc. Dr. Scott is your man. What he has not explained on any point to your satisfaction he will endeavor to do through our columns, if requested by those desiring it.

Give the Children a Chance.—We second the hints here given by a lady in an exchange: "I would give every boy and girl something to raise, which they might enjoy the profits of; the girl could have fruit trees, strawberry beds, bees, poultry; the boys, colts, calves, sheep and farm crops. It should be understood that this must not interfere with regular school or family duties. It should be play-work to earn the wherewithal for greater pleasure. I would treat my children in these matters in the most scrupulous and exacting business way, without any indulgence—leaving them to get the lessons of their mistakes, just as they will have to do in the outside world."

CONDITION OF THE FRUIT CROP.

All over the State the April frosts were severe. We have intelligence from Los Angeles that early potatoes were killed and much fruit injured. When they have such frosts there, the rest of the State must suffer worse. Much fruit at Marysville has been destroyed. All over the State apricots and almonds are cut short, almost without exception, and peaches will be scarce. We notice favorable reports from Santa Barbara only. In some localities even apples and pears are killed—not the trees, but the fruits. About San Jose we have taken pains to ascertain definitely the condition of the fruit crop.

Mr. C. T. Settle, manager of the Alden drying factory, says his apricots and almonds are all killed. The French prune—Petit Prune de Agen—is nearly all killed. The Hungarian prune—Gross Prune de Agen—is half destroyed. The Ickworth's Imperatrice plum, a valuable sort, is not injured. The Black Tartarian cherry is badly cut off; not half a crop. Other varieties a full crop. There will be two-thirds of a crop of pears; the Seckle and other early varieties suffered most; late pears all right. Apples will show little injury; the Red Astrachan and White Winter Pearmain are killed the worst. Blackberries and grapes were not advanced enough to be hurt.

Mr. Patterson, who has the finest prune orchard in the country, says his crop is nearly all killed. The only prune that escaped is the Fellenburgh. His testimony generally agrees with Mr. Settle's. He adds the Bradshaw plum to the list little injured, and says the Winter Nellis suffered worst of any pear. Mr. Patterson's place is on low, moist soil, and he seems to suffer a greater loss from frost than any other one, which is unfortunate.

Judge Archer and Mr. Sweigart, who are largely engaged in cherry orcharding on higher soil, report the almost entire loss of Black Tartarian cherries. The Gov. Wood and Napoleon Bigarrean have escaped injury; other varieties not much destroyed.

Mr. Tarleton, who is an extensive orchardist, reports but little injury to his fruit crop. Early strawberries generally were badly killed, but the late crop will be enough greater to make it up.

LANDS FOR IMMIGRANTS.

If immigrants who come to this State without means to purchase farms in settled districts will strike out for outside public lands, they will stand a chance for homes and fortunes in a few years. But they must be brave and venturesome and enterprising to succeed. We point out a few places. The *Call* says:

We can state, on the authority of the Lakeport *Bee*, published in Lake county, that Deputy United States Surveyor Perrin has just completed the survey and subdivision of townships 10, 11 and 12 north, range 13 west, and of township 12 north, range 12, in that county, which tracts are now open to homestead and pre-emption entry. The *Bee* says that these lands are good for farming purposes. They contain timber in abundance and are well supplied with streams of running water. Lake is one of the most healthful and beautiful of our counties. It contains numerous patches of grazing lands, and is among the first butter and cheese localities of the State. The *Bee* invites population, and there is not, perhaps, any region where the inducements are greater for settlement.

SHASTA DISTRICT.

We are informed by the United States Register of the Shasta District that there are hundreds of thousands of acres in his district of unoccupied land—some good farming, excellent grazing, and fine timber land. This is one of the largest districts in the State. It extends from the town of Tehama to the Oregon line, and ninety miles wide.

One of the most remarkable of the natural features of our State is the existence of two great mountain ranges, running northwest and southeast, viz., the Sierra Nevada and Coast Range of mountains. Near the northern boundary of the State they are connected by means of a latitudinal range, in which stands the grand and majestic Mount Shasta. Mount Shasta among the mountains of this section of the country is like Saul among the thousands of Israel. It is one of the grandest mountains that we ever gazed upon. The contrast between the living emerald and the fairy-like garment of pure white is splendid beyond description. For eight thousand feet or more the mighty giant is clothed with various trees of evergreen, but the upper portion is robed in a garment of virgin purity.

Who would not like to own a fine farm under the wing of this sublime Mount Shasta?

The Sacramento *Agriculturist* thus speaks of Lodi:

The little town of Lodi—formerly known as Mokelumne Station—is one of the most delightful rural retreats in the great San Joaquin valley. As an objective point for immigrants, it possesses many advantages worthy of favorable consideration.

The statistics of the Government show that tobacco costs the nation many millions more than its bread does.

Poetry.

For the Agriculturist.

Grasshoppers.

BY WALTER.

THOU curse of Western emigration—
A scourge, in fact, to all the nation,
And we may say, to all creation;
As great an evil as infation,
Or slavery, ere emancipation;
But one from which there's no salvation
For one whose helpless situation,
With farming for his occupation,
And little under cultivation,
Who raises on his small plantation
Just food enough for Winter ration,
Indulging the anticipation,
And in the self-congratulation
That he has overcome starvation,
While thus in contemplation,
Lends wings to his imagination,
And feels he's under obligation
To the great Author of creation,
His neighbor comes with information
That this four-winged abomination
Is eating up his vegetation,
And comes without an invation,
And yet with a determination
To leave behind him devastation—
Alas! complete annihilation!

Long Lake, Minnesota.

Some One's Servant Girl.

She stood there leaning wearily
Against the window frame,
Her face was patient, sad and sweet,
Her garments coarse and plain;
"Who is she, pray?" I asked a friend;
The red lip gave a curl—
"Really, I don't know her name;
She's some one's servant girl."

Again I saw her on the street,
With burden trudged along;
Her face was sweet and patient still,
Amid the jostling throng.
Slowly but cheerfully she moved,
Guarding with watchful care,
A marked basket much too large
For her slight hands to bear.

A man I'd thought a gentleman,
Went pushing rudely by,
Sweeping the basket from her hands,
But turning not his eye;
For there was no necessity,
Amid that busy whirl,
For him to be a gentleman
To some one's servant girl.

Ah! well it is that God above
Looks u pon the heart,
And never judges any one
By just the outer part.
For, if the soul be pure and good,
He will not mind the rest,
Nor question what the garments were
In which the forms were dressed.

And many a man and woman fair,
By fortune reared and fed,
Who will not mingle here below
With those who earn their bread,
When they have passed away from life,
Beyond the gates of pearl,
Will meet before their Father's throne
With many a servant girl.

Come, Lovely Spring.

Come, lovely Spring, with all thy flowers,
Primroses and violets, come;
Sweet verdure clothe again the bowers—
Bee, let us hear thy hum!
And hearts shall leap, and tongues shall sing,
And welcome forth the new-born Spring.

Thus, e'en as Winter stern departs,
Shall all our sorrows go;
There is the spring-time of the heart,
The spirit's genial glow;
The sun of Hope, with glorious ray,
Drive all the clouds of care away.

Two Simple Rules.

Two simple rules should all observe,
If they would truly live;
Deal justly with each one they serve,
And when they're wronged, forgive.

If by these rules their life they'll guide,
Each heart with love aglow,
Their days on earth will smoothly glide,
True happiness they'l know.

Christian Advertising.

I'm a poor, hard-working farmer, that's never done no harm,
But have labored hard for fifty years to clear my little farm;
And my dear wife has churned, and spun, and toiled with all her might,
From long before the break of day till after candle-light.

We read our Bible, Sundays, and the Christian paper, too;
As our paper recommended some bonds at ten per cent,
I called my woman to me to see if she'd consent
To selling off our homestead, that we might thus invest,
And, living on the ten per cent., to end our days in rest,

Our pastor came to see us, and approved of the idee;
"I'll put five thousand dollars in, 'tis all I have," says he—
"The savings of my three score years, for I am growing old,
And 'twill make me independent while I watch my little fold."

I'm stopping at the poor-house now; somehow my bonds don't pay.
Thank God! my darling did not live to see this dreary day;
For when she heard the neighbors say we'd come upon the town,
It somehow broke her noble heart! she kinder wilted down.

But most of all I pity them who put the notice in;
For how their homeless children must now be suffering!
Their wives must take in washing, and must scrimp in every way,
As the bonds they had such faith in don't somehow seem to pay.

When I heard the old man's story, a vision rose to view
Of splendid brown-stone mansions on a spacious avenue,
And how their pious owners must enjoy the text to see:
"As to the very least of these you did it unto me."

—[G. B. Bartlett, in Christian Register.

The Temperance Picket.

Out on the edge of the cold curb-stone,
In front of a whisky saloon,
She calmly sits in her small camp chair
By the light of the rising moon.

She pays no heed to the passers-by,
As they hurry adown the street;
Some smile, some jeer, some pitying look,
But she patiently keeps her seat.

No breastplate of steel protects her form,
Neither weapons of modern fame;
"Good will to men" is her only shield,
And her watchword is Jesus' name.

She uses no force to keep men back
From those dreadful pitfalls of sin,
But quietly touching him on the arm,
Says, "Please, sir, I would not go in.

"You have a good wife, and children, two,
Who are watching for you to-night;'
Just pass along and gladden their hearts
By turning again to the right."

He stops, he listens, and, with a sigh,
He says in a faltering tone,
"Too true, alas! I will promise henceforth
To let the accursed drink alone."

"Your name, if you please, just write it here;"
And he stoops, in the pale moonlight,
To sign the pledge, then proudly declares
He will be a new man from that night.

One brand is snatched out from the burning,
To life and liberty given—
One soul turned from darkness to light,
And sent on the straight way to heaven.

And still at her post she calmly sits,
As the long, weary hours go by,
The cold March winds blow over her cheek,
And the stars look down from the sky.

The crowd has gone and the street is still,
Save the creaking of a wicket.
And thus till midnight she watches on—
God bless the temperance picket!

H. M. A.

Love.

'Tis never winter in the heart
So long as love remains;
Let snow and sleet around us dart,
A radiant summer reigns.

We brave the cold and have no fear,
We face the storm with glee,
For love is life and summer cheer,
A paradise to me.

Not the First Class.

[Read at the Mad River Valley Grange, Moretown, March 11th.]

"I thought of the Grange, of the use it would be
To even a forehanded farmer like me;
But I found out in season to let it all pass
That the order of Patrons is not the first class.

"I know it is social to meet once a week;
It is good for the farmers, for there each may speak
Of what is his interest, what he has learned,
Or talk of low prices that merchants have spurned.

"I know all of this, but still I don't dare
To send in my V and become a member there.
Now I am looked up to; 'tis caste I regret,
For I might lose in favor with the popular set."

Now these are the words of a farmer I've seen,
Who counts on his acres and does not once dream
That riches take wings; if his should not last
He'd then be no longer one of the first class.

It matters not now whether Granger or not,
The traders may flourish, it harms not his stock,
For when he has purchased, wherever it's been,
Because he is wealthy they'd discount for him.

He takes this advantage to add to his store—
Thinks less of the Grangers than ever before;
His neighbors must suffer, whose profits are less,
No Wonder they're seeking to gain some redress!

We know that the farmers have so much to do;
Their time for improvement is very short too;
They must work on the farm not an hour let pass;
This must be the reason they're not the first class.

As they get fair returns for their labor, 'tis plain
They'll have more time to read and knowledge obtain;
While here at the Grange we may also excell,
Become better informed, and find pleasure as well.

The day is fast coming when farmers will be,
As a class, as respected as any we see;
While the few who by influence their calling disgrace
I think in the Grange would be out of their place.

Let the shrewd politicians, lawyers, traders and all,
Scorn us now if they will, yet while will yet have a fall.
We'll be upright and honest, shun monopolies en masse
And Grangers ere long will be called the first class.

H. M. Montgomery.

Physiology.

If you are about eighteen years of age, you have 160 bones, and 500 muscles; 25 pounds of blood; your heart is 5 inches long and 3 broad; it beats 70 times a minute, 4,200 times an hour, 106,800 times a day, and 36,722,200 a year. About 2 ounces of blood are thrown out of it at every heat; so that it disburses about *seven tons* of that life nourishing element every day. Your lungs will contain a gallon of air, and you inhale 24,000 gallons a day. The weight of your brain is something over three pounds, and the number of nerves upward of 10,000,000. Your skin is composed of three layers, and varies from one-eighth to one-fourth of an inch in thickness, and is subject to a pressure of 15 pounds to the square inch. Each square inch contains 3,500 pores, each about one-fourth of an inch in length, making an aggregate length of the entire surface of your body of 201,166 feet. A tile-ditch for draining the body, almost 40 miles long.

We are sorry to learn that the supposed strong firm of St. John, Abbott & Co., extensive dealers in stock, have failed, with liabilities exceeding $250,000. A meeting of the creditors of the firm was to have been held in San Francisco on Monday. We understand that the firm states that if an extension of time is granted by the creditors, they will be able to meet all demands. The firm has been largely engaged in buying and selling cattle in Fresno, Tulare, Kern, Monterey, San Luis Obispo and San Francisco counties for years, their transactions yearly ranging in the millions. In this county they were noted as the lessees of the Laguna de Tache grant, near Kingston. Among the heaviest losers in this county are Justin Esery and Gilroy & Co., but a large number of others are in for smaller amounts. It is to be hoped that the firm will be able to relieve itself from its present financial embarrassment. The heaviest creditors of the firm, we are informed, reside in San Francisco.—*Fresno Expositor.*

EDITORIAL CORRESPONDENCE.

HOLLISTER, April 19th.

SAN JOSE TO HOLLISTER.

For our own gratification and information, as well as to gather up fresh inspiration from the country for our pen, we have taken a trip southward through the Santa Clara and San Benito valleys; one grand extension of valley lands lying between the coast and Diablo, or Gabilan, ranges of mountains, that join a few miles south of Hollister into broken, rugged, rounded hills, valleys and peaks extending for many miles further south. From San Jose to Hollister the valley is almost continuous—occasionally interrupted by hills stretching out across the level lands to add variety to the incomparable scenery. On either hand are beautiful farms where the land is not monopolized by the Murphy and other grants. Where it is, are broad acres, inviting only to mock the immigrant who would settle; it is virtually fenced against civilization and improvement. What a shame that *such* vested rights are superior to the rights of man, to the earth as to the air we breathe.

The April frosts, together with winds and drouth, gives

VEGETATION

a brown appearance quite discouraging to farmers. But the few warm days lately have given a fresher green, and although a full crop is not possible without rain soon, yet there will be only a partial failure.

GILROY.

Gilroy is a very pretty town indeed, but does not present the appearance of a very flourishing town. There are too few small farms, too much land and property monopoly, and not enough encouragement for enterprise in competition with Chinese labor which the tobacco business has brought into the place. And, by the way, we are credibly assured that this tobacco business is a curse to Gilroy as a town, and of no benefit to the country around; that the tobacco is not of as good quality as it is reputed to be by the influential company that controlls it. The leaves grow gummy in our dry climate, and the flavor is too strong. We are no tobacco man in any sense, but have been observing the movement until we are satisfied we can say no good of it.

SAN BENITO VALLEY.

From Gilroy to Hollister is a fine farming country wherever the land is divided up into farms; but we can never ride through unoccupied tracts held by monopolists without feeling rebellious against a system that will permit such a thing. The crops about Hollister look even better than in the Santa Clara valley. It is evidently not the dry and uninviting place that some have represented it to be.

We had not seen the place in four years, and although we expected to see improvements, were surprised at such evident signs of prosperity. The town itself shows not so much of acquired wealth in expensive buildings as of business enterprise which is the foundation of wealth. The residences are nearly all pretty, one-story, painted houses, with front yards neatly fenced and set out with trees, shrubbery, vines and flowers, just such houses as well-paid mechanics, tradesmen and laborers can own, and which are the best indication of prosperity and comfort.

Years ago, while the valley was still a sheep range, Col. Hollister planted some pepper trees around his residence. These are now fine, large trees, and from them seeds have been planted everywhere, and Hollister is consequently beautified from one end of the town to the other with this magnificent evergreen. There is no finer street or ornamental tree than the graceful (*Schinus molle*) South American pepper tree. It will grow in the dryest places without irrigation but is susceptible to moisture, and in rich soil makes large trees. The old trees here are splendid specimens, and the young ones grow remarkably rapid, as does everything else which is cultivated in this fertile valley.

While this whole region was occupied as a sheep ranch it was thought fit for nothing else. It was not supposed that a crop of grain could be grown in any season, or that it could ever be covered with farms, circling about so flourishing a town. The experience of old Californians who had seen the country settled up in other sections, where it was previously thought to be equally as ill adapted to cultivation, gave a few confidence in this place, but the majority of persons who saw the big sheep ranch were incredulous. The associating who bought it up, divided it into farms 170 acres, with a town laid off into squares and lots, have proven their wisdom, and not only made homes, but in the rise of property have acquired more wealth than years of labor could accumulate. Finer farms cannot be found in the State than some of those about Hollister, so far as good soil, facilities for market and beautiful surroundings are concerned. A few are well improved and many are being improved as fast as the means of the owners will admit. The best assurance of an advancing civilization is that the land is owned in small tracts by actual settlers. On the richest soil near town there are many five and ten acres places cultivated as gardens, orchards, etc., where wind-mills are being erected and homes built. Fine schools, public and private, several and other public enterprises, speak well for the place. The place is only about six years old, and of course everything is new—in fact, in town and out, it is not half grown yet; but is like a promising child.

The branch of the Southern Pacific Railroad that terminates at Tres Pinos, six miles south, runs through Hollister, and over it is transported the wheat and other products that seek San Francisco for a market. A narrow gauge railroad will be built to connect with the Salinas and Monterey road and with the road that will run to Santa Cruz and up the coast.

Not only does an immense section of stock and agricultural lands center upon Hollister as a trading post, but there is lying to the east and south a large mining country, rich in quicksilver and other metals. Its prosperity is not only assured by present developments, but the prospects are all flattering. Hollister's location must always be in its favor. We might give an array of statistics that would be interesting, but these can be obtained elsewhere.

All arrangements have been perfected, and pipe purchased, for bringing water from Picacho creek, about eight miles distant, pure mountain water, to supply the town. The well water is not bad, only a little hard. Upon the top of a bluff-like hill at the north of the town, which commands a view of the surrounding country, will be placed a reservoir.

To-day we have taken a ride among the farms over a portion of the San Benito and Santa Anna valleys. The latter is a small, beautiful valley, nestled among hills, six to eight miles east of Hollister, and covered by some twenty farms—a perfect gem of a valley, such as can be found nowhere else on earth but along our Pacific slope. Here are fine farms of level land, well fenced, and pastures on either side reaching into and over the hills. Grand oak trees, in clusters, afford shade and protection for farm houses and stock, and add much to the loveliness of the scene. In the center of the valley is a school house, the seal that stamps our country to independence and freedom forever. Here are fine fields of grain and flax.

FLAX GROWING

appears to be quite an important matter in this section, and even about Hollister, in every direction. Notwithstanding the dry season, full crops of flax will be grown on many farms. On the farm of John A. Reed is a large field of as fine flax as can be seen in any season in any country. It is the variety known here by the name "California Coast," or "Monterey" flax. It is a tall-growing sort, with fine seeds. Another kind, known by the name of Chili flax, a shorter-growing kind, with plump, large seeds, does not look as well this dry year, but is said to be a fine kind in wet seasons. The best field of flax we saw was sown just after the last heavy rains. But it is the opinion of experienced farmers that, one year with another, it is best to sow as early as possible; the same as with grain, the early sown averages the best. Mr. M. Pomeroy, who has a very fine field of flax, says that some fields will average twelve to fifteen hundred pounds to the acre this season. The late sown will be light, but it is thought the whole average yield in this section will not be less than eight hundred pounds to the acre. There are many fine fields of

WHEAT AND BARLEY

in spite of the dry weather. The extremely cold spell that did so much damage throughout the State had a serious effect here. But, notwithstanding the reputation of Hollister as a dry place, the crops will average very good without more rain, wherever the crops were well put in early in the season, or before the last rains.

The finest field of barley we saw was on the W. P. Phillips farm, sown early on light but rich, well-cultivated soil. The best wheat was on heavier soil that was not plowed over three inches deep, but was very thoroughly plowed with narrow plows and finely harrowed. We find but few adherents to the deep plowing theory. The most of old Californians know better from experience; but none can plow or cultivate too thoroughly or too much when the soil is in suitable condi-

tion. Much land was plowed when too wet; some was allowed to lay in this condition till it was baked into lumps that no harrowing could pulverize. Of course, on such soil only light crops will be produced. Much land was too lightly harrowed after plowing and seeding—merely scratched in. Such shows the drouth, and is spotted. Farmers who are careless, or by trying to do too much do not do it well, are the ones who will be punished.

We saw no summer-fallowed crops, but we found many advocates of the system. The objection seems to be that one can hardly afford to let land lie idle a whole year to get a crop the next, when four years in five a good crop is assured without all that trouble. Several are talking of trying it, though, on about one-quarter of their land another year, "for luck." One thing they are determined not to do any more, that is, to *wait* to see whether it is going to be a good season before sowing their grain. Several who did wait, then sowed after the last promising rain on muddy soil, will have to harvest by pasturing. Had late rains been abundant, the late sown grain might have been the best.

THE PRICE OF FARMS

of 170 acres varies from $40 to $75 per acre. Rich garden spots at San Felipe and near town range from $200 to $400 per acre, in small lots, and are advancing all the time.

AN IMMENSE ORCHARD

of over 300 acres, in one body, on what is called the San Joaquin Ranch, four miles northeast of Hollister, was this Spring set out by Flint, Bixby & Co. There are 65,000 trees in this little California orchard, mostly almonds, but numbering many prune and apricot trees. The soil is gavelly adobe, easy to work, and rich enough for the purpose. With proper care, this orchard will, within half a dozen years, speak for itself. One can ride nearly two miles alongside of it in a straight road.

ARTESIAN WELLS

are being bored in this and adjoining valleys. At San Juan are two fine flowing wells 150 feet deep. At San Felipe are several flowing wells. We saw Mr. Patterson, the well known well-borer of San Jose valley, boring a well on Phillips' ranch. He has gone 410 feet through rich soil, and expects soon to strike a flowing stream. We couldn't help thinking how would some of the farmers in New England like to have 400 feet of soil dropped upon their farms, where stones are the principal crop. But in California valleys, for miles and miles in extent, anywhere from 50 to 500 feet of soil is nothing to be wondered at.

EXTRA VALUE OF FINE OVER COMMON CATTLE FOR BEEF.

While at Hollister we had a long conversation with Mr. Oscar Peck, an old friend and experienced butcher, on the question of comparative values of common and well-bred stock for beef.

Mr. Peck says that Spanish steers five years old will average about 500 pounds dressed weight, while one-half to three-fourths Durham or Devon steers, same age, will weigh about 700 pounds; also, that owing to the heavier hides, more rough tallow, and extra heavy loin and prime cuts of beef, the fine cattle will average worth to the butcher one cent per pound more on foot, dressed weight.

Let us look at the figures. Common beef, the present time, is worth five cents on foot. A five year old fat Spanish steer, 500 pounds, would bring $25. An improved American steer, same age, would weigh 700 pounds, and be worth six cents, or $42—a difference of $17 per head in favor of good breeding. The cost of raising the well-bred animal is no more than the low bred.

Last Christmas Mr. Peck bought six head of Cotswold and Southdown cross-bred fat sheep for $6 per head that weighed, dressed, 120 pounds each. The pelts sold for $2 each. Common fat sheep were worth $3 50 per head at the same time, and would average only 50 pounds each—pelts worth $1 25 each. Any one can figure for himself the superior profit of the fine sheep to the butcher.

If farmers generally fully understood the amount of clear profit there is in breeding and raising only the best breeds of stock, there would be everywhere a demand for the best, and fine breeding males to grade up the common stock would be the order of the day. It costs too much to raise cattle to sell them at low prices with profit. It is what can be realized above cost that counts, and viewed in this light there is at least three to one in favor of well bred stock.

A NEW AND IMPORTANT INDUSTRY.

There has just been established in San Jose an industry that must prove of great importance to California, and of interest to our citizens and all inhabitants of the Northern States especially. It is a dyeing house and tannery for the tanning and coloring of Angora goat pelts and preparaing them for use. Mr. Henry T. Welch, who served an apprenticeship at fancy dyeing in Portland, Maine, his native place, and who has been employed as dyer at the San Jose Woolen Mills some four years, has, after three years experimenting, succeeded in dyeing Angora goat pelts a beautiful, glossy, permanent black without in the least injuring the skins. There has been no difficulty heretofore in coloring the mohair alone with the use of hot dyes, but to color pelts without ruining the skins has been something that no other man in America has succeeded in doing. One or two firms in Europe have dyed furs and pelts black, but even they do not leave the skin strong and soft. Mr. Welch has perfected a process of his own that surpasses anything ever before discovered. The natural gloss of the mohair is not only not injured, but seems to be intensified. The dyes do not have to be applied hot, yet they so permanently color the mohair that no acids alter the color, and even chlorine gas will not destroy the black. Mr. W.'s attention as first called to this matter by some Angora goat raisers who wished to get pelts colored. He experienced no difficulty in coloring any excepting dark brown and deep black colors. His success is the reward of an indefatigable determination and long, patient experimenting.

Mr. McCracken, of Lewis & McCracken, Angora goat breeders, San Jose, has entered into copartnership with Mr. Welch in this enterprise. The firm McCracken & Welch have erected a dyeing house and tannery on the Guadalupe creek just west of the San Jose Woolen Mills, where they are prepared to tan as well as dye sheep, goat, deer, wolf, fox and other skins and furs in any quantity and in a manner that cannot be surpassed in the world. They prefer to tan the skins they dye, as the dyeing process is best commenced before the skin is completely tanned, and when the work is finished it is nearer perfectly done in every respect. But they can color the fur on skins that are already tanned, and finely, too, but it is more trouble to do so.

We have visited the establishment, examined the skins and the tanned and colored pelts, furs, etc., and are satisfied, as is every one who has examined the work, that success is certain.

Now as to the importance of this discovery, it can hardly be over-estimated. There are no prettier or better buggy or sleigh robes than can be made of colored Angora goat pelts. The glossy mohair is heavy and wavy naturally. No better over-coat robes for cold countries can be made of any material. The skins can be taken from the animals as soon or as long after shearing as one chooses, and long or short fur or mohair is the result. We have seen ladies' capes and cloaks made and trimmed with Angora that were very beautiful. There is no nicer trimming than a pure white or black Angora strip from a tanned pelt.

Now that the buffaloes and fur bearing animals generally are getting scarce, the Angora will be found an excellent substitute for many purposes; and now that the breeding and raising of Angora goats on this coast is proved to be a success, and must become a great industry, the matter can at once be seen to be quite important. Half the annual increase of all flocks are males, chiefly valuable for pelts and meat until they are very high grade, when of course the mohair will be valuable for some years before killing. But every goat above a three-fourths grade will make a valuable pelt whether young or old. The market for these beautiful and valuable pelts will be almost unlimited and as wide as the uses to which they may be put.

We will not overlook the fact that the Angora pelts have been beautifully tanned and finished and manufactured into robes for some years by Mr. Eberhardt, tanner, Santa Clara. Mr. E. deserves much credit for his enterprise in this department of his business. He has given much encouragement to the breeders of Angora goats, and demonstrated the wide utility of the tanned pelts. The dyeing of them by Mr. Welch has put the finishing touch to the trade, and as a result a new impetus will be given to the Angora business, and wealth will flow to our State in equal proportion to the demand and supply, which must be continually enlarging.

Along the river, above Sacramento, for a distance of eight or ten miles, there is one vast alfalfa field, some of it standing waist high. The farms here are generally divided off into small fields, and hogs, cattle and sheep kept in the different divisions.—*Sac. Agriculturist.*

WHAT SHALL WE DO WITH OUR IMMIGRANTS?

The question "What shall we do with our immigrants?" is forcing itself upon us as the thousands are coming overland this season. A dry year and short crops will not make the matter any easier of solution. If this country was open to settlement—in other words, if our lands now held as grants and that have been gobbled up in large tracts by speculating land pirates, were open to preemption—there would be a chance for poor people to help themselves. But as it now is they are virtually "fenced out," and left to starve on the highways and byways of our State. The country is broad and beautiful, the climate is genial, the soil prolific, and only needs the hand of industry to make it yield abundantly for all. There is plenty of room for many thousands of homes. But the selfish greed of dishonest men, under a system that allows robbery to run riot, and that protects villainy against individual right in our free country, has brought about such a condition of affairs as gives no encouragement to individual enterprise unless backed up by money enough to buy out somebody that holds titles to the lands. Then again, the State is flooded by Chinese menials who can live upon very little, and who labor for less wages and board themselves than any other mortals upon the earth. There is little demand for intelligent men and women at remunerative wages, to work for those who employ labor. The immigrant is doubly barred out. The broad lands are not accessible without a toll that a poor man can not pay, and his labor cannot be readily sold at a remunerative price in competition with the Chinese. Capital has no soul, and only seeks to aggregate to itself, at the expense of human effort, everything possible. There seems to be but one principle in business, *i.e.*, to make as much money at once as possible. Human wellfare is not taken into consideration. Money is not the servant—does not conserve the interests of man, but is the grand hard master that rules and ruins with inexorable pressure. So terrible is this monopoly that but few persons are willing to devote money to advancing human welfare, even when the probabilities are that it will be returned. Our civilization is predicated upon money; mankind worships it, is a slave to it, and suffers martyrdom for it, to be crushed by it. And for the reason that we are so cursed, our civilization is very nearly a failure. While anything we can say will not remedy the matter, we cannot help deprecating the conditiou, and feeling solicitous for the many new comers who desire to make homes amongst us. The class of people who come here to live are just such as we need to settle up the State, advance the industrial interests, build up schools and further the general prosperity of the whole people. It is a narrow despicable principle that would throw stumbling blocks in the way of encouraging the settlement of this State by making it difficult to get homes and to obtain labor. And it is the evident duty of every one who has a feeling of humanity and patriotism in his bosom to do all he can to remove all impediments and to give all the aid and comfort possible to every family that enters the State to make their homes amongst us.

WHAT ARE GRANGERS GOING TO DO ABOUT IT?

Probably more than one half the immigrants that have been induced to come to California this year have been induced to do so through the representations made by the Immigrant Aid Committee of the State Grange. If there is destitution, want of work, no chance to get homes, and suffering amongst those who are willing and anxious to work and cannot, the Grange will be largely responsible for it. The placing of such a man as Josiah Earl at the head of affairs to take advantage of the necessities of immigrants who, having confidence in the Grange, allow themselves to be directed by him, is a mistake that should be at once remedied.

No member of the State Grange has taken any notice of the investigation of the Committee on swamp and overflowed lands, a portion which we published last month. Why not? If they recognize Mr. Earl as their agent, are they not to be held responsible? We demand of the State Grange to know why they place such men at the head of so important and responsible a position.

We are not at enmity with the Grange. We can never consent to see the influence of the Grange subverted to the uses of the most villainous land pirates in this piratical State to prey upon immigrants without putting in a protest.

The Agriculturist is in every sense a friend to the poor and deserving, and in no sense a supporter of intrigue in any respect. The leaders in the Grange have steered very shy of us. They have never communicated with us, or rather through the Agriculturist to the people, as they have done through several other journals. Honest men are not in the habit of discarding honest means, and we challenge the State Grange Executive Committee to give one honest reason for treating the Agriculturist as unfriendly to Grange principles or as being unworthy of the confidence of honest men.

Every Grapger in this State has a right to know what material the immigrant aid committee, or agency, is composed of, and what it is doing. And it is clearly the duty of every Granger to lend all the aid possible to immigrants, to assist them in obtaining homes, employment and honest treatment. Let your humanity become materialized in good works.

RECLAIMING ALKALINE SOILS.

Experiments and practice in Utah, Colorado, Nevada and California have proven that the way to reclaim alkaline soils is to first obtain a good drainage, then flood with water and leach the salts from the soil. On light soils that water will readily penetrate and drain off through the subsoil, no difficulty has been encountered in producing fine crops where irrigation is applied, from the very first season of cultivation. The alkali, when washed out of the surface soil, is prevented from rising again by irrigation. But let the surface get dry, and as the moisture raises from below the alkali held in solution rises with it of course, and as the water evaporates is left upon the surface.

It is found best to underdrain where the soil is fine and heavy, then irrigate copiously the first year and drain the alkali out as much as possible. As the alkali deposited in lower depths cannot arise unless brought up by moisture, the policy is to keep the moisture from raising either by irrigation or such fine surface cultivation as to prevent the loss of moisture through the surface into the air.

The correct principle once understood, the reclaimation of alkaline soil proves to be very simple. There is no richer soil on the coast when it is once reclaimed and well managed, and it is inexhaustible. Indeed the very alkali is only an overplus of rich earthy salts which would be a fortune to some farms in the East, where there is more acid than alkali in the soil. It seems to us that if some persons we know of, who own alkaline soils, only knew how valuable they would be if once reclaimed, and how easily they might be rendered fertile, they would not let them lie idle in poor pasture year after year, as they do. It would be a good investment for some enterprising man to buy such places and develop them into splendid farms.

SUMMER-FALLOW—REASONS WHY

The want of rain sets many persons thinking about summer-fallowing and how to so cultivate the soil as to best economize the moisture it contains for plant growth. Experience has abundantly proved that crops of grain can be produced on land that has laid fallow a year when adjoining lands that raised a crop will fail from drouth. In seasons of abundant rains it is, perhaps, economy to crop all the ground, or would be if one was oure the following season would also be wet enough. But in this uncertain climate it certainly is policy for every farmer who lives upon such soil as depends upon the rains for moisture, to every year fallow a portion of his farm. He will not be much injured by so doing in good seasons, and will be greatly benefitted in dry ones, as all must admit. We notice that on all lands that laid fallow last year there is promise of fair crops this season. We notice that the prevailing opinion or notion as to why summer-fallowing land helps the next crop, seems to be the idea that *resting* the soil is what helps it and makes it produce. Men whose knowledge of chemistry is very limited will insist that it recuperates the soil to lie so long idle; that gasses in the air penetrate the soil and supply material for new growth, etc. A little of such philosophy is enough. The real reason is simple and satisfactory without such conjectures. Soil which lies fallow retains its moisture through the season, if it is left in proper shape, and, of course, another season's rain added to it fills the soil with moisture sufficient to withstand drouth and make a crop without late rains in the Spring. So far as the rest to the soil is concerned, it needs no rest, and may be cropped perpetually if supplied with water and manure.

On farms that are not very badly affected by drouth, it is found better to rotate crops than it is to summer-fallow. For instance, where grain was grown last year, let it volunteer for hay this, cut early and pasture the balance of this season and next year, then

put in grain again, and the grain crop will be as good as on fallowed land, and the soil will give a return each season. But on very dry soil summer fallow is the only sure method of getting a full crop in any season.

The proper depth to plow when summer-fallowing is another question of interest. We do not think it makes much difference. To plow deep a great expense of power must be used, and even then it will be necessary to have the surface finely pulverized to resist the drying effects of sun and winds and retain the moisture the most completely. Shallow plowing, or thorough surface cultivation without plowing, will answer the same purposes. All that is needed is to make a few inches of light soil for a mulching on the surface, which should be stirred often enough to keep all weeds from growing, and be just thick enough to prevent the escape of moisture from the soil into the air by evaporation.

Some persons have acquired the idea that loose earth will condense moisture from the air, and think that if they stir the soil deeply it will obtain all needed moisture without rain. This is a serious mistake, in our dry climate at any rate. Practice will prove that if you want your soil to dry out fast the best way to do is to stir it deep and often, and science will show you that the dew point in our dry climate is lower than the temperature of the soil in Summer, hence the impossibility of such condensation.

The fact is, we have to depend upon what moisture there is stored in the soil for our crops, and we should see that a sufficient amount is stored there to produce a crop, and then so cultivate the surface soil as to prevent its escape into the air.

On soils that can be irrigated, or that are furnished with abundant moisture from below, as bottom lands are, it matters not so much what is the method of cultivation, so long as the soil is not plowed too wet or allowed to bake.

The object of this article is to show the use and rationale of summer-fallowing from a practical stand-point. If we cannot make it rain, and so make it an object for farmers to take the Agriculturist, we hope to give enough hints applicable to the conditions of our climate to compensate the want so far as we are concerned. There is certainly need enough of a correct understanding of how to treat soils to the best advantage in California, for we find many conflicting theories among farmers concerning this thing.

Not long ago jute fibre was known in Europe only in the form of gunny bags. A paper read by Professor Hodges at the last meeting of the British Association, states that last year 100,000 tons of the fibre were imported from Calcutta into Dundee, while London, Liverpool and Glasgow probably receive half as much more. It was formerly thought that jute could not be bleached, and therefore, that, with all its strength and other good qualities, it could be used only for bags and coarse fabrics. It is only in this raw state that it is worked up in the United States, at least until lately. In Ireland and Scotland the bleaching process has succeeded perfectly giving to the fibre the whiteness of linen fabrics, into which, indeed, it largely enters. It is largely worked up with silk, and makes the best substitute for hair, most chignons being made of it, while the dust from the mills is employed in the manufacture of silk hats. So that jute is largely worn by both sexes.—*Queenslander.*

Hygienic.

Another Physiological Lesson.

BY ALFRED POWER, CHIEF COMMISSION OF POOR LAW, IRELAND.

NO. II—THE BLOOD.

SIX thousand years after his era began
The astonishing fact was discovered by man,
That the blood in his body does not remain still,
But rushes along like the race of from a mill.

Certain vessels called arteries, hidden within
The body, conduct from the heart to the skin;
While others called veins throughout every part
Of the system conduct from the skin to the heart.

The heart every instant gets filled with new blood,
Prepared, as you'll see, from the air and the food;
And this new blood is driven throughout the whole frame,
As from a force-pump, by the force of the same.

The blood in its passage leaves everywhere
Some of what it has got from the food and the air,
Which is all taken up ere a moment is gone,
To replenish the tissue, the fat and the bone.

Throughout the whole structure—bone, muscle and skin—
Where the arteries end the veins begin,
And changing its color from red blood to black,
The blood enters the veins and is so carried back.

When the old blood arrives by the veins to the heart
It is mixed and churned up, in a chamber apart,
With a thick, milky fluid, nutritious and good,
Which the stomach and bowels have drawn from the food.

It is then driven off by a similar force
To the lungs, where the air cells receive it, in course,
Where at every breath it takes up through the skin
The material parts of the air within.

Thus regenerate, vigorous, lusty, and red,
And once more forced back on its fountain head,
To the artery chamber it rushes again,
And is ready to start upon service again.

What we get from the air is equal in weight
To what we derive from the food that we eat;
But what we breath out, I must tell you once more,
Is of poisons the worst, as I told you before.

In a much clearer light you now may perceive
What it's hoped you'll hold fast and devoutly believe,
That for health and enjoyment the very best fare
Is the soundest of food and the purest of air.

Then show that you value your blood and your skin,
Remove every nuisance without or within;
Obey all the laws that are made to that end,
And regard the inspector of health as your friend.

If your house has a taint, employ in good time
Either carbolic acid or chloride of lime;
But of all disinfectants the earth is the best—
Smells covered by earth are forever at rest.

With all these precautions don't fear any harm,
And yield to no panic or foolish alarm;
When the enemy comes be brave but prepared—
Survey your defenses and stand on your guard!

Disinfectants and Deodorizers.

Infection and ill smells cause a great variety of diseases; they both arise from decomposition and decay of vegetable or animal matter, or both. To deodorize is to take away the bad smell. To disinfect is not only to do this, but to arrest the progress of decay, and thus cut off the supply of a bad odor. Our grandmothers thought they got rid of the ill odor of a sick-room by sprinkling brown sugar on live coal or burning tar; this gave a strong and more agreeable odor; it overpowered the other so that it was not perceived, but did not destroy it; both odors were really present, and the air was doubly impure, though more agreeable to the senses. Hence, to deodorize an ill-smelling room or locality intelligently, substances must be used which, by causing a new chemical combination, destroy the odor altogether; but if the decomposition continues to go on, other odoriferous particles begin to arise requiring a new application of the deodorizer; on this account all deodorizers are efficient only temporarily; hence, the only rational method is either to remove the offending material or employ disinfectants which arrest further decay. If the material both arrests the decay and destroys or absorbs the ill smell, then it is doubly valuable. Two hundred grains of chloride of zinc in an ounce of water is a powerful agent in neutralizing bad smells and in arresting both animal and vegetable decomposition, in ships, hospitals, dissecting rooms, cellars, privies, and water-closets, without having any ill smell of its own. For disinfecting purposes, mix one pint of the above fluid to four gallons of water.

There are three powerful disinfectants: carbolic acid, but its smell is objectionable, chlorine and permanganate of potash; these last two are quite expensive. These disinfectants act by combining with deleterious substances and rendering them harmless, while antiseptics prevent and arrest the decomposition of animal substances.

The only perfect disinfectant is habitual cleanliness and thorough ventilation; next to that is a dry heat of two hundred and fifty degrees.

The most common and available disinfectant and deodorizer is copperas, crude copperas, sold by druggists at a few cents a pound under the name of sulphate of iron, one pound to two gallons of water, to be used as often as necessary to render all odors imperceptible, acting at the same time as an antiseptic, deodorizer, and disinfectant, and if instantly thrown over what passes from the body in cholera is one of the cheapest and best means known for preventing its communication to others.—*N. J. Mechanic.*

[The above is a valuable article, and should be preserved. There is far too great neglect of disinfectants and deodorizers. For many purposes the information here given is invaluable. But for all out-door uses, earth—dry earth is altogether the best. The only difficulty there seems to be in introducing it into use is that it does not cost anything and is found everywhere ready for application. If it were found only in certain localities, and to be bought at a price, its merits would soon be recognized. For cess-pools, or out-houses, nothing else should be used. Yet often do we see people going to a distance to buy lime, when three steps would take them to good, loose earth, all ready for use.—*Health Reformer.*

Importance of Wholesome Beds.—Sleep to the working man is emphatically Nature's restorer—reinvigorating the physical system, which through much toil has become weary, and keeping up the flow of life and spirits which are necessary to the performance of the arduous duty of farm-life. A comfortable bed, as we are all aware, conduces greatly to one's rest. On this subject a recent writer says:

Of the eight pounds which a man eats and drinks each day, it is thought that not less than five pounds leaves his body through the skin.

And of these five pounds considerable percentage escapes during the night while he is in bed. The largest portion of this is water, but in addition there is much *effete* and poisonous matter. This being in great part gaseous in form, permeates every part of the bed, mattress, blankets, as well as sheets, which soon become foul and need purification.

The mattress needs the renovation quite as much as the sheets. To allow the sheets to be used, without washing or changing, three or six months would be regarded as bad house-keeping; but I insist if a thin sheet can absorb enough of the excretion of the body to make it unfit for use in a few days, a thick mattress, which can absorb and retain a thousand times as much of these poisonous excretions, needs to be purified as often, certainly, as once in three months.

A sheet can be washed. A mattress cannot be renovated in this way. Indeed, there is no way of cleansing a mattress but by steaming it or picking it to pieces, and thus, in fragments, exposing it to the rays of the sun. As these processes are scarcely practicable, with any of the ordinary mattresses, I decidedly am of the opinion that the good

old-fashioned straw bed, which can every three months be changed for fresh straw, and the tick be washed, is the sweetest and most healthy of beds.

If, in the Winter season, the porousness of the straw beds makes it a little uncomfortable spread over it a comforter or two woolen blankets, which should be washed as often as every two weeks. With the arrangement, if you wash all the bed coverings as often as once in two weeks, you will have a delightful, healthy bed.

Now, if you leave the bed to air, with open window during the day, and not make up for the night before evening, you will have added greatly to the sweetness of your rest, and, in consequence, to the tone of your health.

I heartily wish the change could be everywhere introduced. Only those who have thus attended to this important matter can judge of the influence on the general health and spirits.—*Maine Farmer.*

Purifying the Blood.—Some persons actually read and believe the medical almanacs and advertisements of nostrums that flood the newspapers. How wisely they talk, these advertisements, about the necessity of purifying the blood; but they would lead the ignorant and credulous to think that the only way to get pure blood is to take doses of the particular kind of patent medicine advertised. Many respectable families take it for granted that some kind of spring medicine is necessary to set the human system in working order, as Winter's cold gives way before the approach of warm weather; whereas it is only necessary for them to "cease to do evil and learn to do well" in their daily eating, drinking, breathing, working and playing.

Persons who have learned and pay heed to the laws of health, find no necessity for spring medicines. They are all of the time purifying the blood by their simple daily habits. They aim to make their blood of good nourishing materials, and to "cleanse" it by pure air breathed into the lungs.

It seems to me more and more astonishing that the human body can stand so much abuse, especially in the way of bad air. People shut themselves into such close rooms in Winter, especially at night, that it is no wonder they are driven to all sorts of stimulants to whip up their flagging energies, and no wonder that they are "all run down" at the end of Winter. One of the most common mistakes is the supposition that air is pure in proportion to its coldness, so that you have only to open a door into an unheated room, which is itself a reservoir of foul air perhaps, in order to ventilate sufficiently the living room or sleeping room. But the mistakes in diet alone are sufficient to account for the biliousness that prevails in early Spring. A Winter diet made of fat pork or of hot pancakes saturated with butter or fat, will pretty surely bring some sort of sickness in its wake.—*American Agriculturist.*

Sunlight a Necessity.—Sun-baths cost nothing, and are the most refreshing, life-giving baths that one can take, whether sick or well. Every housekeeper knows the necessity of giving her woolens the benefit of the sun, from time to time, especially after a long absence of the sun. Many will think of the injury their clothes are liable to, from dampness, who will never reflect that an occasional exposure of their own bodies to the sunlight is necessary to their own health. The sun-baths cost nothing, and that is a misfortune, for people are still deluded with the idea that those things can only be good or useful which cost money. Let it not be forgotten that three of God's most beneficent gifts to man—three things the most necessary to good health—sunlight, fresh air, and water, are free to all; you can have them in abundance, without money and without price, if you will. If you would enjoy good health then see to it that you are supplied with pure air to breathe all the time; that you bathe for an hour or so in the sunlight; and that you quench you thirst with no other fluid than water.—*Journal of Health.*

At Lennoxtown, Scotland, a lady has died from lead poisoning. She used, by medical advice, the ordinary seltzer water in siphon bottles, and the water has taken from the siphon such a quantity of lead that it is supposed she received for many days at least a grain a day.

Domestic.

Practical Recipes.

BY MRS. M. E. THOMASSON.

SALT-RISING BREAD.

MANY persons are fond of salt-rising bread and would be glad, perhaps, to have a recipe that can always be relied on. For the benefit of such I send the following: As soon as the fire is made for the morning meal, put into a tin can or other vessel (I like tin best) one quart of warm water, one desert spoonful of salt and one of sugar; stir in enough wheat bran to thicken; place the vessel in a pot of warm water and set in a warm place to rise. The water should be kept quite hot, as a much greater degree of heat is necessary for this kind of yeast than for any commonly used. Be careful not to scald it. In about five hours, or when the bran has risen several inches, strain through a cloth, adding to the liquor salt and warm water sufficient to sponge the amount of flour desired for bread. Keep the sponge warm, and when light, knead and bake in the usual manner. I never use any other bread, and my neighbors often speak of "your good salt-rising."

OPENING FRUIT CANS.

I would like also to tell your readers my method of opening fruit cans, which is very simple and much better than the old plan of melting and gouging wax in order to remove the lids. Hold the can in the left hand, while with the right strike softly and quickly with the handle of a knife on the lid and around the top. The wax will fly off, leaving the can as clean almost as when new, causing no injury to the can and rendering no after cleaning necessary.

Eds. Agriculturist: I am very much interested in the "Domestic Department" of your paper, but am very much surprised how little interest is taken by the women in it. In going around to the farmers' houses, it is a constant source of surprise to me to see how inconvenient the kitchens are, and how much useless labor the farmers' wives and daughters do. Now, I will venture to say there is not five complete kitchens, in ranch houses, in Santa Clara county. And what is more, there is not one out of a hundred women that spend their lives doing house-work who knows how she wants a kitchen arranged to be convenient. There is as much difference in woman's work, between doing it easy and making hard work of it, as there is in a man's using a scythe or mowing machine. Why, even in putting in a sink, where they have one, it is left to the carpenter, so that instead of a low, long and wide sink, with a pitch to drain it promptly, the carpenter puts in a nice little thing, so high as to be inconvenient, and closed up beneath flush with the front, to prevent a person standing close to it as they had ought to to work easy, and so level that the water will be hours running off.

W. A. T.

Miscellaneous Recipes.—*Cream Cakes*—Stir a teaspoonful of salt into a pint of thick, sweet cream; sift in slowly a quart of flour; roll it an inch thick, cut it out with the top of a tumbler, and bake in an oven.

Vegetable Oysters—Put one quart of slicep oysters in two quarts of water, cook till very tender, then add salt, pepper and butter, and a half pint of sweet cream. Serve with crackers.

Rolls—Take a cnp of sweet cream, the white of three eggs beaten to a foam, a teaspoonful of salt rising, and a little salt; mix in a pound of sifted flour with warm milk enough to make a stiff dough. Set it in a warm place, and it will rise in an hour. Knead it into rolls, and bake on a floured tin in a quick oven for fifteen minutes.

Scrap Pudding—Put the scraps of bread, crust and crumb, into a bowl with sufficient milk to cover them well. Cover with a saucepan lid or plate, and put into the oven to soak for half an hour. Take it out and mash the bread with a fork until it is a pulp; then add a handful of raisins and as many currants, a teaspoonful of brown sugar, half a cup of milk, some candied lemon peel, and one egg. Stir it up well, grease a pudding dish, and pour the pudding in. Grate over a little nutmeg, put it into a moderate oven, and let it bake for an hour and a half.

Orange Sirup—Squeeze the juice from the oranges; to a pint of it put a pound of white sugar; set on a moderate fire. When the sugar dissolves put in the peel of the oranges and set the sirup where it will boil slowly eight or ten minutes; then strain. Do not squeeze while straining. Bottle and cork tight. Excellent eaten on almost any kind of a pudding. An excellent sirup can also be made from the peels and pits of peaches; also the peels and cores of those late little sour pears—some prefer half quince and half pear. Such odds and ends can be made use of, and when the wind and snows of Winter are blowing, these sirups are nice eaten on our buckwheat cakes, when otherwise, perhaps, we would be obliged to use black molasses.

Paragraphs Worth Remembering.—Benzine and common clay will clean marble.

Dieting will aid you in removing pimples.

Caster oil is an excellent thing to soften leather.

Spirits of ammonia, diluted a little, will cleanse the hair very thoroughly.

Lemon juice and glycerine will remove tan and freckles, and will cleanse and soften the hands.

Stains on wall paper can be cut out with a sharp penknife and a piece of paper so nicely inserted that no one can see the patch.

A good, cheap paint for floors is made of five pounds of French ocher, one quarter of a pound of glue, and a gallon of hot water. When well dried, apply one or two coats of linseed oil.

A case of death by green wall-paper poisoning has occurred in Louisville, and examination showed that the paper on the wall of deceased's bed-chamber contained two grains of arsenic to the square foot.

Tobacco and Bread.—Bishop Janes stated at the Round Lake camp meeting, last Summer, that it costs the Methodist church more for tobacco than for religion.

The statistics of the Government show that tobacco costs the nation many millions more than its bread does.

Would it not be a sad thing if the heathen, for whose salvation we are contributing men and money, should learn these facts?

Shall those who in some measure realize the greatness of this evil, and are laboring to prevent our young people from being led into its wretched slavery, by the example of church members and ministers, be frowned down by men who are joined to their idols and either cannot or will not reform?

To Soften Old Putty.—A recent writer in *The Garden* says: After many trials, and with a variety of differently shaped tools, with various successes, I at last accomplished my end by the simple application of heat. My first experiment was with a soldering iron, when, to my great delight, I found the putty became so soft that the broken glass could be removed by the fingers, and the putty be easily scraped away. All that is required is a block of iron about two and a half inches square, flat at the bottom, drawn out for a handle, with a wooden end like a soldering-iron. When hot, not red, place this iron against the putty, or flat on the broken glass, if sny, and pass it slowly round the sides of the square. The heat will so soften the putty that it will come away from the wood without difficulty.

Medical Properties of Eggs.—The white of an egg has proved of late the most efficacious remedy for burns. Seven or eight successive applications of this substance soothe pain, and effectually exclude the burn from the sir. This simple remedy seems to be preferable to collodion or even cotton. Extraordinary stories are told of the healing properties of a new oil which is easily made from the yelk of hen's eggs. The eggs are first boiled hard, and the yelks are then removed, crushed and placed over a fire, where they are carefully stirred until the whole substance is just on the pount of catching fire, when the oil separates and may be poured off. One yelk will yield nearly two teaspoonfuls of oil. It is in general use among the colonists of South Russia as a means of curing cuts, bruises and scratches.

The Dairy.

Nervous Cows.

No observing person can have the care of a herd of cows long without noting a great difference in the character and disposition of the different animals. In fact, as Mrs. Partington observed about folks, there is as much difference in cows as there is in anybody, and the feminine peculiarities that we are apt to note in our own kind, may many of them be detected among the domestic animals. Some cows are so phlegmatic and good natured that a moderate amount of ill-treatment does not seem to disturb their equaniuity. Others are naturally vicious, and will kick and hook without provocation, from "pure cussedness." There is another class that, while not vicious, are so nervous that they may easily be made to spear ugly, and in time become really so, in consequence of rough handling or carelessness. It requires a considerate and good dispositioned man to manage such cows and get along with them. They must be humored, spoken kindly to, and gently handled in milking. Swearing at them, or beating them, demoralizes them fearfully, and makes them almost useless in a short time. It is often among the very best milkers and butter makers that these nervous animals are found, and we cannot afford to have their value thus impaired. No violence should be allowed among the cows at any time, but if you have impatient help, or are quick tempered yourself, let some person who don't get mad so easily milk the nervous cows.

Creamery Averages.—The average number of pounds of milk to a pound of butter and to a pound of cheese at the Aville Creamery, Ellington, N. Y., for 1873, was: For butter, 38.056 lbs of milk to one pound of butter, and 12.025 lbs of milk to one of cheese. The net value of a pound of milk was 1.4128 cents.

The habit of being always industriously employed is a great safeguard through life, as well as essential to the cultivation of every virtue.

Apiary.

Most Practicable Bee Hives.

At the Northeastern Bee Keepers' Association, held at Utica, New York, last February, Mr. R. Bacon gave his experience as follows:

It is with hives very much as with mowing machines; the farmer often viewing and reviewing the different machines is puzzled to determine which is the best, yet, no doubt, some are preferable to others. So it is with hives. We see in market tall hives. short hives, narrow hives, wide hives and box hives, one story hives, two story hives, bar hives, and many other hives, and men ready to show you the good qualities of one hive over the other, and when you have gone the rounds, if you have had no practical experience in bee culture or have no judgment of your own, you may be led to believe the poorest hive the best. I would advise the beginner in bee-keeping to use discretion in this matter and take the middle ground. He should choose hives containing frames of convenient size, and safe to handle, for general use. They should not be complicated or costly; they should be capable of construction by any man who is handy with tools. The bee-keeper who does not depend on his hives for support may lay out money for costly and fanciful hives; but the majority of bee-keepers want a cheap, practical hive. I have had rough, cheap hives, and elegant, costly hives, and I have found fn every case, all things being equal, bees have done full as well in my rough hives as in the more costly onces. The wants of bees are few, and they are not partial to fancy hives, and all vsriations from their wants are to benefit or gratify the taste of man. Give the bees a proper shaped hive, and sufficient amount of room in the hive, and good care, and they will give ample returns. Now, there has been much said and written on what constitutes a proper size and shaped hive. Some contend a hive should be large. Others say twelve inches square is the proper dimensions for a standard hive. Now, my experience with large hives has been anything but satisfactory; they neither give new swarms nor a lsrge amount of surplus honey. Of course I speak of working these hives for box honey. I think an extractor would show better results, but my experience in the other extreme of hive has been no better. A hive twelve inches square is too small for bees in any place. The swarms from such hives will be small and generally inferior compared witn swarms from larger hives. There is but little room for surplus bees, and therefore not a very large amount of honey can be expected, and with the best of care in two or three years, the bees will be gone. Between these two extremes, I believe is found the correct medium. A hive sixteen inches long, twelve inches wide and twelve inches deep, and frames to fit, and have it so constructed that side boxes or extractor can be used, if the season requires it, comes nearer to what I think is the hive for general use. The frames are of convenient size, and safe to handle for either extracting or other uses. I believe it is often the case that localities cause very much contention about the style of hive and the management of bees, and were we to consider from each other's standpoint, and reason accordingly, it would save many jangles in bee culture. My frames fit a sixteen-inch hive and are not more thay fourteen inches long and less than a foot deep. They hold the comb perfectly and have no difficulty in breaking down.

Buckwheat for Bee Pasturage. — The right time to sow buckwheat for bee pasturage, in California, is from May to July. When the soil cannot be irrigated, sow in May. If sown then, it not only forms the best pasturage for the bees, but usually yields a good crop of seed. It is one of our best honey-producing plants. The proper quantity to sow to an acre is one peck, although some prefer to sow two pecks. I raise it largely, and succeed best by sowing only one peck to the acre. The number of acres required for thirty colonies of bees will be about four, if it is a good season for secreting honey. I have known one acre of buckwheat to furnish food enough for bees so that 800 pounds of honey and 85 bushels of grain were made from it. This was, however, an unusually favorable season. Five acres are the least that should be sown for the number of colonies mentioned, as it is better to have "too much than not enough."—*Ex.*

The Profits of Farming.

The farmer who resides within reach of a good market, where everything he can produce will command a ready sale at fair prices, and where nothing goes to waste, has a decided advantage over the farmer who lives farther from market and depends upon such staple articles of produce as grain, stock, etc. The perishable articles which he cannot handle yield the largest profits. The advantages of a good home market are well illustrated by the following table, taken from the last volume of the Agricultural Report, just issued. It shows the average cash value of farm products per acre in each State and in the Territories:

States.	Average value per acre.	States.	Average value per acre.
Maine	$14 16	Texas	$12 84
New Hampshire	19 50	Arkansas	17 60
Vermont	17 87	Tennessee	20 70
Massachusetts	31 10	West Virginia	15 04
Rhode Island	34 00	Kentucky	15 54
Connecticut	39 94	Ohio	14 57
New York	22 94	Michigan	15 65
New Jersey	27 96	Indiana	13 51
Pennsylvania	20 80	Illinois	11 13
Delaware	13 24	Wisconsin	14 18
Maryland	15 52	Minnesota	11 38
Virginia	14 15	Iowa	8 49
North Carolina	11 98	Missouri	11 99
South Carolina	10 45	Kansas	8 92
Georgia	11 68	Nebraska	7 74
Florida	11 47	California	15 10
Alabama	13 78	Oregon	16 70
Mississippi	15 61	Nevada	44 30
Louisiana	15 61	The Territories	26 10

The Eastern States, which are not half as productive as those at the West, yield double the returns, in cash, to the farmer; Nevada and the Western Territories, not producing the supply equal to home demand, pay the farmer from two to five prices for all he can rsise, which makes his business profitable. the value of the land must be determined, therefore, not so much by its productive qualities as by its market facilities. The farmer who can get as much money out of ten acres of ground, with half the labor, as can be obtained by his brother from twenty acres, can afford to pay very much for his ten acres. The saving of one-half the labor is not for one year only, but it is a perpetual advantage. The farmer, therefore, who goes far away from market, in order to get cheap lands, will discover that the purchase price of lands should not be considered so much as the market facilities.—*Rural Sun.*

Cribbing in Horses.—"Dr. Cook, of Elmira, Ohio, writes the *Scientific American* that cribbing is caused, in the first instance, either by the front teeth growing so close together as to press and give pain, or by something getting between them, acting as a wedge. The horse feels relief by pulling with his teeth on any hard substance like the side of a plank. Dr. Cook saws between the teeth with a very thin saw, which removes the pressure and cures a bad habit."

The ghost of Noah Webster came to a spiritual medium in Alabama, not long since, and wrote on a slip of paper: 'It is tite times.' Noah was right, but we were sorry to see he has gone back on his dictionary.

Stock Breeder.

Keep Pure Breeds.

MANY farmers make a great mistake by always being anxious to change or cross their breeds. If they would first determine what they consider to be the best breed of cattle or horses, sheep or swine, and then make every movement in improving and perfecting that breed and keeping it in the highest state of purity—it would be far better. Every farmer knows whether he keeps cattle for beef or butter or cheese. If for beef—if that is the main object—the Short-horn is unsurpassed. If beef is the main object and milk a secondry object, still the Short-horn stands first, and every effort should be made to keep it pure, and to improve it, for the purposes for which it is kept. If a high quality of butter is wanted—if this is the main object—Jersey butter commands the highest price in market; and Jersey cows will make more on the same feed than any other breed. The Jersey, then, should be bred pure, and be improved instead of crossing other breeds upon it. The Devon makes good butter and beef, though small for beef purposes; but in hilly countries, where a great deal of travelling is done to obtain subsistence, and where there is considerable exposure, and especially for working cattle also—the Devon stand high. The man who has the Devons should keep them pure, and allow no other crosses. The Ayrshires are highly recommended for cheese purposes. Farmers keeping any of these breeds should get them pure as soon as possible, and keep them so.

The same may be said of all kinds of stock. If you have Berkshire swine don't cross other breeds on them, but obtain pure, fresh blood to them. When you buy, let it be more Berkshires, if you like that breed; and none seems to be healthier, hardier, better grazers, or coming up nearer to the wants of the farmer. If you have the Poland-China, and are pleased with as large a hog as this, and if you are in a fine corn country, you should not cross another breed on them, but buy more of the best breeding stock, to keep fresh blood in it. The same may be said of poultry. Instead of keeping two or three or half a dozen varieties of poultry, keep one, and keep it pure, and try to have the best of anybody. It is always disadvantageous to be obliged to shut up poultry in yards. They want exercise, fresh air, a variety of food. They can secure those better, if allowed to go whithersoever they choose, than to be shut up in close yards.

One of the advantages in keeping stock pure is, you can sell it for five times as much, when kept pure, as you can, if constantly crossing, so you can't tell what you have got. This is the course breeders are pursuing, and one farmer can become a breeder of pure fine stock, as well as another. It is admitted that skillful breeders are making money. Let every reader become a skillful breeder of some kind of stock. It is no more trouble than to be always crossing. Aim at excellence as a breeder, and you can reach it with the proper effort.—*Rural World.*

The above advice is correct inasmuch as it applies to the breeding of pure stock of any kind. But while it pays to breed pure stock alone, it also pays to mix pure blood with common stock and grade it up as fast as possible.

Here is another definition of a thoroughbred, which is worthy of remembering. "A thoroughbred animal is the offspring of a dam and sire, each of five uncontaminated crosses, and a half-thoroughbred must have a dam or sire that is full thoroughbred. A full blood animal is one of which the sire and dam have each uncontaminated blood of the same strain."

To Fatten Cattle.—We clip the following, by R. A. Steele, a prominent stock raiser of Kansas, from the *Drover's Journal.* If stock raisers could and would be guided by it, the quality of cattle sent to market would be rapidly changed:

The price of cattle fattened for market depends on the symmetry of the animal, as well as the fat style, as shippers term it. I want here to state that good blood is important, but not absolutely necessary to make what is termed a good seller. In order to fatten a steer to bring the highest market price, he must be kept in a growing condition from a calf, and in no case allowed to go hungry. It is the starving the first and second years that wilts and shrivels up a steer, that causes him to be sold at a reduced price. No amount of feeding will make him a first class seller, no difference what his color or blood. An animal well fed (I care not what the blood—Texas or not) from a calf until he is three years old, will be smooth, with bones well covered, and will sell at a profit; while a half starved animal becomes crooked in the back, bones projecting and shriveled up, takes the best part of the Summer to get in a condition to live, and will not be in a condition for market until he is four years old, and then will bring a price which is unsatisfactory to the producer, and to every one that handles him. This is no theory, but a fact, deduced from close observation, as I have tested the plan for several years.

It will, and does pay to feed corn to calves and yearlings. They start out on grass in the Spring strong and vigorous. You are then able to market your cattle the Spring they are three years old, weighing 1,400 pounds, which is heavy enough to bring the first price. The best steer I sold in 1872 was a common native. He had all he could eat from a calf, and was never hungry. He was a handsome animal, and worth more per pound than anything I shipped in 1872. He weighed in Chicago 1,350 pounds; age, three years. I have a steer calf eleven months old, from a very ordinary cow. The calf in May weighed 660 pounds. I think it will weigh, when three years old, 1,500 pounds. I do not wish it understood that I am not in favor of improving the blood as well as feed.

I shipped two Texas steers this Spring, which were three years old. They were smooth and nice, and I sold them with a lot of Durhams four years old at the same price, and they were worth as much per pound and weighed better according to age. They were raised and fed by different parties.

Mammoth, overgrown steers have had their day, and we now come down to the neat, compact, well fattened animal, both in hogs and cattle. To accomplish this in cattle, good feeding from a calf is necessary.

Dogs and Sheep.—One might ask, why don't you kill off the dogs? The reason is a simple one; a farmer's dog often saves him his crop. Dogs have been used so much for the protection of grain from stock that especially in the past they have seemed indispensable. As a solution of this question, however, an exchange suggests the following: It is a well established fact that bells on a flock of sheep is a preventive against the ravages of dogs. A half-dozen or dozen small, clear-toned bells to fifty sheep would be sufficient. Added, kill every dog suspected of depredating upon them.

Scrub Stock.—"What is 'scrub stock?'" asks a correspondent of the *Rural New Yorker.* Whether this question is asked in good faith or not—whether it is sent in "just to see what we will say," or not, we propose to answer it: and our answer is that it is any kind of stock which does not pay maximum profits for keeping and feeding. In other words it is that kind of stock which is not *the best* for the purpose for which it is kept.

Stock Pays All the Time.—The heading of this article, says the *Valley Farmer,* was the remark of an old farmer the other day, while deploring the failure of his wheat crop. "One year the wheat fails, another year the corn; but," says he, "stock pays all the time." He, moreover, remarked that the farmers who early gave their attention to stock raising, had gone right along without setbacks, and had outstripped the grain growers.

There is, no doubt, much truth in the old man's remarks. Stock is the surest and most remunerative. But in thickly settled regions it is better and safer to divide the interest between the two. The two assist each other and improve the farm. Waste straw and offal of the stock go far in fertilizing the soil and improving its capacity for productiveness. The strength of the soil is a great desideratum with the farmer. The soil is the mine of wealth—his treasury—his bank of deposit. He must keep it good, or his paper is protested; his reputation as a farmer is dishonored.

It is well to keep a variety of stock as well as to raise a variety of grain crops. The general profits of each year are thus kept nearly equal. Farming may be done closer, less wasted and more made.

In Southwestern Texas, there is a cattle raiser who has lived there twenty years. On going there he picked up a dozen cows and branded them. He had no land, but was the possessor of a wife, two or three children, and a few dogs and two or three horses. He kept watch on his cows and lived in a hand-to-mouth way several years, sustaining his family by the capture of game and the sale of skins. In May, 1873, he owned 30,000 head of cattle, duly branded, and ranging over the plains. He has a family of nine children, five of whom are boys.

His eldest child is a girl, nineteen years of age. She can rope a steer, kill a wolf with a rifle, or untangle a dog at arm's length. As the man's house is a nail keg, nearly filled with gold coins, while in the pantry is a flour barrel almost filled with silver pieces. When he sells cattle it is for coin which is dumped on the premises. He will not take paper money at any rate, but is always ready to sell steers for gold or silver. The house occupied by this prosperous family is low, built of logs and contains three rooms. The father and mother sleep in the dining-room, the girl sleeps in the spare room, while the boys sleep in the addition.

Those who are giving their attention to the breeding of pure blooded Norman Percheron horses are on the road to wealth. Perhaps no subject has been spoken of so often as the matter of choice of animals for breeding purposes. At the same time there is no doubt but that the mass of our farmers to-day are heedless of this important matter. Why is it that the cry is made to-day that there is no money in raising horses? Simply because our farmers do not accept as a fact that "blood will tell" and that it costs but a trifle more to raise a horse that will be worth from $200 to $400 when he is four years old than one that it is hard work to sell for $75. —*Fine Stock Gazette.*

Says the *Fine Stock Gazette:* Ponder over this showing, you wheat-growers who have mortgaged your farms for machinery. Four thousand seven hundred and fifty hogs, weighing 1,440,400 pounds, were shipped from Iowa City, Iowa, during the month of January, averaging $6 30 per cwt. Thus a nice little $84,445 is brought right into one community in cash, and of course cannot fail to put that community, financially, in much better circumstances than its neighbors who have had no faith in swine-growing.

When an animal has been grown upon correct principles, it is at all times merchantable, and the addition of flesh to almost any required amount is very simple.

The Horse.

Breeding Horses for Use.

PROBABLY there is less money made by raising horses for sale than in any other stock. It is only occasionally that a young horse will bring enough when sold to pay for raising him. We do not advise horse-breeding as a money-making business, but only for use. It does pay a farmer who has use for horses to keep at least one span of mares of such breed as suits him to raise colts from. The mares can do just about as much work during the year as they ordinarily would if they did not raise colts. There are seasons when they would be at rest, and a sensible farmer will so manage that the colts will be foaled at a time when it will least interfere with the usefulness of the mares for work.

Occasionally, a man can make something by raising fine trotting or running stock, but seldom indeed; and on an average there is more time and money spent fooling with such "fine stock" than they are all worth put together, even at their fictitious values.

That the most useful horse is the most valuable one from a common sense stand-point of values, there is no disputing. The farmer who tries to improve his working and road stock is on the right track, whether he pleases the jockeys or not.

And right here we want to call attention to the superiority of good walking horses over those of slower gait. Everything else being equal, fast walkers are worth twice as much as slow walkers, for farm work especially, and for any kind of teaming.

HARDY COLTS THE BEST.—Good care of colts does not mean keeping them in the stable, unless it be during storms. A colt can be made tender and awkward if it does not have the full benefit of out-of-door exercise and romping over fields and pastures. Good feeding is a necessity to rapid growth and and complete development, but without that exposure and freedom that gives hardiness and nimbleness a colt cannot become a perfect horse. Don't make the colts tender and dumpish by confinement when they are growing. Give them a chance in the full air and sunlight, and inure them to some endurance of fatigue and change of weather. But feed them well and train them in the way they should go.

PERCHERON AND NORMAN HORSES.—Within the past few years quite a large number of stallions of these breeds have been brought to this country. The preference of most of our breeders is given to them decidedly over the Clydesdales, and they are used with grand success upon mares of all breeds and sizes. Even the little Indian Pony mares will bear a great Percheron stallion's foals, which, as yearlings, are as large, or larger, than themselves, and it is abundantly proved that size is not an essential qualification in mares to produce large colts by these horses, contrary as this is to the views which prevailed a few years ago, namely, that the best system of breeding was to put big, roomy mares to well-knit and compact stallions smaller than themselves.

The demand in all our large cities now for heavy, quick-stepping draft horses, a pair of which will step off with five tons over a good pavement, is so great that our farmers must be awake to meet it. Such teams will bring $800 to $1,200. They ought not to be put to hard labor before they are five or six years old; but from the time they are three until they are old will do all the farm work and not feel it.

As this style of horses increases in the country, the desirability of keeping the mares for breeding, will lead to our using heavier teams for farm work which will be greatly to our advantage.—*Ex.*

ENDURANCE OF EASTERN HORSES.—Australian horses, unprepared, unshod, and uncared for, are in the constant habit of performing forty, fifty, or even sixty miles a day, when on a journey over roads or through the wild native bush, without even a track. Their food consists of what they can pick up for themselves, in many cases when tethered to prevent their straying, and their grooming in having the rough mud rubbed off with a bunch of grass; but they have at least one advantage over poor *Caradoc* in being allowed to ease and rest their limbs in whatever manner they choose during the night. It is stated, on the authority of Abdel-Kader, that Arab horses will travel for three or four months at the rate of over fifty miles a day without showing fatigue, and are capable of doing 150 miles in a single day during the journey, if treated with care and quietly ridden the next. Some years ago, an Arab, only fourteen hands, one inch high, was ridden in India 400 miles in five days for a bet; and its owner offered to repeat the feat after one day's rest. This offer, however, was not accepted, as the game little horse won the match the first time with the greatest ease.—*Land and Water.*

A Public sale of Percheron horses took place at Onarga, Ill., February 10th. An average of $2,055 each on the ten young stallions disposed of was obtained.

Pisciculture.

How Fish Spawn Can be Hatched.

AMONG the many interesting things at the exhibition of the Central New York Poultry Association lately was a new contrivance for carrying and hatching fish eggs, the invention of A. Green, brother of Seth Green, the famous Father of Fishes. It was a plain compact box, not over fourteen inches square, which contained trays about one inch in thickness, placed snugly one over the other, and filling the box completely full. The bottoms and tops of the trays were composed of Canton flannel, and the cost of the whole is but a trifle. The fish eggs are placed upon the flannel, one layer in each tray, and it is only necessary to keep the flannel moist to secure the desired result. The eggs can be hatched in fifty days or in one hundred and fifty, just as the owner desires, the length of time necessary being governed entirely by the temperature of the place in which the hatching box is kept. If the flannel is kept slightly moist, the process of hatching goes on, whether the box is located in kitchen, cellar, pantry, garret or parlor, just the same as if the eggs were in a hatching house, creek or river. When the eggs show signs of life, the trays can be put into a pan, those that are wiggling upon their own account can be brushed off into the water or allowed to paddle away, and the remainder can be replaced in the box and hung upon a nail until evidences of other lives appear. Several of the trays were in the pans at the poultry exhibition, and the visitors were greatly interested in seeing the young fish break out of their eggs and swim off with the sacks which give them nourishment for thirty days and longer.

HOW OYSTERS ARE BORN.—Prof. Lockwood, in *Popular Science Monthly*, says: Our bivalve, however, does not spawn after the manner of mollusks generally. It is in its own way viviparous. It does not emit eggs; but, at the proper time, sends forth its young alive. The eggs are dislodged from the ovaries, and committed to the nursing care of the gill and mantel. At first, each egg seems to be inclosed in a capsule. It is of a yellowish color; but, as incubation or development progresses, this color changes, first to a gray, then to a brown, afterward to a violet. This is a sign that the time of eviction is at hand; for Nature now issues her writ to that effect. And wonderful little beings they are when the writ arrives to vacate the homestead; for whole troops of them can go gracefully, and without jostling, through the maziest evolutions in that tiniest sphere—a drop of water.

As cited by F. W. Fellowes, in the *American Naturalist*, says M. Davaine: "Nothing is more curious than to see, under the microscope, these little mollusks travel in a drop of water, in vast numbers, mutually avoiding one another, crossing each other's track in every direction, with a wonderful rapidity, never touching, and never meeting." The parent oyster has, indeed, a prodigious family to turn out upon the world. But when this time does come, though Winter be near, her actions are summary, and the wee bairns are every one ordered from home. They are spit forth, or ejected from the shell. Filled with water, the valves are suddenly snapped together. Every snap emits a small, whitish cloud. Though a little of the milky fluid be in it, this whitish cloud is composed chiefly of the tiny fry; for, individually, they are almost invisible. Indeed, who shall count the oyster's offspring? Science, by her own methods, has made the computation, and so she gives us the astounding assurance that a single oyster, during one spawning season, emits two million embryos!

Seth says he has been experimenting upon this process since 1855, but never hatched spawn to his satisfaction. While he has been busy in taking care of the general improvements in the matter of fish culture with great success and much benefit to the world at large his brother worked out the problem, and Seth gives him all the credit due his invention, for which a patent has been asked. The Greens find that they can hatch 1,000,000 fish eggs by the use of a single pail of water. Brook trout, salmon trout, white fish and salmon all grow finely in the box. They have carried 100,000 salmon trout from the New York State hatching house to the Pennsylvania house on two trips. In one trip seventeen were found dead, while but two died on the other. Spawn can be carried on a journey of 130 days with good management, and no more loss than is sustained in the hatching house. This appears to be the invention necessary for transporting the spawn across the ocean to Europe. With it there could be no failure like the one which occurred recently upon the first trial trip.—*Utica Herald.*

TROUT AND WHITE FISH.—B. B. Redding, of the Fish Commissioners, and J. G. Woodbury, their Superintendent, took to the Summit from Berkeley 15,000 young brook trout, half of which were to be planted in the North Fork of the American river, at Soda Spring, and the remainder in Prosser creek, which empties into the Truckee. These trout constitute one-third of the number hatched at the State hatching establishment at Berkeley from 50,000 eggs from New Hampshire. The rest have been placed in streams in different portions of the State. One hundred thousand white fish eggs arrived a few days ago from the Government hatching establishment at Niles, Michigan, but a large number had hatched out while *en route* and died. The young fish obtained from the eggs remaining will be introduced into Tulare lake. A large number of white fish were planted in Clear lake two or three years ago.—*Record-Union*

Seth Green and His Work.—The name of Seth Green will always be an honored one on this coast; and the Isaac Waltons of California will cause it to be revered and esteemed among their children. Although many may have created more agitation and acquired more notoriety, yet few have accomplished such substantial and enduring good as Mr. Green. The results of his labors will last forever, and their benefits extend and multiply with time. Mr. Green has recently read an address before the National Fish Culturists' Association of New York on fish culture, which is replete with useful suggestions on the subject to which he has devoted so profitable a life. He speaks of the things which can be accomplished in the matter of fish transplantation, and says of New York that all its used-up shad rivers can be stocked again and made as productive as in their best days. Mr. Green relates an entertaining experience of how he was in Washington in 1868, and hatched a few shad in the office of General Spinner—he of the wonderfully and fearfully made autograph. He told the General that with twenty-five thousand dollars he could stock the Potomac with young shad, and in three years they would be as plentiful as ever before. And the honest and plain old Cerberus of the Treasury tried to get members to vote the appropriation; and when the plan fell through was one of the "maddest men" around the Capitol.

The speaker alluded to the discouragement he had met with when he "went to the Connecticut and Hudson rivers and told the people he was going to hatch shad eggs, and make shad plenty and cheap." Everybody hooted at him. Some thought he was a rogue, while others, more charitably tempered, thought he was only a lunatic.

Mr. Green, in conclusion, lays down the very sensible proposition that the work of fish planting "should be kept out of politics." That when fish commissioners have acquired by experience a knowledge of the business, it is a great mistake to remove them and fill their places with new hands. And finally, he urges, "the State appropriation should be made so small that it will not be worth while for any shark to go for it."—*Vallejo Chronicle.*

The California Fish Commissioners, says the Alameda *Encinal*, have established a fish-hatching institution at Berkeley, on what is known as Strawberry Creek, especially for the benefit and edification of the students of the University, where they may learn the habits of the finny tribe free of cost. The hatching house is under the supervision of Mr. Woodbury. The ova of 60,000 brook trout was placed in the hatchery about six weeks ago. Of these, some 50,000 have already been hatched, and 12,000 placed in Alameda Creek, and branches, 3,000 in the Maraguna Creek, and branches, and the balance distributed in the northern waters of the State. The Commissioners are now importing the ova of the white fish in large quantities, through Professor Baird, President of the United States Board of Fish Commissioners. Soon the State of California will rival the most favored fish country in the world. Every new variety seems to thrive in our waters.

The jute cloth which enters so largely into the manufacture of grain bags in this country —especially in California—is mostly made at Dundee, Scotland, where there are 59 immense mills, one of which employs five thousand workmen, engaged in the manufacture. It is estimated that ten per cent. of the value of the California wheat crop is expended in the purchase of coarse jute, cotton and linen bags.

The gentleman who asserted that his friend never opened his mouth without putting his foot in it, being called upon to apologize, said he was very sorry, but when he made the assertion he did not know the size of his friend's foot.

Poultry Yard.

Brown Leghorns.

THERE is no denying the fact that the Brown Leghorns are fast becoming a most popular variety, both as a fancy and a useful breed. They are small, mature quickly, the hens come into laying early, and for that reason are profitable. They are easy keepers, being small feeders and prolific egg-producers. They have all the markings and build of good layers, having large combs and wattles, of a beautiful pinkred color, which is always suggestive of fresh-laid eggs. New beginners are apt to be discouraged at first, but experience teaches the virtue of patience and perseverance. I have learned that one must first raise his layers from good stock before he can expect even a moderate return, and fowls purchased from noted breeders are not always reared with an eye to this important advantage. It is sufficient for them that the breed has a name for producing eggs. Fowls for this purpose must be raised, not made—must have the very best of care and feed, from the shell up, to establish the foundation of a strong, vigorous constitution, in order to support rapid and long continued production, as well as to reproduce stamina in their young. I have every reason to believe the Brown Leghorns will do this and amply repay their own with a good supply of large, fine eggs at all seasons of the year; but there must be a large outlay before expecting a return. The chicks of the Brown Leghorn are hardy—as much so as any variety. The chicks require a certain amount of care until they are six or eight weed old, and by experience I find this rule to hold good with all breeds and varieties of poultry when in an artificial condition. The Brown Leghorn chicks possess the virtue of feathering early, and thus escape much danger which awaits their featherless brethren, the Black Spanish and Asiatics. The markings of both the Brown Leghorn cock and hen are beautiful—indeed, splendid plumage is a marked characteristic of the breed.

The day is long since past when the questions "Do hens pay?" "Are they profitable?" are undecided. I have had many years' experience, and can answer that I know they do. From the long list of debits and credits, I find the balance in their favor. The hen business (if the expression be allowable) is healthy, pleasant and lucrative; but one must in some measure be born to it (not made), with a fondness and interest in nature, a close, observing eye, and a mind willing to inquire into and search the mysteries of nature in her own fields, and learn the truth of the unmistakable knowledge she teaches her children; and where pleasure is born, the money value ceases to exist, and the profit accrues; thus labor becomes only a healthful exercise. To one about establishing a poultry yard, I would advise them to put down the Brown Leghorns on the list as a good variety, not only for their useful qualifications, but for beauty and ornament.—*Country Gentleman.*

Dark Brahmas.—Much has been said lately about this useful and popular fowl. My opinion is that there is not a more thoroughly useful fowl in existence. As a proof of what I state, allow me to make a few remarks.

A friend of mine who is quite well known as a Brahma breeder, has this year reared sixty-one chickens. The first brood consisted of eleven, from eleven eggs, turning out to be six cockerels and five pullets; this lot of chicks were sixteen weeks old on May 31, and on that day a pair (cockerel and pullet) weighed exactly eleven pounds. Three of the five pullets commenced laying at fifteen weeks old, and laid nine eggs during the last week. These two facts are quite sufficient to prove the qualities of the Brahmas, not only as a rapidly growing bird, but also as a good layer. Some of your readers, perhaps, may say, "Ah! but this is only a solitary instance." In answer to that I state the following: The same breeder's birds in 1871 commenced laying at seventeen weeks old. In 1872 the pullets commenced laying at sixteen weeks, and this year a week in advance. The gentleman to whom I allude is Mr. W. Mansfield, of Cambridge, and I have no doubt that the forward condition of his birds is simply due to the high feeding and good attention which they receive at his hands.

A few more remarks and I have done. No man can breed good fowls without care and trouble, but to be really successful he must have a knowledge of the habits and wants of the varieties he cultivates, which takes a long time to acquire. I have bred different varieties, but have found the Brahmas equal, if not superior, to all.—*Cor. London Field.*

I would like to give your readers a little of my experience in the matter of raising poultry hoping thereby to give some useful hints. I began with the Brahmas, and for market find them and others of the Asiatic breeds the best. But for egg-producers give me the Leghorns. I find their eggs, from their size and color, attract buyers much more readily than the darker and smaller eggs of the other varieties.

To the general farmer, I recommend a cross of the White Leghorn and Light Brahmin or White Cochin.

I give my fowls, for feed, a mixture of wheat bran, ground oats, and cornmeal, scalded, three times a day, and occasionally mix it with bone dust.

I now have about 1,500 chickens on my farm a few miles from the city. I have finally settled on two breeds, the Brahmas and the Leghorns. I divide my chickens into three lots, having a shed for each division. I do this because I think they are less liable to disease. As a proof of this I can say I never had a chicken die of the cholera.—"*Reader,*" *in Prairie Farmer.*

Cocks' Combs as Food.—The combs of Spanish and Leghorns fowls are sold in some parts of Europe as choice delicacies for the palates of those who sigh for fresh appetizers. Under the name of "Cretes de Coq," a supply of these morsels has been recently imported hither from Paris. The combs are of large size, both single and rose, and are put up in white vinegar, in long tubular glass bottles, holding about a pint, sealed with black wax. When we say that these small bottles cost at wholesale in Paris more than a dollar in gold each, the reflection is forced that many a large combed rooster may in future be sacrificed to Mammon, as many were offered up to Esculapius There are enough large combs in the yards of some of our breeders to make a fortune if they could be utilized. We hope, however, the combs on the Mediterranean class will be reduced in size, as many large ones amount to positive deformity.—*Poultry World.*

Guinea Fowls for the Table.—The Guinea fowl is the richest and most palatable of all our domestic poultry. We can remember of no game bird among the Gallinæ that surpasses it, and when our grouse and partridges and prairie chickens become extinct, as they will by-and-by, the Guinea fowl will prove a perfect substitute for them, and as it breeds freely and requires but little care, it will be practicable to breed it in all sections. After the bird attains an age of two years it needs some other process of cooking than by roasting, but with an age of less than two years, a roasted Guinea fowl will discount anything else in the edible line we can raise.

In Sweden, gardening forms a part of the educational system. Upwards of 2000 schools have gardens for planting attached to them, and the teachers of elementary schools are obliged to learn gardening.

Porcine.

How to Tell the Age of Pigs.

IT the various exhibitions of stock, where care is taken to test the correctness of the certificate of age by an examination of the teeth, pigs occupy a somewhat invidious position, inasmuch as they are always suspected animals. Disqualifications on account of the discrepancies between the state of the dentition and the age stated by the exhibitor are of constant occurrence, and outsiders are compelled to conclude either that the dentition of pigs is very irregular, or that those who have charge of the animals are singularly inexact in their reckoning. Certainly, the pig is not to blame, for the changes which take place from birth to the completion of permanent dentition at eighteen months are remarkable for their regularity. Comparing the statements of the older writers on the subject of dentition of the pig with the facts which have been recently noted we may conclude that an improved system of breeding and feeding has had great influence in advancing the development of the teeth; but whatever was gained in this particular reached its culminating point years ago, and for some time past we have noticed that the exceptional cases have been in the direction of retarded rather than premature development of the teeth.

At birth the pig has the temporary tusks and the corner incisors well up. These teeth are very fine and sharp, almost like fine needles, and occupy a position on each side the mouth, leaving a clear space in front. In a month to six weeks the central temporaries are cut, and soon after the completion of the second month the latteral incisors are cut, and the animal has its full set or temporary teeth, including three molars on each side, top and bottom, six incisors, top and bottom, and a tusk on each side, top and bottom. At the age of six months the premolars, which occupy a position between the first temporary molar and the tusk, are cut, and also a permanent molar, which is fourth in situation. The premolars are not always present, and in their absence the fourth molar will be accepted as an indication of the age of six months. At nine months the permanent tusks are cut, and the corner permanent incisors, which often prick through the gum soon after seven months, are fairly up. At one year old the central permanent incisors take the place of the temporary teeth, and the fifth molar is also in position.

Many pigs at the age of twelve months retain the temporary central incisors, and we have met with no instances of the permanent centrals being in their place before the full age of a year; hence the fact of these teeth being well up in an animal which was certified to be under one year, would disqualify it. At fifteen months the three anterior molars are permanent, and they may be easily recognized by their recent appearance, and by the absence of any signs of wear. At eighteen months the permanent dentition of the pig is completed by the cutting of the last molar, and also the external permanent incisors.

After this period it is seldom necessary to define the age of the pig, nor is the evidence which is afforded by the growth and wear of the teeth sufficiently exact to enable the examiner to form a positive opinion.—*London Agricultural Gazette.*

The Berkshires.—David Z. Evans, Jr., thus speaks of this breed in the *Live Stock Journal:* The Berkshire breed of swine is much esteemed, and deservedly so, for its many good qualities. One of its chief recommendations is its freedom from most diseases, particularly skin diseases, such as mange, etc. With precisely the same management, I have seen the white breeds become mangy, while the black one remained perfectly healthy, with the skin soft and smooth. Besides this, they do not consume as much food, proportionately, as most other breeds. To illustrate this, I will give the average feed of some of mine. I have pigs weighing from two to three hundred pounds, breeding sows and boars, which get for their daily feed three good sized ears of corn and three common pailfuls of thin slop, the slop made of six quarts of wheat middlings, or corn and oats. This constitutes the food for each, and produces as fine specimens of this breed as can be found. The reason for this is, I believe, that they assimilate all the food given them, are quiet in disposition, and when kept growing from the start, can be kept in extra order with only a moderate amount of food. Of course when they are growing—that is, when they are not taken from the sow until they are about ten weeks old—we give heavier feeding to sows, with as much green food of different kinds, in its season, as they will consume readily, making the lesser proportion of different kinds of grain.

The best specimens of Berkshires have small, shapely prick ears, are heavily hammed, and rather heavily jowled, with broad shoulders and a square, short, broad nose, with the forehead sometimes dished. In selecting a boar or sow for breeding, look for hams as heavy as possible, as the broad and deep shoulders are more easily found. The straighter you can get the back, especially on the hams, the better the pigs; and avoid one, particularly a boar, which has shelving hams, or a back drooping rapidly from the fore-hips to the tail. I like a good chest, as it denotes strength of constitution, a thing which, I am sorry to admit, has not been considered by many breeders of thoroughbred stock.

In regard to dish-faced Berkshires, they are very hard to find, and yet harder to breed. The best specimen, perhaps, which I ever saw of this kind, was a two-year-old sow, exhibited at the Middletown (Del.) fair, last September. She was imported from the queen's pens, England, and had one of the finest formed heads possible. Many breeders are striving to produce this form of head, but mostly without success.

Feeding Swine in Summer.—A correspondent of the Germantown *Telegraph* writes: My own experience of pork-raising, based upon experience, observation, and probably a little philosophy of things, if written for the benefit of others, would be about as follows: During the hot Summer months I would feed very little solid feed, such as corn in the ear or uncracked. I would keep hogs upon green feed constantly, either grass, oats or rye, and feed them at regular intervals, once or twice a day, upon mashed feed, either shorts, chopped oats or rye, buckwheat, etc., feed in troughs. When fed in this way and at the same time allowed access to water and shade, hogs will bear rowling through the hot months, a very good time if not the best, to take on flesh. This puts them in the best of condition for corn feeding, which should commence about the first of September, when the new crop is still soft and tender. Treated in this way hogs become probably as perfect as any method could make them. Upon the whole, I believe it the cheapest and most economical.

Cost of Preparing Pork for Market.—The charges for slaughtering, cutting and curing the hog product, and for smoking, packing, canvasing the same, in the city of St. Louis, are about as follows:

Hogs slaughtered for slaughter house offal.

Cutting dressed hogs, curing and rendering the lard, "exclusive of salt and cooperage," 25 cents per 100 pounds, hook weight.

Furnishing salt for curing green meats, in bulk, 25 cents per 100 pounds meat, bulk weight.

Packing barrel pork, furnishing salt and pickle, 75 cents per barrel.

Packing hams in tierces, furnishing sweet pickle $1 per tierce.

Sugar curing hams, in open vats, ready for smoking, one cent per pound.

Cooperage furnished at market price.

Storage free on the product to March 1st.

Offal from dressed hogs sold free of charge and proceeds credited to the owner.

Smoking, 25 cents per 100 pounds, weight out of smoke, including fifteen days' storage.

Packing bacon and bulk meats, in casks, "exclusive of package or salt," 50 cents per 1,000 pounds.

Packing bacon or bulk meats, in tierces or boxes, "exclusive of salt, package or paper," 35 cents per package.

Packing bacon, in gunnies or bales, "exclusive of bags or paper," ten cents per package.

Re-packing pork, including pickle, fifty cents per barrel. Extra salt and barrels necessary furnished at market price.

Cleaning bulk sides, one and a half cents each; bones sold and proceeds credited to owner.

Canvasing and washing hams, furnishing all material and one month's storage, one cent per pound.—*Rural World.*

Hog Items.—The pig is a social animal, and generally will fatten faster in company with other hogs than when kept alone.

Pigs, to thrive well, and be healthy, where full fed on corn, should have plentd of salt, sulphur, and wood ashes, where they can run to it and help themselves. Bituminous or soft stone coal will furnish the sulphur, and is quite valuable for hogs; feed it by throwing in a shovelful or two at a time in its natural state only breaking up in pieces the size of a walnut.

The usual practice in the management of hogs is to keep the whole stock for fall killing, through the previous Winter. In this practice lies, perhaps, the secret of want of success in hog keeping. The most economical method, we are inclined to think, would be to keep sows enough to have the whole stock of pen hogs come about the first of March, to be well prepared with roots, a lot of rye or or other early pasture, and a clover field, to furnish both sows and pigs with full supplies of succulent food from the start, and throughout the season. Such management may bring any tolerable breed to a weight of 150 to 175 pounds, by the middle of December.

The *Journal of Agriculture* says: When corn sells for 15½ cents per bushel, pork costs 1¾ cents per pound.

When corn costs 17 cents per bushel, pork costs 2 cents per pound.

When corn costs 25 cents per bushel, pork costs 3 cents per pound.

When corn costs 33 cents per bushel, pork costs 4 cents per pound.

When corn costs 50 cents per bushel, pork costs 5 cents per pound.

This may be correct when hogs are fed on corn alone; but where hogs are raised on pasturage and stubble fields, it costs but little to grow and fatten them.

The Value of a Thoroughbred Boar.—A breeder's circular says that "the thoroughbred pig, in starting a herd, is chiefly valuable in breeding the common stock. By using a thoroughbred boar upon common sows, you get a half-blood that does very well for feeding purposes, which can be further improved by selecting the best sow pigs, feeding them liberally, and again getting a thoroughbred boar and using on them, which, if practiced a few years, will produce porkers equal to the pure blood. But graded or impure males should never be used, as the tendency is to run back to the scrub. The thoroughbred, if purchased young, can be had for from $25 to $30 each. He can be used one season, and sold or castrated and fed, when he will of

himself almost or quite pay for his original cost.

At first thought, to many, the price for a pure-blooded pig may seem high; but, really, it is better to pay the price than let your sows go to a scrub for nothing. Say you pay $25 for a boar, and breed twenty-five sows. They will raise, say, one hundred pigs, which is a low estimate. The pigs then cost you twenty-five cents apiece, and will make hogs that will weigh at fattening time one hundred to two hundred and fifty pounds more than scrubs (which grade pigs will do on the same feed). You have, therefore, an increase of value from $300 to $700 in one year, with the price of pork at $8 per hundred, and you have your boar left. Can you invest your money at a larger per cent.?

Correspondence.

Notes of Travel, and Ideas Upon Health Subjects.

BY MRS. C. F. YOUNG.

WOODBRIDGE,

San Joaquin county, about two miles from Lodi Station is a quiet little rural town of about fifty families, two stores, two smith shops, two hotels—how many saloons this deponent knoweth not,—one school house, one Odd Fellows' and one Masonic hall. The last is used by the Grangers, who number, it is said, seventy-five. There are not any church buildings nor temperance societies, and yet material prosperity is evident in every direction.

The people are largely Southern. They are everywhere proverbial for the real comfort they get out of a little. Low-eaved, rambling houses, with projections, or boxes, added for an extra bed-room or closet, without regard to architectural effect, but "very convenient and handy" for the women folk inside; low ceilings; wide windows; broad, open fireplaces; grassy, sodded door-yards, with bunches of sweet-smelling herbs, loved because reminders of the long-ago homes of childhood; a few chickens; the sleek, petted cow; the gentle old horse—all these things are evidences of contentment. You, doubtless, dear reader, are thinking that a

GRANDMOTHER

would complete the picture. Yes, she is here—or they are here—trembling, gray-haired, loving old ladies. No one but a grandmother could keep every nook and corner of house and yard so scrupulously clean and neat. In all these semi-Southern settlements aged people are found abiding in their own homes, having sons and daughters settled around them. Blessings always attend those who "honor their fathers and mothers.

PROSPERITY.

Several long walks brought to view wheat fields, substantial buildings, good fences and other evidences of prosperity. We judge mixed farming is quite popular. Cows, hogs, sheep, poultry, etc., are not seen in large numbers; but a few to be seen in each of our long walks indicate the value placed upon them. There is only one drawback with these people: they are afraid of strangers, and pin their opinions too much upon the sleeves of their religious and political leaders. It is not possible for *one* man, or class of men, to have *all* the truth. Even a woman may have a truth to tell worthy of credence, which, accepted, would preserve bodies and elevate souls.

THE WORLD MOVES,

and the people with it, in spite of their prejudices. One half our people live too fast—the other, too slow. When will the golden mean be found? The slow half tell us "it is wicked to study physiology; children will learn enough without being taught how bones grow!" The fast half say "it is wicked to have children." They truly know too much. Off of these extremes the drug and quack doctors thrive. Every ailing on the one hand calls for the doctor or his drugs; on the other side, crime is committed, the houses are childless, cold, silent, and—oh! what blighted, wasted women abide in them! Angels pity them! How can they hope for heaven in the hereafter? If the Press is a power in the land, then let the

PRESS INSTRUCT THE PEOPLE,

warning young women and men of the hidden reefs and terrible quicksands. The surface may be ever so smooth in a calm day when you jointly contemplate these untried waters, but—woe, woe, woe to the frail barks that tempt the turning tide.

YOUNG MEN

and women of California, we entreat you, study well these questions. Seek mutually to know the whole truth. Entering into marriage, be sure you are ready and fit to assume its responsibilities. Each one of you gladly accept hints and promptings in reference to the improvement of farms and stock. Will you not try to live each twenty-four hours of your lives temperately, purely, chastely that the children of your love may also be born in

THE ASCENDING SCALE?

How to so live that we may drop out our bad qualities and intensify the good in our nature, is one of the vital questions of the age, imperatively demanding the closest, most conscientious attention of every adult citizen. The gibberish and raving of the inmates of a private asylum for the insane, within a stones throw of our open window, attest the importance of this question. Poor, helpless, ignorant enslaved women—wives while yet children. Wretched unbalanced men, lost through lack of simplest physiological knowledge. How long: O, Lord, how long before knowledge shall run and not *be* glorified, but be permitted to glorify the people receiving it?

"Honor to Whom Honor is Due."

Eds. Agriculturist: We are often given, in speeches and papers, for the edification and encouragement of our boys, glowing accounts of how penniless lads have risen, by their industry and perseverance, to wealth and influence, position and fame. We are told how Benjamin Franklin, a printer-boy, by his industry and frugality, rose to be the eminent philosopher and statesman we all unite in styling him; how Horace Greeley became the foremost journalist of his time; how bankers, railroad kings, merchants, senators, Governors, etc., who were, while quite boys, thrown upon their own resources, to battle against the stream of life alone, have, by their energy and diligence in whatever calling they were engaged, gained for themselves wealth and honor. All this is good, and we are ready to accord all due honor to the men who have so boldly and successfully striven against misfortune and adversity. We are glad that we have such examples of self-made men to point to. But there is another class of men more deserving of honor, we think, than these. The world knows little or nothing of them and, because they have not amassed fortunes, seems to care less. That they have fought just as manfully, been just as industrious and frugal in their habits, equally as noble and worthy (if not more so) in their characters, seems not to be a matter of notice, so long as they have not acquired the same success—wealth. Let us say a word in favor of one of this class. We have not far to go to find him. He is a poor tradesman in our city. Yes, *poor*,—not because he has been an idler or a spendthrift, a drunkard or a gambler, a slow or incompetent workman, but because he had not an opportunity—if he had the desire—to save his earnings. His parents were poor, and it required more than the father could gain by his daily labor to provide his family with the necessaries of life. From the time the son entered his apprenticeship his wages, too, small as they were, were required to help supply his sisters and brothers with bread. After his apprenticeship expired, he went to another town and diligently wrought at his trade. But from here, too, he sent his earnings home to those whom he knew were in need of his help. Nor did this stop when he had arrived at his majority. No, the burden only increased. Now his father, an old, gray-haired man, was unable to do his accustomed part, and the care of the whole family fell upon the shoulders of the son. For years this state of things lasted, and the young man is still poor in the world's goods, but rich in the blessing of those who have had so large a place in his heart.

This is no picture of the imagination, but a true statement; nor is it an isolated case by any means—we have many such men among us. If Mr. Franklin deserved the greater praise for having cut wicks and run errands for a chandler, then surely this man should be honored, for often the people in an Eastern village have seen him, after returning from school and on Saturday, standing in the snow trying to earn a few cents by sawing wood. Mr. Franklin might resolve to "save one-half of his wages," but this poor lad must invest *all* his scanty earnings in another way. And yet his love and care for his home is no credit to him in the sight of a cold, cheerless world—if he is poor. Out upon such a verdict! All honor, *we* say, to such men. Those who have honestly gained wealth and esteem by their worth and industry, are deserving of credit, truly; but the self-denying, noble poor man who has spent himself in his love and care for others has a still greater claim to our honor and praise. The world may not prize his virtue and worth, but such men are the nobility of our race. Because they had not the opportunities of others, they are none the less praiseworthy.

When we raise our voices in eulogy of the successful men who were once errand boys, let us not forget those noble men who began a little lower and fought equally a good fight, though they are not senators, or have not stores of wealth as the fruits of their labor.

> "There are springs of crystal nectar
> Ever swelling out of stone;
> There are purple buds and golden,
> Hidden, crushed and overgrown.
> Crumpled shirt and dirty jacket
> May beclothe the golden ore
> Of the deepest thoughts and feelings;
> Satin vest could do no more.
> * * * * *
> "God, who counts by souls, not stations,"

does not honor so much for success, as for the earnest, pure effort. Let our boys be taught that the acquirement of riches and fame is not the *summa summarum* of success in life. Let them know that we prize higher than all else they can attain to sound principles and noble natures, and encourage them in their efforts in this direction by trying to bestow our praises where due. VOICES OF THE WORKERS.

THE NEWSPAPER OVERTURNS THE WORLD.

Politics and Religion in the Granges—No. 2.

BY A. GAYLORD SPALDING.

As before quite clearly explained, politics has two very plain and distinct features. One is proper, commendable, and everywhere applicable, relating to the business affairs, commerce, and social arrangements of men. The other is narrow and sectional, disturbing and corrupting the morals and the peace and welfare of society. This latter kind is wholly incompatible with Grange principles, and is therefore rejected from the Order.

Religion, too, is open to the same criticism. There is the true and the false, the practical and the speculative. Religion is natural, and no nation is found without it—being manifested according to mental and moral development. But the sectarian quality cannot come come into the Grange for obvious. The element of principle and humanity is not its all-pervading power. It cuts the people up into antagonizing factions, under senseless creeds and names, and consequently curses while it blesses the world.

THE FAMILY GROUP

of parents and children is a natural and beautiful order of all grades of the human race. Each family is a home, and most happy and heavenly may it be. No such bliss exists elsewhere on earth. The Grange is devised and organized after the family pattern, in larger groups. [Is not "a family in a larger group," *with children left out*, an anomaly?—Eds.] The idea is exceedingly simple and practicable, and most intelligent, perfect, and attractive. No unselfish farmer or workingman can fail to appreciate and accept it. Hurrah! then, for the Granges! Multiply and speed them over the wide continent. Every interest of society comes under the head of politics or religion, which must be freely and fairly discussed, and fully understood. Ignorance is our ruin.

THE BATTLE OF THE GRANGERS

is for labor reform, against a crushing moneyed aristocracy. Old parties and sects are all under the leadership of such an aristocracy—a combined money power with social position and office-holding. They claim their privileges as the rightful heritage of the upper-ten class, on the ground of custom and precedent; and the brute force of sword, cannon, and bloody armies stands ready to defend them, while the working muscle of the common people is ground up for their use. It is a world monopoly of ages, which a world co-operation of Grangers and Sovereigns must overthrow. It is the battle of Armageddon.

THE MONOPOLY AND CORRUPTION OF POLITICS

in our country is well represented by such men as *dis*-Hon. Bill King, of Minnesota. How he gobbled up the votes in his district, by the power of Durham bulls and subsidized newspapers. He won the election, but is bound to hang himself, Judas-like, as a compensation. Shame on the people, and shame on the newspapers. They hang *themselves*, effectually, by such voting and disgracing the ballot-box.

THE SECTARIAN MONOPOLY

and aristocracy is powerfully and proudly represented. Money unstinted is invested. But that first-class Brooklyn scandal, though a black disgrace on civilized Christendom, will fortunately do very much to break the yoke of sectarian thralldom on the working class. Thousands of similar cases may exist around us, but they are plebian, and fail to come to the surface, or get into the newspapers. The character of our much-boasted civilization may be judged by our police gazettes as well as by the quality of high functionaries. What Indian tribe can show a worse moral record? Yet we send abroad our pious missionaries, and talk of exterminating the Modocs, and actually hang them!

OUR COMMON RELIGION

is threadbare with formalism. The religion is bid away too far. It is sky religion. The Grange brings things down among the people—into their houses and home. A heaven right here at our door is far more convenient than one up in the moon. How long will it take to make earth a paradise by devoting a hundred and fifty millions to splendid church buildings in New York, while ninety thousand stout men there are unemployed, with no potatoes in the cellar? A million years won't do it. And yet that is the sectarian method all round, and party politics join in to help it. It is a religion of professional aristocracy, with Andover kid-glove graduates to pound and expound in velvet-cushioned desks. But

THE TRUE GRANGE RELIGION

is better suited to the wants of plain, homely and sensible workingmen.

> "He who knows our greatest needs'
> Reeks not man that counts his beads,
> For righteousness is not in creeds,
> Nor solemn faces;
> But lies rather in kindly deeds
> And Christian graces."

We may well expect a blissful heaven in a future life; but the important work of the Grangers now is, to avoid the hell of monopoly and aristocracy and political damnation. Some contend that good men should stick to the old parties and sects in order to purify and reform them. But clearly that is bad logic and poor philosophy, for a man can never lift himself into a basket while standing *in* it. And, as our new wine of reform needs new bottles to hold it, so we must stand outside of the basket and outside of old parties and sects if we would lift them up. It requires a machine more powerful than any stump puller in the country.

THE GRANGE MOVEMENT,

then, is no mixture and no compromise, but an entirely new departure, out and out. Not in party interest of any kind, nor sect; but it is a fanning-mill, a sifter, that is to separate the cockle and chaff of politics and religion, saving only the clean wheat of *principle*. That is the farmer's gold. We may now discard old names altogether, and be known only as the Grange party. Then nothing is left ambiguous, but all is distinctly understood and boldly outspoken.

No dependence for reform can be placed in any but actual and responsible workers. None of your lily fingers, that seek the easy places and shirk the hard. That style of business is playing out. That is what spoils church and state, and sets them tumbling. We are told a hard story of the carpet-baggers at the South; and however true, the North is sprinkled over thick with carpet-*beggars* in the shape of dandy peddlers and traveling agents for patent speculations, to gain quick and easy fortunes, and avoid the sweat. Thousands graduate from our colleges and strive to stand in public desks and professional offices because such positions are easy, genteel, and well paid. But the money comes out of farmers and workers. Two-thirds of the professional men in the nation are so many two-legged grasshoppers—and worse than the little famine-breeding insects, because they (the two-leggers) stay by, and *eat all the time*. They are always on hand for such fancy things as require the least toil. They are popular dead heads. But we find the true emblems of trust, honor, manliness and national prosperity are the ax, hoe, spade and plow, with "hayseed in the hair."

THE PRINCIPLE OF FRATERNAL UNITY

and co-operation is fundamental in the Grange. This not only kills all monopoly, but it will wipe away that old red dragon of gory war—that most fearful and universal scourge of mankind. Government officers and military men, under our present violent order of things, are interested in the plunder of battle fields, and would therefore be slow to accept any doctrine of permanent peace. Their trade is war. But when all shall become Grangers and Sovereigns, then human carnage will be forced to stop. Othello's occupation will be gone. So roll on the glorious Grange ball round the world. Roll it along!

WOMAN SUFFRAGE.

The woman question now fills up the book. We speak of the Grange as a family order; but no family is without a woman. She is mother, wife, sister, and does a great deal wherever she is. In the hive, she is queen; in sickness, she is the best nurse; and she can tend the baby better than "any other man." If we sleep well at night, a woman has made the soft and downy bed. Every man is proud of his table when a charming lady pours the tea. Where woman is, there is sweetest music and the perfume of roses; and where happiness and love dwell, surely woman is not far away. Then, would not all these beautiful things be represented in her vote? Indeed they would. Good government is not wholly made up of bull dogs, swords and guns, and the noise and smell of gunpowder. And the still, small, gentle voice of woman's ballot could certainly do no harm, could it?

CHAMPLIN, Minn., April, 1875.

Harrowing Wheat.

The uniform testimony of all those who have tried harrowing wheat in the Spring is, says the *Rural World*, that it pays. One subscriber says: "I have acted upon the advice given by you, and I find the result at harvest most satisfactory. I began the custom by harrowing fifteen acres, or about one half the usual number of acres that I sow. My neighbors, who had never seen it done, insisted that it would kill it out. I shall continue the practice, as I have now procured one of the Thomas smoothing harrows, which, in a great measure, enables me to dispense with the roller, which I still use, however, when the early Spring is an unusually dry one. I think by using the harrow that the wheat tillers—that is, stools—out better than when it is not cultivated in the Spring."

Another subscriber writes as follows: "I find that harrowing wheat in the Spring pays well. It gives the wheat a good start, and the harrowed portion ripens as early as the unharrowed part, and has heavier seeds."

DR. HABEL has arrived at the conclusion, after mature study, that guano is not made from the excrements of sea birds, as has been hitherto supposed. Chemical treatment has disclosed an insoluble residue composed of fossil sponge and marine plants, and animalculæ. Hebel's opinion is that guano is made of fossil remains of which the organic matter has been transformed into a nitrogenized substance while the mineral constituents have remained unaltered.

Household Reading.

Words of Council With Parents.

EDS. AGRICULTURIST: Notwithstanding my short acquaintance with your paper, I feel an earnest desire to draw my chair within the "domestic circle" and say a few words to parents.

I have often desired to be an able writer, that I might employ a style of composition so charming in its power of persuasive eloquence that parents every where, and in every condition, would be forced to realize their great responsibility. I am frequently astonished at the manner in which parents (good people, too) regard the welfare of their children. They will talk eloquently about what observation and experience have taught them as regards their horses, cows and pigs, but seldom will a word be uttered in reference to family culture. The little ones that God has committed to their keeping, with the solemn injunction to carefully train, are permitted to grow up in a way to suit convenience. Not because of lack of love—oh, no; but because the trials and burdens of life are suffered to creep in and obscure the path of duty. How many poor, tired and overworked mothers there are who, in order to indulge in the unlimited extravagances of the age, are forced to expend all their time and energy in the vain and unprofitable endeavor to serve the body, while the mind is left neglected.

How many weary, anxious and perplexed fathers there are, too, who are trying in all sorts of ways to reach a higher round in life's great ladder, regardless of consequences. O! the confusion, the turmoil and strife that beset us all in our journeyings up and down. No wonder that He who planned this mysterious ladder, and set each round in wisdom, should have so earnestly warned us of danger. Then be careful, fathers and mothers, guard wisely and well your sacred trust—your homes—your children. Can there be anything more beautiful than a perfect home—a spot more sacred than her domain—a gift more precious than little children?

Mothers, to you especially is a noble work intrusted. Begin it early. Let your little ones feel that you trust them fully. Entertain and instruct them. Converse with them, and encourage them to talk with you. Many a child grows up hard, unimpressible, unloving, simply from the imposed silence in which the first years of life were spent. Remember, too, that innocent amusement is the very life of childhood; that too much restraint is productive of evil. Teach your children to confide in you, to counsel with you in the most trivial affairs that concern them.

But, perhaps I have trespassed sufficiently for once, therefore I will conclude my remarks at some future time. M. E. THOMASSON.

A MOTHER'S INFLUENCE.—Who can measure the influence of a mother on the young and immortal minds of her children? Her looks, her actions, her smiles, or her frowns on her children stamp impressions on their minds which will last forever. She gives a moulding influence to their character, their course of life, their temporal and eternal well being. They rise to the glories and happiness of heaven, or sink to the woes and ruin of a lost eternity, much according as the mother trains them up for God, or allows them, through neglect, to grow up in selfishness and sin. The mother sits at the threshold of their existence, and directs their first tottering footsteps. Her duties lie at the foundations of human society, and from these young springs of life, flow out in all their after existence, streams of bitter or sweet, purified or poisonous.

FALSE DELICACY BETWEEN MOTHERS AND DAUGHTERS.—As young girls near the boundary line where childhood and womanhood meet, there comes a natural, wondering interest as to the diferent relationships they see around them. This curiosity being the voice of nature, imperatively claims satisfaction, and if the mother does not give it legitimately the child will be only too likely to gain it from sources of whose very existence she is ignorant, simply because to her they are superfluous.

There are thousands of mothers who will talk with the kindest unreserve to those not bound to them with any tie but that of friendship, who yet feel the most false and foolish delicacy with their own daughters. I *know* this to be the case. A great many young girls have come to me for information and advice on personal subjects, whom an unnatural reserve kept from applying to their own mothers. I know it again *by experience*. I found it much harder to do my duty in this respect to my own daughters than to the daughters of others. And yet the duty is an imperative one, which requires to be attended to both much earlier and more positively than was necessary in your own case. For assure yourself of one thing, that the knowledge which came to women half a century ago only as the result of experience, is ready now at every street corner and in every kitchen for your little girl, as answer to her first wondering intuition.

Nay, while she still nurses her doll and wears her childhood's aprons, all the mysteries of human nature are questioning her innocent heart. Who is to answer her? Will you leave her to soil her white soul with the filthy fancies of dime novels, or still worse books. Is some servant girl, lewd and ignorant, to usurp her mother's holy office, and defile the sacred sanctuary of your home? Or will you with calm and reverent wisdom lead her into the "house of life," and show her how "fearfully and wonderfully we are made."

Will you not, then, explain to her that this human "body is the temple of the Holy Ghost bought with a price," and that it cannot be defiled, even by an impure thought, without sinning against Him who cleansed it with his own precious blood, making our bodies "members of his own." Such teaching is necessary to keep her morally healthy, and if you can succeed in inspiring her with a profound reverence for purity of soul you have done very much to secure her health, her intellect, and that joyous, cheerful abandon which, though the glorious privilege of natural girlhood, is, alas! every year becoming more rare.

But this first primary instruction neglected, what follows? Physical abuse and degradation. A war against nature which gradually makes your child (born a little lower than the angels) below the beasts of the field.

I am quite aware that this is a very delicate subject, as well as one of the saddest of social problems. But ignoring an evil does not annihilate it. And the anger of those whose false refinement forbids them to speak of things it does not forbid them to do, or the scoffing of the vulgar and light-minded will not deter the serious and benevolent from its consideration.

Physicians see the mighty evil filling our lunatic asylums, robbing marriage and paternity of all its divinity, digging myriads of tiny graves for infants born of parents too enfeebled to give them enduring life, and most of them with a groan of pity "pass by on the other side."

There is no doubt, however, that the great majority of young people now slaves of the most repulsive habits might have been saved had their parents early explained to them the eternal laws of nature, and their intimate connection with "whatsoever is lovely and of good report." And farther, it is also the duty of parents, *having instructed, to watch* until virtue has acquired the strength of habit—of habit whose foundations are laid in piety and knowledge.

Slow, insidious, unsuspected, suicide is becoming a household crime. Children make their own coffins day by day, and parents are either ignorant or indifferent to the fact. Against this sin physicians must become active missionaries, for their words, weighted with knowledge, will have an irresistible influence.

But prevention is always better than cure. And, therefore, mothers and daughters should have but one heart, and fathers and sons walk together as friends.—*Mrs. A. E. Barr, in Science of Health.*

A CHEERFUL HOME.—A single word may disquiet a whole family. One surly glance cast a gloom over a whole household; while a smile, like a gleam of sunshine may light up the darkest and weariest hours. Like unexpected flowers which spring up along our path, full of freshness, fragrance and beauty, so kind words, gentle acts, and sweet dispositions, make glad the home where peace and blessing dwell. And the influences of home perpetuate themselves. The gentle grace of the loving mother lives in her daughters long after her head is pillowed in the dust of earth; and fatherly kindness finds its echo in the nobility and courtesy of sons who come to wear his mantle, and fill his place; while on the other hand, from an unhappy, mis-governed and disorderly home, go forth persons who shall make other homes miserable, and perpetuate the sourness and sadness, the contentions and strifes and railings, which have made their own earthly lives so wretched and distorted.

Toward the cheerful home the children gather "as clouds and as doves to their windows;" while from abodes of discontent and strife and trouble, they fly forth as vultures to rend their prey. The class of men that disturb and distress the world are not those born and nurtured amid the hallowed influence of Christian homes—but rather those whose early life has been a scene of trouble and vexation, who have started wrong in the pilgrimage, and whose course is one of disaster to themselves and trouble to those around them.

Labor-Saving Machinery.

The saving in the operations of husbandry by the use of modern implements and methods is equal to one-half the former cost of working. By the improved plow, labor equivalent to that of one horse in three is saved. By means of drills, two bushels of seed will go as far as three bushels scattered broadcast. The plants come up in rows, and may be tended by horse-hoes; being in the bottom of little furrows, the earth tumbles down against the plants, which is not so readily heaved ont by the Winter's frost. The reaping machine is a saving of more than one-third of the labor when it cuts and rakes, and will eventually save fully three-fourths when it is made to bind automatically, as it shortly will be. The threshing-machine is a saving of two-thirds on the old hand-flail mode. The root-cutters for stock in England, and in some places in the Northern States and Canada, much reduce the labor of Winter feeding. The saving in the labor of handling hay in the field and barn by means of horse-rakes, horse hay-forks, etc., is equal to one-half. With the exception of a grain drill—which had a precarious existence previous to 1776—all these improvements have been commenced and brought to the present relative perfection within the century now closing.—*Harper's for December.*

The only objection to the female chaplain of the Maine Legislature is that she has too much to say.

Butter will remove tar spots. Soap and water will take out the grease stain.

Educational.

A Parody for the School-Room.

BY DWIGHT C. PIERCE.

To know—or not to know—that is the question—
Whether 'tis nobler in the mind to suffer
The evil consequence of ignorance,
Or to go to school; and, grasping new ideas,
Dispel the old ambiguous fogs and mists
That so bewilder the untutored mind;
And, by dispelling end them?—To learn—to know—
And by judicious study say we end
The thousand gross mistakes and tedious ills
So oft occurring—'tis a consummation
Devoutly to be wished. To know; to learn;
To learul perchsuce to 'xplain:—ay, there's the rub!
For as we make the attempt, what dubious thoughts
And shadrous principles present themselves,
In duli confusion, mixing all we know;
Aud ere we shuffle out the right idea,
We make a pause. There's the respect
That makes an explanation live so long;
For who would take the long and crooked route,
The mountain climb, or plunge into the gulf,
Or puzzle over the debate of authors,
Or bear the whips or scorns of time thus spent
To bring before the mind but one idea,
When he himself might his mental nake
With shorter method? Who would yet submit
To be the slave of ignorance and doubt,
But that the dread of being in the rear,
The butt of ridicule, or something to
Be learned, puzzles the will; and makes him bear
The ills in consequence, rather than toil
To learn the truths he yet knows nothing of.
Thus apprehension oft retards our course,
And thus the youthful mind is oft dismayed,
And lost, amidst the mass of human woes
That by pernicious ignorance is swayed.
And should I close by thus portraying ill,
'Twould leave the matter none the better still;
For when you're sick should the physician say,
Your case is very bad, indeed; I pray
To know what good might thus be done; if he
Did not prescribe and give the remedy?
So I would say to all who tim'rous are,
To nobly struggle, break the iron bar;
'Tis education frees the mind of man,
And teaches him the universe to scan.

Taking Agricultural Papers.

If there is any one thing that a farmer should always make a necessity, it is a good agricultural paper. We know there are a large number of farmers who think they cannot afford to pay the price, and who think it is money thrown away; but we will venture the assertion that no farmer will ever lose anything by subscribing for at least one paper devoted to his interests, and in ninety-nine cases out of a hundred, if he will only read it carefully, he will find it will pay a thousand per cent. profit.

We do not propose to say that he must follow everything that he reads, but use his own judgment in all cases. What may be a success in one particular locality, may under other circumstances and in a different place be an entire failure. But, taking the year round, and reading the fifty two numbers the farmer will receive, he is sure to find more or less that will profit him; he will find in a very short time that he will look upon his weekly paper as a necessity, and one that cannot easily be dispensed with. If the farmer has boys whom he wishes to raise up intelligently they must have something to read and instruct them—something that will induce them to try new experiments themselves, and see if, by care and work, they cannot better their stock and grain. Love and learn is what we want. One of the best ways to help your boy to make a good farmer is a good, readable agricultural paper, one that works for the farmer's interest, and is practical and reliable. Every other branch of trade has its weekly or monthly paper, and the farmer should have his. Just the same as every other branch of trade has its organization, so the farmer should have his. But these different organizations would not have half their strength were it not for their weekly and monthly papers, which circulate among them and inform them of what is going on in their particular branch of trade.—"*Farmer,*" *in Rural World.*

Common Sense.—It has been said, in another form of expression, that the slightest excess of expenses over income is poverty, and the slightest excess of income over expenses is wealth. The ability of practical farmers to master this great problem of life is not so much dependent upon what they know of their business as upon the faculty to apply what they know. Success in business is due to the administration. Capacity in administration is due to the faculty, power, or quality called common sense, which everybody speaks well of and nobody understands exactly. We infer its presence or its absence from the results of a man's life. We venture upon the definition of the phrase we are using, not so much for the purpose of making its meaning clear as for the greater purpose of giving it a loftier place in your thoughts. Common sense is a degree, a high degree—in fine, the highest degree of human wisdom applied to practical things. It is not learning; it is not knowledge; it is rather the faculty of applying what we may know to what we do. Other things being equal, the practical farmer who knows the most will do the best; but other things not being equal, a man who excells in wisdom and administration may surpass a man of greater learning, or even greater knowledge of things. But do not allow this suggestion to lead you to place a low estimate upon learning, whether general or professional; culture of every sort gives us capacity to appreciate wisdom, and opportunity also for its exercise.—*Practical Farmer.*

Pure Expression.—Every word that falls from the lips of mothers and sisters should be pure and concise and simple; not pearls such as fall from the lips of a princess, but sweet, good words, that little children can gather without fear of soil, or may regret to pain through all their life. Children should be taught the use of good, strong, expressive words—words that mean exactly what they should express in their proper places. If a child or young person has a loose, flung-together way of stringing words when endeavoring to say something, he should be made to "try again" and see if he cannot do better. It is painful to hear many girls talk. They begin with "My gracious!" and interlard it with "So sweet" and "So queenly" and so many phrases that one is tempted to believe they have no training at all, or else their mothers are very, very foolish women. There is nothing more disgusting than the twaddle of ill-bred girls; one is provoked often into taking a paper and reading, and letting them ripple and gurgle on, like brooks that flow they know not whither. Mr heart warms with love for sensible girls and pure boys; and, after all, if our girls and boys are not this, I fear it is our own fault—for this great trust rests in the hearts and hands of the women of our land. If we have a noble, useful purpose in life, we shall infuse the right spirit into those around us.

Words—Thoughts—Actions.—They are all important, and every one of them tell upon our present and future state. The effect of an action—or thought—a word, may not be immediately evident; it may never be discovered by us or other mortals, but it is there, it is in our lives, and it will continue to work upon our destiny for evil or good when our bodies shall lie mouldering beneath the sod. Like flakes of snow that fall unperceived upon the earth, the seeming unimportant events of life succeed one another; and as the snow gathers together—as the avalanche, so are our habits established and our character determined. No single flake that is added to the drift produces a sensible change; no single action creates, however it may exhibit, a man's character; but as the tempest hurls the avalanche down the mountain and overwhelms the inhabitants so passion, acting upon the elements of mischief which pernicious habits have brought together by imperceptible accumulation, may overthrow the principles of truth and virtue. How important it is, then, that we maintain the most sleepless guard upon our passions, and scrupulously weigh out every word, thought and action.

Help the Children.—Parents, help the children. Help them in what? To study and learn the school lessons. Do not let them go to the school with no lessons. Talk it over together, and there will be some things you can tell the little ones, and some ways in which you can help them. There will be sure to be some things you can make them understand.

Older brothers and sisters, help the children. You can have no idea, if you have not tried it, how much good you can do in this way. Moreover, you will find your own ideas of a subject much clearer, after you have tried to make it plain to your younger brothers and sisters. Help them about reading their school books. When they say they have read them, talk with them about what they have read. Ask them questions about it. See if they understand it. Make them feel that to read and understand the book is the thing to be sought not the carrying to and fro of a book more suitable for their fathers and mothers than for themselves.—*Times.*

How to Keep a Situation.—Boys, be ready to throw in an odd half hour or an hour's time when it will be an accommodation, and do not seem to make a merit of it. Do it heartily. Though not a word be said, your employer will make a note of it. Make yourself indispensable to him, and he will lose many of the opposite kind before he will part with you. Those young men who watch the clock to see the very second their working hour is up—who leave, no matter what state the work may be in, at precisely the instant—who calculate the extra amount they can slight their work, and yet not get reproved—who are lavish of their employer's goods—will always be the first to receive notice, when times are dull, that their services are no longer required.

Color and Germination.

Actinism is the chemical power which is necessary to excite germination in plants. It emanates from the blue ray of the spectrum, and is the same power which operates on the sensitive silver in photography. Seeds will not germinate so long as they are exposed to bright light. How the actinic ray reaches the seed in the ground is hard to understand; but that it does penetrate where the luminous ray is unable to reach is plain from experiments, which go also to show that the exclusion of the luminous ray is necessary for the operation of the actinic. Shade is always—absolute darkness sometimes necessary for the success of the germinating process. Plant cress seed an inch deep in three boxes; over the first place a blue, over the second a yellow, and over the third a red glass.

The seeds under the blue glass will be up days before those under the red; and of those under the red a few only will germinate. Those under the yellow will not germinate at all. It is found that those seeds which come up under a white glass in from eight to fourteen days, will, under a blue glass, be up in from two to five days; that where thirty per cent. of seeds came up before, sixty per cent. can now be raised; and that some seeds from tropical countries, which could not formerly be raised in this climate under a white frame, will germinate freely under a blue one.

It would seem that the depth to which the air can penetrate the soil is the measure of the depth of germination. This is the practical result.—*Popular Science.*

Splitting buds, to make them produce trees bearing apples half sweet and half sour, is denounced by a New England nurseryman in the Boston *Cultivator*. He says if you unroll a bud you will find a minute green point at the centre, to cut through which would simply kill it. like a knife in the heart of an animal. If the half of a bud alone could be taken and grown, and the crop would be half apples all over the tree, he would give more credit to the old tradition.

Boys and Girls.

Mollie's Troubles.

I AM little Mollie,
Eight years old to-day,
Never have done nothin'
Only just to play;
Gran'ma says that idleness
Worstest kind o' sin;
Got to learn to work, I s'pose,
Might as well begin.

So I hemmed a towel—
Real well, mamma said—
Had a dre'ful time, though,
Losin' out my thread;
For somehn' ailed the needle,
Don't know 'zacly what,
Till mamma took and tied it
In a little knot.

Don't like hemmin' towels,
'Taint a bit of fun;
I was dre'ful thankful
When the thing was done.
'Cause then I sewed for dolly—
Made a little dress,
And made it just as nice, too,
As you could, I guess.

Made it wiz two ruffles,
Overskirt and basque!
Now, what more, I wonder,
Could a dolly ask:
'Twas much more interestin'
Than hemmin' towels, too—
I wonder why the good things
Are so hard to do?

Then I pared some apples,
Helpin' Kate, the cook;
Then I read my lesson
In the old spellin' book.
Now, spellin' books are awful
Everybody knows;
Just made to try our patience—
Good for that I s'pose.

When night comes, I often
Hear my mamma say:
"Didn't 'spect, this mornin',
Such a busy day.
Seems to me I never had
Quite so much to do."
Tell you I can sympathize—
Feel just that way, too.

How a Lad Wheeled Himself Into Fortune and Influence.

At a meeting of the stockholders of a prominent railway corporation, recently held in Boston, there were present two gentlemen, both up in years, one, however, considerably the senior of the other. In talking of the old times gone by, the younger gentleman called the attention of his friends, and told a pleasant little story, which should be read with profit by every poor, industrious and striving lad. We use his own language:

"Nearly half a century ago, gentlemen, I was put upon the world to make my own living. I was stout, willing and able, considering my tender years, and secured a place in a hardware store, to do all sorts of chores required. I was paid seventy-five dollars per year for my services. One day, after I had been at work three months or more, my friend there, Mr. B., who holds his age remarkably well, came into the store and bought a large bill of shovels and tongs, sad-irons and pans, buckets, scrapers and scuttles, for he was to be married next day, and was supplying his household in advance, as was the groom's custom in those days. The articles were packed on a barrow, and made a load sufficiently heavy for a young mule. But, more willing than able, I started off, proud that I could move such a mass on the wheelbarrow. I got on remarkably well till I struck the mud road, now Seventh Avenue, leading to my friend B.'s house. There I toiled and tugged, and tugged and toiled, and could not budge the load up the hill, the wheel going its full half diameter in the mud every time I would try to propel it forward. Finally a good-natured Irishman passing by with a dray took my barrow, self and all on his vehicle, and in consideration of my promise to pay him a 'bit,' landed me at my destination.

"I counted the articles carefully as I delivered them, and with my empty barrow trudged my way back, whistling with glee over my triumph over difficulty. Some weeks after I paid the Irishman the 'bit,' and never got it back from my employers. (Mr. B., I am sure, would have remunerated me, but he never before heard this story; so if he is inclined, he can compromise the debt by sending me a bushel of his rare ripe peaches next Fall.) But to the moral. A merchant had witnessed my struggles, and how zealously I labored to deliver that load of hardware; he even watched me to the house, and saw me count each piece as I landed it in the doorway. He sent for me the next day, asked my name, told me he had a reward for my industry and cheerfulness under difficulty, in the shape of a five hundred dollar clerkship in his establishment. I accepted, and now, after nearly half a century has passed, I look back and say I wheeled myself into all I own, for that reward of perseverance was my grand stepping-stone to fortune."

The speaker was a very wealthy banker, a man of influence and position, and one universally respected for many good qualities of head and heart. Boys, take a moral from this story, and be willing and industrious. You do not know how many eyes are upon you to discover whether you are sluggish and careless, or industrious and willing, or how many there are who, if you are moral and worthy, will give you a stepping-stone to wealth and position.—*Arthur's Magazine.*

SILK-LINED HOUSE.—I heard too little boys down by the brook to-day, talking about their fathers' houses, and boasting how grand they were. Johnny said his house had a velvet carpet in the parlor, and lace curtains at the windows. Willie said his house had splendid glass chandeliers, that sparkled like diamonds; and the walls were beautifully painted. I thought I would like to tell them about a house very much more wonderful than those they lived in, because it is built by a small insect.

This house is made by a kind of spider that lives in California, and is called the mason-spider. His house is very marvelous for such a little fellow to make all by himself, without any hammer, or saw, or trowel, or axe, or nails, or plaster, or any such things as men use in building; and yet his mansion is fit for a little queen; for it is lined throughout with white silk!

This spider's house is nearly as large as a hen's egg, and is built of a sort of red clay, almost as handsome as the brown stone they are so proud of in New York city. It is cylindrical in shape. The top opens with a little trap-door, which is fastened with a hinge, and shuts of itself. The door and inside are lined with the most delicate white silk, finer than the costliest dress ever worn by a lady.

Mr. Spider builds his house in some crevice or bores a cylindrical hole in the clay, so that all is concealed from view except this tiny trap-door. When he sees an enemy approaching, he runs quickly to his silk-lined house, swings open the little door, goes in, and, as the door shuts tightly after him, holds it firmly by grasping his claws in two openings in the white-silk lining of the door, just large enough to admit his little hands or feet, which ever you choose to call them; and here nestled in this luxurious retreat, he bids defiance to all intruders.

I heard all about this spider from a gentleman who had been to California, and who had brought home one of these red-clay, silk-lined houses. He was showing it to some children as they were walking near me. I wish you all could have seen it.—*St. Nicholas.*

THE Agricultural Society of France has offered prizes of 1000 francs ($200) each for the best method of artificial irrigation, or the best means of destroying the *Phylloxera vastatrix*, for the best economical means of utilizing the beet root and its products, and for the educational establishment which shall have taken the best means to instruct in agriculture and horticulture.

Mole and Toads.

The mole is a much abused animal. He is generally believed to be a vegetarian, but, on the contrary, he is carnivorous, living upon the larva or grubs of winged insects or upon insects whose proper habitat is in the earth. We have never detected a mole eating a plant, but in every case where the plant has been under-run by the mole and consequently wilted, we have found that its roots had been previously eaten off by the larva of the cockchafer (June bug) or by some other insect. Friend in the country, whom we visited during the Summer, complained of the havoc made by moles in a large bed of lilies. On examination we found scores of the shoots of the lilies, wilting and dying on the rows, which had been under-run by the moles. These shoots were found gnawed off, and in a manner to indicate, beyond doubt, that they were destroyed by the grub or the larva of the cockchafer, and not by the moles. The bulbs, planted six or more inches deep, were untouched, and the burrows of the moles were not more than three or four inches below the surface of the soil. Searching in other parts of the bed we found grubs busily at work—the bed, part of a freshly turned-under, piece of grass land, being full of them, as such land is always sure to be.

The mole, by burrowing about in our gardens in search of his food, often does much mischief by running under small, freshly set out plants; but we have the choice of two evils—the bearing with the small amount of injury he does, or bearing the far greater annoyance and injury produced by grubs and worms. His presence is a sure sign that our gardens are, or have been, infested with these. The accusation that he is a vegetable eater is a curious instance of jumping to conclusions and of the making of reliable evidence out of mere coincidences. Because plants are found gnawed through and die when over his burrow, it is concluded that he is the cause, whereas he was only destroying the destroyer—rendering a service instead of doing an injury.

The toad—almost universally despised and upbraided for his ugliness—is, yet, a useful, good-natured, quiet fellow, who recognizes his friends and those who are kind to him. We have some half dozen of them in our small garden, and among them one old patriarch who, when we are digging or hoeing, will sit winking and blinking at us with his pretty eyes, and often compel us to lift or drive him aside to get him out of harm's way. He will stay by us for hours, evidently feeling that he need fear no hurt. Like the sparrow, the toad has been considered a nuisance, and in some sections exterminated; but the exterminators have been only too glad, afterwards, to get him back by the expenditure of large sums of money. So useful are toads in gardens that they are sold in France by the dozen, for the purpose of stocking gardens to free them from many injurious insects. The toad lives almost entirely on winged insect, and never does harm to the plant.

We trust that our readers will accept this plea for these useful laborers in our gardens, and not destroy them on false accusation. By observing their habits closely and discerningly it will be found that they are friends, and neither enemies nor intruders. The ant eats the eggs of insects; the mole larva, and the toad the winged insect itself.—*American Garden.*

DRILLING WHEAT.—The *American Agriculturist* says every year's experience is in favor of drilling wheat. It shows more and more that, as against sowing the seed broadcast, it is economical in labor and seed, and gives a better crop. The difference in labor is at least $1 an acre, or the cost of two harrowings after sowing, on one cultivating. The difference in seed is at least half a bushel, or fifty cents to $1 an acre, and the difference in the crop is fully one-fourth, or upon fairly good soil, six bushels, or $9 per acre.

CARBOLIC ACID.

(*Continued from page 99.*)

CATTLE DISEASE

in Europe, the rinderpest. It was used about the stalls in the proportion of 2 pounds or pints to the barrel or 40 gallons of water. In the pleuro-pneumonia of cattle it has been found equally serviceable used in the same way. In these and other blood diseases in cattle, I would advise the internal administration of carbolic acid as a drink in the proportion of half an ounce of the acid to the gallon of water. In murrain, rinderpest, the Texas cattle disease and others of a like fatal character no other remedy has been found of any specific value whatever. If, as thought by many, these diseases depend upon the introduction into the circulation of

POISONOUS SPORES, OR ANIMALCULES,

we must follow them into the circulation, run them down, capture and destroy them in the body by an agent which we know will destroy them out of the body.

A singular disease occurred in our neiboring county of Santa Cruz two or three years ago. "The first symptoms appear to be an itching, or the desire to rub some portion of the body, the friction momentarily allaying the torment, which soon returns with increased violence until skin and hair are rubbed off; the animal becomes frantic, and dies in a period varying from eight to twenty-four hours after the first symptoms have shown themselves. Sometimes they bleed to death. Mr. R. McClure, veterinary surgeon of Philadelphia, attributes the disease to entozoic parasites taken into the stomach from the grass, in the form of *ova* of these parasites." These were cases in which carbolic acid, administered internally, would in all probability have destroyed the paratites and saved the animals.

The known efficacy of carbolic acid as a wash in the

SCAB AND ROT IN SHEEP

needs no comment. It may be equally serviceable in grub in the head if used at an early stage of the disease.

On account of its deadly influence upon the lowest forms of animal and vegetable life, it has been used with great success among our

DOMESTIC FOWLS.

These are well known at times to be afflicted with vermin that literally eat them up. Hens will sometimes be found setting upon a nest full of eggs dead and covered with millions of lice. If these latter be examined they will be found filled with blood. But take your hens and apply a solution of this acid in about the strength of an ounce to a gallon of water to the bodies of the birds, under their wings, and sprinkle the same over the walls, roosts, and nests of the hen houses, and these vampires will soon disappear. In cases of swelled head, staggers and other epidemic and contagious diseases a few drops of the acid might be added to their water troughs, and the disinfectant solution mentioned above might be sprinkled about the houses and suspended in saturated rags among their roosts. In the

KIDNEY DISEASE AND MEASLES OF HOGS,

and in the distemper in dogs and colts, carbolic acid used as directed has been found of great service.

In our limited space we have been able to take but a passing glance at this important subject. Volumes might be written without exhausting it. With hundreds and thousands of intelligent observers, however, throughout the country its successful employment in many of the

DISEASES OF BOTH MAN AND BEAST

will be only a question of time. When we reflect that it is derived from coal, we cannot wonder that it should resemble its progenitor in its multifarious uses; for coal warms the civilized world, cooks for half of mankind, besides turning half their machinery; propels thousands of ocean palaces round the world; and presents us with pigments that vie with the rainbow in its brilliant hues. And why should it not? It is but the concentrated essence of the forests of the ancient world. Luxuriating in an atmospheric ocean of carbonic acid gas, what wonder that those ancient trees should gather and store up the wealth of hydro-carbons that now light the humble tenements of the poor, illuminate the palaces of the rich, and flash their diamond lights along the thoroughfares of the great cities of the world. What wonder that it should contain valuable dyes, brilliant colors, exquisite perfumes and valuable remedies when those old trees bloomed and basked in the light and warmth of a genial sun? It is but ancient chemistry repeating itself. It is but the resurrection and reproduction of the solar rays of the old world after they had laid for countless ages embalmed in the rocky mausoleums of earth.

San Jose, April, 1875.

NEW PUBLICATIONS.

Resources of Santa Clara Valley, California. Published by the San Jose Board of Trade. Illustrated with engravings of several public buildings and private residences. 32 pages. *Mercury* print. Price, 15 cents.

This book is designed to show the advantages of our valley as a place of residence; and the climate, soil, productions, educational and other important matters are placed before enquirers in a concise and readable shape. A map of the county is bound in with the book. Send stamp and 15 cents to San Jose Board of Trade for a copy.

Life and Career of Tiburcio Vasquez, the Bandit and Murderer. By Eugene T. Sawyer. Price, 50 cents. B. H. Cottle, publisher, San Jose.

This is the title of a 48-page pamphlet, in cover, illustrated with life-like portraits of Vasquez and Sheriff Adams. It is as complete and accurate an account as could be written within the same space. Probable there is not a person living so well able to write this work as Mr. Sawyer. As a reporter, he has kept close track of the bandit, and has interviewed parties concerned and Vasquez himself, and written more and oftener for the press concerning his career, capture and execution than any other man. Mr. E. K. Dunlap, at the post-office newstand, San Jose, has procured the sole agency for the book. It will be found intensely interesting.

AVERILL CHEMICAL PAINT.

The Averill Chemical Paint has evidently now a run of business that it deserves. Since Tyler Beach, our old townsman, took the management of the manufactory it has done a splendid business. Parties living in the country about San Jose, who think of painting, are referred to the following named parties and buildings in San Jose that have used it: Mr. Tisdale, of the Farmer's Gold Bank, on the Alameda; D. C. Bailey's house on Third street; Mrs. Ashley's fine house, fronting St. Jame's Park; the two new houses built by Mrs. Hawes on Second street. James Lick is using a laage amount (600 gallons) on his buildings on Lick's homestead. Mr. J. S. Carter, grain dealer, has painted his barn with No. 4 tint. Theodore Lienzen, Architect, is using it on his buildings. Hay's new building, on Second street, adjoining Central Market, and many others. By examining for yourselves before purchasing paint, you will be convinced that for superior body and gloss there is no paint equal to it. It is at once the cheapest, most durable, and best paint made, and is ready prepared for use without any mixing.

NEW STORE AND FIRM.

Messrs. Smith & Ryder, jewelers, have fitted up the rooms in Wilcox Block formerly occupied by the Farmers' National Gold Bank and opened a fine assortment of American watches, clocks, and gold jewelry. They will make a specialty of heavy, strong watches for farmers' use. They are also sole agents for the Chickering piano and Estey cottage organ. Read their advertisement and give them a call.

Nothing has yet been developed in regard to the Calaveras valley water project. The company of which Felton and McLaughlin are the leading spirits, is holding back, awaiting developments in San Francisco. They think that that city, before long, must look to them for its water supply. Then they will conclude the purchase of the land in the Calaveras valley and proceed to the erection of the great dam, which will have a height of 230 feet. The water will cover an area of about 1400 acres, and will have an average depth of 100 feet. The volume of water will be immense, and will be gathered from the creeks known as Smith's, the Arroyo Hondo, and the Calaveras. The reservoir will have a water shed of about 254 square miles. The cost of purchasing all the land required by the company will be about $200,000. Of this amount $45,000 have already been paid. The balance will be paid on the first of December next.—*Mercury.*

The habit of being always industriously employed is a great safeguard through life, as well as essential to the cultivation of every virtue.

ORCHARD FOR SALE

CONTAINING TEN ACRES OF THE Very Best Land, fully improved. On the place are 3 acres of Blackberries, 1 acre of Strawberries, 500 Bartlett Pear trees three years old, just coming into bearing; 100 Winter Nelis trees, three years old; 1 acre of Foreign Grapes; an Old Orchard in full bearing of Quince, Bartlett, Winter Nelis and Easter Beurre Pears, 500 French Prune trees. Also, a House, Barn, Carriage House, 3 superior Wells, 2 Windmills, and a Horse-power for raising water. For terms, etc., apply, either by letter or personally, to

Z. TAYLOR.

Mr. STUYVESANT,

Of Edgewood, Poughkeepsie, New York, wishing to increase his Short-horn herd of cattle, offers for sale is entire herd of

AYRSHIRE CATTLE,

Containing Twenty-five Cows in milk and in calf to

"ROBBIE BRUCE,"

Undoubtedly the finest Ayrshire bull in the country; four Heifers, due to calf by the same Bull during the Summer; seven Heifer Calves, dropped this Spring; four Bull Calves of this Spring; one yearling Bull, and the Bull ROBBIE BRUCE. This entire herd will be sold for the sum of **$8,000.**

This herd is composed of the two entire herds formerly belonging to Mr. W. Rivulet of Springfield Mass., and Mr. H. S. Collins, Collinsville, Conn. Mr. Stuyvesant having some years since bought these two entire herds, and having had a week ling out sale last fall.

The above stock is now recorded in Mr. Bagg's Canadian and American Ayrshire Herd Book. Mr. Stuyvesant, however, will agree to record all this stock either in the new volume to be issued by the Ayrshire Breeders' Association, or in Messrs. Sturtevant's new work called "North American Ayrshire Register," or in both, to suit the buyer.

Mr. Stuyvesant was awarded the HERD PRIZE at the New York State Fair at Rochester, last Fall, with large competition.

THE PEDIGREES

of this stock are all good. Catalogues containing a description of the herd will be sent on application. Also, catalogue of the small but value herd of Short-horns at Edgewood written out on application.

AND

LIVE STOCK JOURNAL.

Vol. 6. San Jose, Cal., June, 1875. No. 6.

A NEW GRAPE-VINE PEST.

Our attention was called by Mr. F. Garrigus, of Santa Clara, to the ravages of some sort of a small bug, flea or fly that had attacked Mr. Norman Porter's vineyard which is situated upon chimasel land near the foot of the mountains at the west of our valley. Also, Mr. D. C. Feeley brought to our office some of the same sort of insects, that he said were attacking a small vineyard not his own in the foot-hills of the same range. After a look at the insects through a microscope, we rode over to the Porter place, and in company with Mr. Stone, who has charge of the farm and who kindly assisted us in bottling a few more of the bugs, we made a close observation of the habits of the insect throughout the vineyard. Then at home we again examined with the microscope. To the naked eye the full-grown insect is about one-tenth of an inch long, is dark-colored, has wings much like those of a common fly, prominent eyes, oval body, and when it is approached exhibits fear, and if disturbed, with a quick motion, almost a hop, it either flies or drops to the ground, where it seeks shelter under clods of earth, dead weeds or other rubbish of any kind. The young bugs, when first hatched, look like tiny, light-colored spiders. As they get larger they more nearly resemble the green aphis in shape, not in color, and do not get wings apparently till the last shedding of the skin. They work in groups and where they attack a vine they first tap the largest leaves and the bark near the base of the new growth of wood, and invariably take the tenderest new growth last, seeming to prefer a growth nearly matured to the tender new shoots. They will cluster thickly upon whatever they attack. As they rest upon the vines their heads are always towards the ends of the vines, and with such regularity do they cluster upon the wood that one might easily miss seeing them did not the vine wither and the leaves dry up wherever the insects infest them. Throughout the vineyard of sixty acres the bugs seemed to be working in some spots very badly, in others but little. Some of the vines were apparently entirely destroyed, and it was often that they made a clean sweep of whatever vine they attacked. In an adjoining young almond orchard of thirty acres we found some, but they did not seem to like the almond much. Several young English walnut trees had been attacked, some lower limbs killed but not the whole tree. Several species of weeds were covered, but a sort of annual milkweed that is very abundant upon the place seemed to be the favorite food. Mr. Stone thought that this weed is what brought them there, and said that it grew thickly in the vineyard and was not plowed up last Spring until it was almost knee-high. The bugs swarm in almost countless millions in the half-buried stuff that was turned under, from the smallest to the largest sized bugs. Mr. Stone had sprinkled sulphur and tried to kill the bugs, but had finally given it up, as the very ground seemed so full of them. He had been advised to use carbolic acid, but as nothing less than a thunder shower of it would reach them all, he despaired of that remedy. We noticed particularly that the bugs do not burrow in clean earth, but resort to the foul stuff half-buried in the soil. We advised raking the ground clean and piling the dead weeds and rubbish between the rows of vines, thus laying traps for them. It seems that at night and when the wind blows hard the bugs leave the vines and seek a shelter. Where there was not stuff enough upon the ground to burn readily, we advised the adding of straw, and then when the bugs were all collected in the shelters thus provided, to apply the torch. We are of the opinion that this pest, alarming as it seems to be and is, can easily and cheaply be destroyed in this way, so that but little damage to vineyards will necessarily result. We do not blame the vineyard men for being alarmed, only we wish they were less inclined to keep the matter a secret, fearing it would injure their prospects in case they should desire to dispose of their property. We understand that Norman Porter's fine vineyard and orchard have been before the market for some time, and we were cautioned to say nothing to injure him. We certainly have no desire to. His 90 acres of almonds and choice varieties of grapes must be a fortune to any one in spite of bugs, if properly managed. Besides, such bugs only make their appearance once or twice in a generation, and at most only last two or three years at a time; and if they can easily be destroyed, as we have no doubt they can be, the damage will be trifling indeed.

Microscopically we have made but a partial examination. The insect belongs to the order HEMIPTERA. Although in some respects it is closely allied to the *Aphididæ*, it is really a *Cicadadæ*. In other words, it is more of a harvest fly than a plant louse. It is something like the vine-fretter of Europe and the leaf-hopper of the East, that so nearly destroyed the vineyards that some persons abandoned their grapevines many years ago. But as we fail to find an accurate description of this bug, we think it a distinct variety, peculiar to our climate. When we take into consideration, for instance, the fact that over 4,000 species of wevils have actually been scientifically named and described, what need we wonder that we have here a harvest bug somewhat different from what has been observed in any other country? And why should not we take a little pride in thinking we have a bug of our own, as well as a locust of our own in California? This bug does not eat, has no jaws, but lives upon the juices of the plants, which it draws through a horny, black beak, attached to the under side of its face, and which lies bent under the breast, reaching to the abdomen, when not in use. Attached to this beak, near its hilt, is a sharp, needle-like lance, with which to puncture the bark before applying its beak. Its head and thorax is half the length of its body, which is an elongated oval. The antennæ, or feelers, are three-jointed, and about the length of its beak, which is also three-jointed. The hind legs are not larger than the others, but the thighs are dark-colored. All the feet are three-jointed, and the last joint is dark-colored. The foot has two claws, one of which is much stronger than the other. The wings slope to the sides slightly; wing-covers transparent. When crushed between the fingers it emits a chinch or bed-bug odor. The full-sized insect has few marks or stripes, and is a chocolate color, darkest on its shoulders. The young are more or less colored from a light straw to a deep orange in blotches with chocolate. We think the young are hatched before leaving the abdomen of the female, but of this we are not certain. There is little transformation during the different stages of growth until the full-grown winged insect appears..

A perfect description of this insect, which we are not now prepared to give, would be mainly interesting to scientific readers. But everyone who either owns a grape vine or eats a grape must feel an interest in the advent of this bug. How to prevent and how to destroy this grape-pest is a matter of much concern. To learn its correct name, to ascertain its nature and habits, so as to best understand how to accomplish its destruction is the work of the scientist, and everyone is a scientist to the extent that he understands the facts, principles and nature of things, and how to apply means to accomplish a given end.

Addenda.—Since writing the above we have seen Mr. Stone again. He found that the traps of weeds and straw would not work, as the bugs would be close to the ground under the piles, and as soon as the flame was put to them they would scatter, and by the time the heat reached the ground the bugs would be gone. But Mr. Stone has tried kerosene with success. One-third kerosene and two-thirds water sprinkled upon the vines would kill all the bugs it touched and prevent the bugs from again attacking the vines once wet with the kerosene. Mr. Stone is sure that he now has the power to save the vines from the bugs. Our theory, though plausible, would not stand the practice, which after all is the only reliable test. The only question now is, how much kerosene will the grapevines stand without being killed or injured.

EDITORIAL NOTES.

Pestifferous.—The dry season appears to be favorable to the life of insect pests. The grasshoppers in some places are bad; worse in Colorado and adjoining Territories than in California. They are literally devastating a large extent of inhabited country, destroying millions of property in growing crops. In our Santa Clara valley the caterpillars are destroying the fruit crop in some orchards; others they have not troubled. We saw hundreds of apple trees in Mr. Gould's and Mr. Watkins' orchards with the foliage stripped from them. They are not the tent caterpillar, but when not eating the leaves cluster together on the large limbs and trunks of the trees. When in this position it would not be a difficult matter to destroy great numbers of them, but we saw no disposition to attempt their destruction, and were told that there is so little profit in fruit culture that it would not pay to spend the time necessary to kill them. Also the live-oak trees are infested with caterpillars—a different variety from those on the fruit trees. These consume the hard foliage as a fire, leaving the trees as desolate as a deciduous tree in Winter. The caterpillars on the oak have large heads, nearly smooth bodies, and do not live in tents or cluster together much. They are about an inch and a half long. The one on apple trees is at least two inches long, and is quite hairy, with apparently pointed ends. There is another much smaller caterpillar troubling the pear trees in some localities. Squash bugs are plenty, and the grape vine fly is getting worse every day, so we are told. Observing persons say that many insects presage a dry season to come, or a series of dry seasons.

In order to support the "great and growing agricultural and industrial interests of the Pacific coast," another liquor paper has been started in San Francisco. It comes out like a bloody pirate that it is, under a flag not its own. It calls itself "temperance" because it wants to appear respectable, while its own black flag is hidden. But it will deceive no one by this pretense—it only shows its own cupidity. It is published by Carmany & Co.

The fruit crop will be much lighter this season than our orchardists at first thought. The young fruit has commenced falling before being half grown—some varieties are nearly a failure. It is thought that the heavy April frosts so weakened the embryo fruit that it could never perfectly develop. On the whole it is estimated there will not be over one-half a crop this season. There will probably be enough to supply the demand for green fruit at paying prices, but the drying and canning factories will be likely to run short of material. The grape crop, so far as we can learn, promises to be abundant.

Chaos Eclipsed.—We have been lately forced into having some experience in law and the courts, with a lawyer (so called) against us. We have come to the conclusion that any person who expects to find justice in that way is very verdant. That law is made quite as much to elude as to secure justice, and those who administer and judge the law are far from perfect in conscience and in judgment. The dishonest man, the trickster, and the perjurer, has all the advantage; and that phase of our civilization found in a "court of justice" offers a premium on rascality as against honesty, and is a virtual failure so far as right is concerned; and if the such laws were repudiated, law books burned, and lawyers, justices and judges were contraband, and the whole thing resolved down to first pinciples, "an eye for an eye," etc., and double-barreled shot-guns, it would suit us better, for a decent man then would stand at least an equal show of getting his own, and securing justice when due.

New Game Law Needed.—There is need of a revised game law in California to favor farmers, founded upon the principles given below, which we clip from the *Rural New Yorker*; only we would qualify by allowing a farmer to destroy, during any season, such game as may be destructive to his crops. We have known quail to destroy grain and small fruits when a few doses of shot, which the law forbade, would have saved the crops and much trouble and annoyance.

The question of the right of property in game that find shelter or may breed on the premises of a farmer, or may be found on his farm, and his right to make use of it at will, is an issue that is being and to be made in the Legislature of some of the States. The sportsmen insist that the game is the property of the State, and the time and manner of killing it should be regulated by the States. Farmers —some of them at least—claim that they have the right to any game that may be found on their premises to use as they may choose and when they choose. The claim is to be urged before legislative bodies that it may be recognized. It seems to us equitable that the farmer should have the right to kill any kind of game found on his premises at any time, for his own and family's consumption as food; other than that we would restrict his privilege to destroy it in any manner at certain seasons of the year—at those seasons usually named in the game laws. Added, we would make it a criminal act for a sportsman to invade and shoot or fish upon any person's premises without the latter's consent. This is the only mode by which a man can be protected from the lawless depredations of a large class of professional sportsmen, who are as impudent and insulting as they generally are irresponsible.

Irrigation vs. Cultivation. — We frequently see something like the following extract going the rounds of the press, without qualification, calculated to deceive those who have not by practical experience in this dry climate learned better. We know that unless the land spoken of is supplied with water from some other source than what rain falls upon it, it would be impossible to grow such crops. Probably the farm spoken of is on low, alluvial soil, the subsoil of which is kept filled with moisture by the seepage of water from some stream situated above or near it (there is much such land in this State); or, it may be in a natural basin which nearly fills during overflow and holds the water in sufficient quantities to supply vegetation by capillary attraction from below during the dry Summers, (we have seen such land in New Mexico). We know that no system of farming will bring such crops every year on soil that depends solely on the rain which falls upon it during the rainy reason. Here is the article referred to:

The Los Angeles *Press* has found a man by the name of Burke who will nor irrigate his farm, though he has a chance to do so. It says: "He is one of the most prosperous farmers in the county, and for five or six years he has declined to irrigate his lands at all. He has ample facilities for that purpose, but by deep plowing, and the ordinary attention which an Eastern man bestows upon his crops, he does not need to use them. His whole hundred and fifty acres will average him every year from seventy to seventy-five bushels to the acre. He has, besides, one of the best orchards in the county, of apples, pears, peaches, etc., and none of these trees ever see a drop of water except the natural rainfall. To-day, within reach of irrigation, Mr. Burke has absolutely a prejudice against it."

San Jose Daily Advertiser.—This the name of a new paper lately started in our city. It is a small sheet, neatly printed, and deserving of success. We are disgusted with our "old dailies," and hail the *Advertiser* as a harbinger of better things to come.

Concrete Buildings.

EDITORS AGRICULTURIST:—Can you give any information in regard to concrete buildings—material to use, mode of building, etc.? About eighteen years ago I saw an account in the *Rural New Yorker* of a man's making walls in his fields of concrete. Why would it not do here where there is no freezing to injure it? Some of your readers may have had experience with it for fencing and can answer as to its utility. W. A. T.

[Will some of our readers who have the requisite knowledge or experience please answer this query?—EDS.]

Poetry.

The Untilled Land.

ALTERED FROM DUGANNE.

THE water hath fish and the land hath flesh,
And the air hath many a bird;
And the soil is teeming o'er the earth,
And fruits grow fair in many lands,
Yet millions of hands want acres,
And millions of acres want hands.

Sunlight and breeze and gladsome flowers
Are o'er the earth spread wide,
And Nature gave these gifts to men.
To all who on earth abide.
The soil lies fallow, the woods grow rank,
The tide the poor man steals,
Ah, millions of hands want acres,
And millions of acres want hands.

'Tis writ that we "should not muzzle the ox
That treadeth out the corn,"
Yet behold, ye shackle the poor man's limbs,
That all earth's burdens have borne!
The land is the gift of Nature to man,
And labor is Nature's command,
Yet millions of hands want acres,
And millions of acres want hands.

Who hath ordained that the few should hoard
Their millions of useless gold,
And rob the earth of its fruits and flowers,
While pestilless soil they hold?
Who hath ordained that a parchment scroll
Shall fence round miles of lands,
When millions of hands want acres,
And millions of acres want hands?

'Tis a glaring lie on the face of day,
This robbery of men's rights!
'Tis a lie that the face of Nature disowns!
'Tis a curse that burns and blights!
And I will burn and blight till the people rise
And swear, while they burst their bands,
That hands henceforth shall have the acres,
And the acres henceforth have hands.

To a Young Man Leaving Home.

You're starting to-day on life's journey,
Alone on the highway of life;
You'll meet with a thousand temptations—
Each city with evil is rife.
This world is a stage of excitement,
There's danger wherever you go;
But if you are tempted in weakness,
Have courage, my boy, to say "No!"

The siren's sweet song may allure you;
Beware of her cunning and art!
Whenever you see her approaching,
Be guarded and haste to depart.
The billiard saloons are inviting,
Decked out in their tinsel and show;
You may be invited to enter;
Have courage, my boy, to say "No!"

The bright ruby wine may be offered;
No matter how tempting it be,
From poison that stings like an adder,
My boy, have the courage to flee.
The gambling halls are before you;
Their lights—how they dance to and fro!
If you should be tempted to enter,
Look twice, even thrice, ere you do.

In courage alone lies your safety,
When you the long journey begin,
And trust in good moral precepts
Will keep you unspotted from sin.
Temptations will go on increasing,
As streams from a rivulet flow,
But if you are true to your manhood,
Have the courage, my boy, to say "No!"

The Two Reapers.

Two reapers toiled, their task half done,
Had reached a tree whose shade had run
Full twice its length.
With failing strength
Both cast themselves beneath.
Both gnashed their teeth
And cursed their lot:
"We toil and sweat, we sweat and toil,
And while the owner of this soil
Is blessed with plenty through our sweat,
We scarcely have enough to eat,"
Thus reasoning, one reached forth his hand
To grasp a pot.
Both took a draught. Oh, what disgrace!
The fiery stuff soon flushed their face
And temper too.
Says one: "This world is all a chance.
I'll not believe in Providence.
Through rain or shine, through cold or hot,
We toil and labor all for naught."
A zephyr passed, his voice was heard,
With tenderness her heart was stirred,
And bending low to make him hear,
She whispered softly in his ear:
"God is to you a partial Father,
While you drink rum, this farmer water!"
—[Wm. Horne.

To-Day and To-Morrow.

Awake my soul! with eager zeal
The daily task beginning;
For labor hath its pleasures real,
And dearly worth the winning.
What though with toil and care oppressed,
The day seems long and dreary?
We should not know the joy of rest
If we were never weary.
Then up! and banish sloth away,
Nor care nor trouble borrow;
For patient, earnest toil To-day
Wins triumphs for To-morrow.

What though the heedless crowd around
May greet you with their laughter?
It proves that they have never found
What we are seeking after—
The lofty joy, the pure delight,
That lights the path of duty;
That makes the earth about us bright
And life a thing of beauty.
Then up! and banish sloth away
At work-bench or in furrow;
Let others laugh at us To-day,
We'll laugh at them To-morrow.

This lesson Nature yet instills,
As well as Revelation—
That everything created fills
Some chasm in creation.
There's not a grass-blade in the vale,
Or flower that looks to heaven,
To which, could we but read the tale,
Some use has not been given.
Then up! let us of nobler clay
From these a lesson borrow;
For sloth and idleness To-day
Will bring regret To-morrow.

The meanest worm that crawls the dust,
Before its life is ended,
Accomplishes the purpose just
For which it was intended.
Think ye that man alone hath been
Placed in the world to mar it?
Shall we live, and our fellow-men
Be none the better for it?
No! let us lend a feeble ray
To light the gloom of sorrow;
For we, who prefer sid To-day,
May need the same To-morrow.

We each can make, though small and weak,
The world a little brighter.
With every cheering word we speak
Somebody's heart is lighter.
And should misfortune be our share,
With grief and pain attended,
Each pang will patience let us bear,
We know 'twill soon be ended.
Though rough and thorny be our way,
And paved with pain and sorrow—
Though we may sow in tears To-day,
We'll reap in joy To-morrow.

Don't Run in Debt.

Don't run in debt—never mind, never mind
If your clothes are all faded and torn;
Fix 'em up, make 'em do—it is better by far
Than to have the heart weary and worn
Who will love you the more for the set of your hat,
Or your ruff, or the tie of your shoe;
The style of your boots, or shade of cravat,
If they know you're in debt for the new?

Good friends, let me beg of you, don't run in debt,
If the chairs and the sofa are old;
They'll fit your backs better than any new set,
Unless they are paid for—with gold.
If the house is too small, draw the closer together,
Keep it warm with a hearty good will.
A big one, unpaid-for, in all kinds of weather
Will send to the warm heart a chill.

Don't run in debt—dear girls, take a hint;
If the fashions have changed since last season.
Old Nature is out in the very same tint,
And old Nature, methinks, has some reason.
But just say to your friends, I cannot afford
To spend time to keep up with fashion;
My purse is too light and honor too bright
To be tarnished with such silly passions.

Gents, don't run in debt—let your friends, if they want,
Have fine houses and clothing and flowers;
But unless they are paid for, be more of a man
Than to envy their sunshiny hours.
If you've money to spare I've nothing to say,
Spend your dollars and dimes as you please;
But mind you, the man who his note has to pay,
Is the man who is never at ease.

Kind husbands, don't run in debt any more,
"Twill fill your wife's cup full of sorrow,
To know that a neighbor may call at your door
With a bill you must settle to-morrow.
O, take my advice, it is good, it is true!
But lest you may, some of you, doubt it,
I'll whisper a secret, now seeing 'tis you—
I've tried it and know all about it.

The chain of a debtor is heavy and cold,
Its links all corrosion and rust;
Gild it o'er as you will, it is never of gold,
Then spurn it aside with disgust—
"I've tried it and know all about it."

Pace Implora.

BY JOAQUIN MILLER.

Better it were to sit still by the sea,
Loving somebody and satisfied—
Better it were to grow babes on the knee,
To anchor you down for all your days—
Than wander and wander in all these ways,
Land forgotten and love denied.

Better sit still where born, I say,
Wed one sweet woman and love her well,
Laugh with your neighbors and live in their way,
Be it never so humble. The humbler the home,
The nobler, indeed, to bear your part.
Love and be loved with all your heart,
Drink sweet waters and dream in a spell,
Share your delights and divide your tears.
Love and be loved in the old east way,
Ere men knew madness and came to roam
From the west to the east and the whole world wide—
When they lived where their fathers had lived and died—
Lived so loved for a thousand years.

Better it were for the world, I say—
Better, indeed, for a man's own good—
That he should sit down where he was born,
Be it land of sands or of oil and corn,
Valley of poppies or bleak northland,
White sea-border or great black wood,
Or black white winter or bland sweet May,
Or city of smoke or plain of the sun—
Than wander the world as I have done,
Breaking the heart into bits of clay,
And leaving it scattered on every hand.
VENICE, 1874.

—[Overland Monthly,

Labor.

Toil swings the axe and forests bow,
The seeds break out in radiant bloom,
Rich harvests smile behind the plow,
And cities cluster round the loom.
Where towering domes end tapering spires
Adorn the vale and crown the hill,
Stout Labor lights its beacon fires
And plumes with smoke the forge and mill.

The monarch oak, the woodland's pride,
Whose trunk is seamed with lightning scars,
Toil launches on the restless tide
And there unrolls the flag of stars.
The engine, with his lungs of flame,
And ribs of brass, and joints of steel,
From Labor's plastic fingers came,
With sobbing valve and whirling wheel.

'Tis Labor works the magic press,
And turns the crank in hives of toil,
And beckons angels down to bless
Industrious hands on sea and soil.
Here sun-browned toil, with shining spade,
Links lake to lake with silver ties.
Strung thick with palaces of trade
And temples towering to the skies,

The Plough.

Far back in ages
The plough with wreaths was crownod;
The hands of kings and sages
Entwined the chaplets round.
Till men of spoil disdained the toil
By which the world was nourished,
And blood and pillage were the soil
In which their laurels flourished
Now the world her fault despairs,
The guilt that stains her story,
And weeps her crimes amid the cares
That form her earliest glory.

The throne shall crumble,
The diadem shall wane,
The tribes of earth shall humble
The pride of those who reign;
And war shall lay his pomp away;
The fame that heroes cherish,
The glory earned in deadly fray,
Shall fade, decay and perish.
Honor waits o'er all the earth,
Through endless generations,
The art that calls the harvest forth
And feeds the expectant nations.
—[Wm. C. Bryant.

Mist.

How do the rivulets find their way?
How do the flowers know the day,
And open their cups to catch the ray?

I see the germ to the sunlight reach,
And the nestlings know the old birds' speech;
I do not see who is there to teach.

I see the hare from the dasger hide,
And the stars through the pathless spaces ride;
I do not see that they have a guide.

He is eyes for all who is eyes for the mole;
All motion goes to the rightful goal.
O, God! I can trust for the human soul.
—[Chas. G. Ames

Between two evils choose neither.

ABOUT THE SEASON.

The failure of our usual Spring rains has brought a veritable drouth upon the country, notwithstanding the early promise of an abundant harvest. Early sown grain that had the advantage of a good root growth while the Winter rains prevailed, are the only fields that have succeeded on dry lands and under ordinary treatment. Only a few fields of late sowed grain have done well, and only such fields as received extra tillage, or were put in on land that had been previously in pasture or summer-fallow, did well sown late.

Old Californians think another series of dry seasons has commenced. Every sign points that way, and it is about the time in a decade of years for such an occurrence. It is well, at any rate, for every farmer to make calculations for such an event.

To such as are fortunate to have farms upon low lands but little need be said. They will profit by the failure of those whose farms are high and dry, by getting better prices, etc. But, to farmers who are cultivating dry ranches, we offer a few suggestions. Do not calculate upon putting the whole farm in grain, but only such portions as you may have reason to believe will stand the best show of producing some crop should the season be dry. That portion which you propose to leave for volunteer and pasture, it would be well to harrow over thoroughly, and cross-harrow again, as soon as convenient to do so. A mulching upon the surface, such as the dry earth would make by harrowing, would tend to prevent the further evaporation of moisture from the soil, and the moisture from a great depth below the surface would diffuse itself equally under the harrowed surface, so that when the first rains would sprout the seed it would have a better chance to take root and grow. Even such land as you intend to plow and seed next Fall, it would be a good plan to harrow in this way, for reasons above given. Of course, where the stubble is now of much value for pasture, it would not be economy to destroy it. But there is much land on almost every farm that will not be pastured to any paying extent. We strongly advise every upland farmer to make plans to summer-fallow a portion of his land next season.

HARVEST CLOSELY.

As to harvesting grain this season, we would advise skimming as closely as possible, where it is light. Make seed and feed for yourselves if you can. We know of some farms in our Santa Clara Valley that will have hard work to yield that much this season. Save, also, all the hay and straw possible. Don't lose a straw if you c n help it.

NOW A WORD ABOUT STOCK.

Make plans to fatten and sell or put into the barrel this fall every second-class beef animal you can spare from the farm. Leave none but the best cows and other most valuable animals to keep—none but what you know your farm can safely carry over a hard year or two. You may think that taking a scare before you are hurt is a poor principle; but even if it is a good season next year, such a thinning out will not be bad, for you can then purchase some better animals to take their places, which will always pay in the long run anyway. *Apropos* to this subject, we quote from the *San Mateo Gazette* some interesting facts and suggestions:

The meteorological records of the State prove that California has experienced seasons of drouth which have been terrible in their results. They have occurred at long intervals of time, before as well as since the American occupation. They entailed no loss of human life, so far as we are aware; but vast herds of horses and cattle were lost. In some years the grass crop entirely failed, and thousands of cattle were killed for their hides and tallow, the carcasses being left on the plains for the vultures and coyotes.

Don Andreas Pico, an eminent native Californian living near Los Angeles, during various years of drouth prior to 1851, drove thousands of wild horses over cliffs a hundred feet high into the sea. In those years the crops totally failed for the want of rain, and the California rancheros were compelled to destroy their horses in order to save as much pasture as possible for their vast herds of cattle. But even this expedient often failed to save their stock of sheep and cattle. They perished by thousands for want of the life-giving water. Much suffering ensued among the people. This country was then sparsely settled. When its rising population approximates to the millions, as it surely will at no distant day, we can readily see that the occurrence of one of the long drouths peculiar to California would be attended with disastrous results. It has sometimes happened that for one, and even two, years no rain has fallen in California. Suppose that such a thing should happen next year or in 1877; our wheat exportation would cease and agriculture receive a blow from which it would take a long time to recover. All our great interests would suffer a temporary paralysis, and millions would be lost our young commonwealth.

IRRIGATION NEEDED.

"Necessity is the mother of invention," and this contingency of a drouth, which has so often happened here, ought to stimulate our inventive genius and induce us to devise some method of general and permanent irrigation—something that will make us independent of the capricious elements, and secure for us and for coming generations an unfailing supply of pure water. The Legislature ought to invite from our citizens plans and specifications for a general system of irrigation; with the understanding that a prize of money shall be paid by the State to the person whose plan is approved and adopted. This would bring men of inventive talent into the field, and would secure for the successful proprietor a fame more indestructible than silver and gold.

Irrigation is a subject that is now claiming a good deal of attention in some portions of the State, but much more is required to be said on the subject. There are many places so situated that a copious Summer irrigation would be impossible, without an immense expense, where

WINTER IRRIGATION

would pay, and could in all ordinary seasons be practiced. We know of many farms in our valley that might have been soaked with water last Winter, and would have had good crops, where now but little either of hay or grain will be cut. In riding through these districts we notice that along the side of roads and in little sags where the water settled in and soaked the soil, that the grain stands high and looks first-rate, while the rest of the fields are dried up, without heads, and not over six inches high. This shows conclusively that a little more water, or at least a plenty of water during the rainy season, would have insured the crops. It is very poor soil that will not make a good crop if it is once thoroughly soaked with water. We feel more than confident that if the farmers of our State fully appreciated the advantages that must follow Winter irrigation, they would not rest until every little stream that runs across our valleys was led upon the lands until they were filled with water and good crops insured.

The fertilizing materials that would be deposited upon farms in this way from the wash and drainage of mountain lands would keep farms thus watered perpetually fertile, and alone well pay the trouble and expense of such a system. Can any farmer dispute this point?

THIN SOWING.

Our attention was called by a practical farmer to one little fact which is worth the consideration of all grain raisers. We saw spots in a dried-up field where the grain run up and looked as though it would make good heads, that could only be accounted for by being seeded thinner than the rest. There were not so many stalks to sap the moisture, in other words, were less to divide the moisture between, and consequently each one had more to itself than where the grain was thickly sown. This thing the same gentleman has noticed for several years, and asserts that thin sowing for dry seasons is the thing. It takes less than one half the seed usually sown, not so much expense on a risk, and even if the season should be a wet one will stool out if sown early so as to produce about as much as if sown as thick as usual. When dry, thin sown does not stool out much, but makes full heads when thick sown grain would dry out completely.

One thing more, which we have often repeated already: remember that *thorough* surface cultivation is needed to withstand the effect of drouth in our dry climate.

Deadly Insects.

The buffalo gnat is credited with occasioning a wide-spread mortality among the horses and mules of east Tennessee. Many farmers have lost all their stock at a season of the year when they can least afford to do without them. The bite of this insect seems as deadly as that of the African tsetse, the pest of all travelers in Africa. Man and wild animals appear to be invulnerable to the tsetse, but camels, dogs, oxen and horses cannot long survive its attacks. In one expedition Dr. Livingstone lost forty-three oxen from this cause. He was inclined to believe that the ass was bite-proof, but the experience of his last journey convinced him that he was in error. The donkey, though not so susceptible as some of the other animals above mentioned, still succumbs to the little brown fly with yellow stripes. Its proboscis pierces the skin of its victims, and draws thence a plentiful supply of blood. No special harm at first seems to have been done, but in a few days the eyes and nose of a bitten animal begin to run; a swelling makes its appearance under the jaw; the muscles grow weak, and finally the digestive organs are disordered and death soon follows. When dissected, the cellular tissue under the skin is found to be injected with air, as if soap-bubbles were scattered over it. We have not received full details of the operation of the Tennessee insect, but whatever it is, its ravages are quite like those of the tsetse.—*Cincinnati Gazette.*

He that composes himself is wiser than he that composes books.

AGRICULTURAL AND GRANGE MATTERS IN THE SOUTH.

Any reliable intelligence of the agricultural condition of the Southern States we regard with interest. California seems more nearly related, in resources, climate and productions to the South than to the North. The South has depended for success upon growing articles for export, and California tends to the same direction. The consequence to the South of the one-crop system has been most disastrous, and her only salvation is to inaugurate a more diversified system of agriculture, and this her people are not yet educated up to. They know nothing but cotton, as many of our farmers know nothing but grain, and they purchase from the Northern States the common necessaries of life, which they might with economy produce at home. While divided by distance and non-communication they were also subjects of sharpers in the shape of cotton speculators. The Grange will remedy this matter to a great extent, and in meeting together, discussions upon farming matters will gradually educate the farmers to adopt and follow a diversified and more practical and economical system of agriculture.

J. W. A. Wright has just written a good letter from the South to the San Francisco *Chronicle*, on Grange matters in the South, from which we select the following:

In the Southern States generally, there is no question that the Grange, in its many subordinate and State organizations, is greatly advancing the interests of agriculture by the practical accomplishment of some of its noblest purposes. Throughout the Southern States more than ten thousand subordinate Granges—nearly half the number in the United States—are combining all agriculturists in all the fraternity and strength of our Order for the protection of those interests of agriculture which are common to every State, regardless of any partisan or sectional differences.

Not only is their real community of interests more fully discussed and understood—not only is more complete social enjoyment secured, but the fields are more carefully fertilized and more thoroughly cultivated. The harmonious and sympathetic work of the Grange throughout the Union has given our Southern brothers generally new-born hopes for "a better day coming." And surely they need that better day as few farmers in the world can need it. The chief business enterprise into which they have been led by the principles of the Grange is a combined movement in Georgia, South Carolina and Alabama, in which other cotton States will no doubt soon join, for direct shipments of cotton to Europe by the Granges. Southern cotton buyers have been paying better prices the past Winter than formerly. This is no doubt to be accounted for chiefly by two facts—this movement toward direct shipments and the decreased number of bales raised last year, the crop of 1874 in the cotton States being now placed at about 3,600,000 bales. This latter fact is also due in great measure, as is well known, to the Grange work; for Southern farmers generally adopted the advice given them by the St. Louis meeting of the National Grange, to plant less cotton and more corn. So there is no doubt of the favorable influence of the Grange, directly and indirectly, in securing better prices for cotton growers the past season. They have also, as a general rule, been paying less for the transportation of their produce to market, and been receiving greater accommodation from commercial men, many of whom here, as everywhere else, bless the Grange—over the left—with a slight gritting of the teeth, while ready to admit that it will be a great benefit to farmers, so long as they are true to its purposes and restrain themselves within proper bounds.

In Alabama, where almost every farmer is a Granger, the State Fair next October will be conducted under the management of a committee of the State Grange. Premiums are offered which must tend materially to improvement in systems of culture. No American citizens rejoice more at the growing "era of good feeling," are more patriotic, or more willing to do everything in their power to aid in bridging over, sincerely, effectually and forever, the "bloody chasm," than are the Grangers of the South. It is only necessary "to meet them half way."

As I came through Tennessee, where you know there are now over one thousand subordinate Granges, I met with some prominent members of our Order in that State. They assert that the purposes of the Grange are working out the same benefits for farmers there as in other States. One little special item for which the Grangers have credit there is the securing of a small and apparently insignificant act of their Legislature last Winter in the interest of sheep-raising. It is nothing more nor less than a "dog-law." It fixes a fine of five dollars on one kind of dog, and one dollar on another kind. Collectors of the poll-tax are expected to collect the dog-tax. If the owner of a dog refuses to pay the tax the collector is required to kill the dog at once. This law and its provisions will go far toward freeing the State from sheep-killing dogs, for it will not pay to keep any but good dogs, and if properly enforced it can at least make sheep husbandry profitable. Just such a law is needed in Alabama, Mississippi, Maryland and other Southern States, for, beyond question, there is excellent sheep range in all of them, as well as in Tennessee. If you say to Southern farmers, "You have fine range, why don t you raise sheep?" they reply, "Too many sheep-killing dogs, and we can't get a dog-law." Strange as it may seem, a dog-law is one of the hardest to have passed in many States. Legislators have even been known to urge that if they passed a dog-law it would ruin their party. Strange, isn't it? Still it is true. Now in Tennessee the Grangers have set an example that should be followed in other States. Grange petitions were sent in to the Legislature asking for a dog-law—as much as to say the interests of agriculture demand such a law, and we want it regardless of party differences and dangers. Their Legislators, like wise men, heeded the appeal, and, relieved of all anxiety about the dear party, passed the law, thus paving the way for a great addition to the agricultural resources and wealth of the State.

This single instance contains, as it were, in a nutshell, the principle of Grange influence in legislation, state and national—or a part of its political influence, if one chooses to call it so—for, beyond question, the Grange has a political influence for good, and a powerful one, although it does not propose to dabble in partisan politics nor interfere in the least with the party affiliation of its members.

There are many laws and measures which tend to protect and foster especially our agricultural interests. A part of our Grange work is to discuss and find out, in the harmony and secrecy of the Grange-room, what are such laws and measures. When, by common consent, we find such laws and measures clearly and certainly, it is then the right and purpose of all Grange members, by joint petitions and all other legitimate means, to influence our Legislatures and Congress to pass enactments necessary to secure these general and evident interests. This seems to be a point very much misunderstood in regard to our Grange work. By bearing these facts in mind many acts of the National Grange at its Charleston session can be better understood and properly appreciated by some of our members as well as outsiders.

Little and often fills the purse.

INTERNATIONAL EXHIBITION AT PHILADELPHIA, 1876.

Circular of the Bureau of Agriculture.

The Centennial Commission, realizing the importance of the agricultural interests of the United States, and anticipating the demands that will be made for a proper representation in the International Exhibition of 1876, is making ample provision for the accommodation of this department.

It has been organized as one of the bureaus of administration of the Exhibition, and will comprehend the native and cultivated products of the soil, and of objects more directly derived therefrom, agricultural machinery and farm appliances.

The building, most eligibly located in Fairmount Park, will cover ten acres. There will be provided, also, ample and suitable accommodations for the shelter and display of live stock, which it is intended shall be exhibited during the months of September and October.

The Exhibition will open on the 10th of May, 1876, and it is therefore necessary that those who desire to exhibit cereals, forage-plants and tubers should make their preparations during the present season.

This exhibition being international, will bring together for comparison the best products from every quarter of the globe; hence every effort should be made to give just evidence of the capacity of the varied climates, soils, skill in tillage, and the character of the live stock of the United States; whilst the mechanical aids to agriculture should exhibit ingenuity, excellence of workmanship, and adaptation to desired ends. The classification will more fully make manifest the arrangement and comprehensiveness of this department. Applications for space should be made as early as practicable, on forms which will be furnished by the Chief of this bureau.

The prompt co-operation of state, county and other agricultural organizations, as well as of all individuals interested in the practice of rural science, stock-breeding and forestry is earnestly solicited.

COMMITTEE OF THE CENTENNIAL COMMISSION ON AGRICULTURE.

Robert Lowry, N. C. Meeker,
Lawrence Weldon, Robert Mallory,
Eldridge W. Little, Archibald Cameron,
Andrew J. Dufur.

RESIDENT ADVISORY COMMITTEE.

A. L. Kennedy, M.D., Paschall Morris,
Charles R. King, M.D., Wm. B. Roberts,
John R. Eby, Lewis Weldin,
George Blight, William Brice,
Thaddeus Norris, George I. Young,
Chas. L. Sharpless, John I. Bishop.
Samuel C. Willetts,

Burnet Landreth,
Chief of Bureau of Agriculture.

A. T. Goshorn,
Director General.

LIVE STOCK AT THE CENTENNIAL.

It is understood that the Centennial Commission has concluded to have the live stock display at the International Exhibition, within the months of September and October, 1876; the periods devoted to each class and family being fifteen days, and the division as follows:

Horses, mules and asses (as one class), from September first to fifteenth.

Horned cattle (of all varieties), from September twentieth to October fifth.

Sheep, swine and goats (as one class), from October tenth to twenty-fifth.

Poultry will be exhibited as a permanent and also as a temporary show, the first commencing on the opening of the Exhibition, the latter from October twenty-fifth to November tenth.

Animals must be of pure blood to be qualified for admission (trotting stock, fat and draught cattle excepted), and even those of pure blood must be highly meritorious.

The exhibition being open to the whole world, it is of the first importance that we bring forward the best of their kind only, as the character of our stock will be judged by the general average of those exhibited.

Exhibitors will be expected to provide for feeding their stock.

All forage and other food will be furnished at cost prices at depots conveniently located within the grounds.

Exhibitors will also be expected to furnish their own attendants, on whom all responsibility of the care of feeding, watering and cleaning the animals, and also of cleaning the stalls will rest.

Though the Commission will erect ample accommodation for the exhibition and protection of live stock, contributors who may desire to make special arrangements for the display of their stock, will be afforded facilities, at their own cost.

All animals will be under the supervision of a veterinary surgeon, who will examine them before admission to guard against infection, and who will also make a daily inspection and report.

In case of sickness, the animal will be removed to a suitable enclosure, specially prepared for its comfort and medical treatment.

Rings will be provided for the display and exercise of horses and cattle.

It is highly important that all who design exhibiting should now make application, as the extent of preparation necessary can only be regulated by an estimate based upon actual demands.

Inquiries may be addressed to the Chief of the Bureau of Agriculture, Philadelphia.

AGRICULTURAL MACHINERY.

The Centennial Commission is making thorough provision for the reception and display of agricultural machinery and implements.

A section of the agricultural hall, an imposing structure covering ten acres, will be set aside for the exhibition of farm appliances, and it is anticipated that this feature will be second to none in the agricultural department of the International Exhibition.

It will be evident to the manufacturers of agricultural machinery that as this our national exhibition, is also open to the competition of the whole world, which has been invited to participate, our past progress and present position will be closely scrutinized, and we shall be judged by the general average. Therefore, the admission of any object will be granted only when it possesses a character of unquestionable worth, and in the case of machinery, under the ruling of the Commission, the elements of merit are held to include considerations relating to "originality, invention, utility, quality, skill, workmanship, fitness for purpose intended, adaptation to public wants, economy, and cost."

Within the agricultural hall will be steam power, and all the necessary appliances for driving all such machinery as cotton gins, sugar presses, plantation mills, threshers, fanning mills, etc.

It is contemplated to test in the field, plows for animal and steam power, reapers, mowers, tedders and hay rakes.

Manufacturers, designing to compete in the field will be required to use the same machines as they offer on exhibition.

The reception of articles within the hall commences on January 5th, 1876, and ends on April 19th, the exhibition opening on May 10th, and continuing six months.

Inquiries may be addressed to the Chief of Bureau of Agriculture, Philadelphia.

POMOLOGY.

It is the purpose of the Centennial Commission of the International Exhibition, and an especial object of interest to the Bureau of Agriculture, which has been charged with the reception of fruits for exhibition, to afford every inducement and facility for a full and complete display of the fruits of our varied climates, and also those of more northern and tropical regions.

It being questionable as to the practicability of exhibiting many perishable fruits, the products of the tropics, models in wax and plaster will be acceptable.

Such a display of pomological products as herein designated will, it is expected, cover the entire period during which the Exhibition will be open, though at all times varying in importance and extent. For instance, berries and other small fruits will be included in this department, and of these there will be certain classes, as strawberries from the South, ready for exhibition on the opening day; and the variety and quantity will be presented in an increasing scale as the season advances.

It will be perceived readily that the most important display will be made during the months of September and October.

The classification, and arrangement of location of fruits sent for exhibition, will be according to their species and variety; all of similar character being assembled together, that a more satisfactory conclusion may be reached as to the respective merits of like products from different soils and States; thus all grapes, from whatever source, will be placed in one position; the same with apples, pears, and the entire list of cultivated and wild fruits, and nuts.

Exhibitors may be assured that the proper arrangements will be made for the united interests of themselves, and pomological science.

It is hoped that the pomological societies of the several States, and individual cultivators generally, will co-operate in an effort to place before the world creditable evidence of the resources and capacity of our country in respect to fruit culture and products.

The Exhibition will open in Philadelphia on the 10th of May, 1876, and close the 10th day of November following.

FORESTRY.

The Bureau of Agriculture of the Centennial International Exhibition, to be opened in Philadelphia, May 10th, 1876, comprises within its department a display of all the products of the forest, both in primary and secondary form.

It is earnestly requested by the Commission that foresters of all sections of the Union forward samples of the trees of their respective districts. These samples or specimens may be presented in any convenient and portable form; as, for example, it is suggested that the bark of one or more of the giant trees of California (Washingtonia gigantea) be taken off the trunk in segments and sections, to be placed on arrival on a skeleton frame of the same dimensions as the original. The agricultural hall having an extreme elevation of seventy-five feet, will afford ample room for at least a partial exhibit of one of these monsters of primeval forests. Thus also with other trees of the Pacific coast, hardly secondary to it, as Abies Douglasii and nobilis, Librocedrus decurrens, Pinus Lambertiana, The White Pine and Hemlock of the North, The Yellow Pine in their several species, the Live Oak, the Cypress (Taxodium distichum) of the South, and a long list from every section of our broad territory.

In addition to specimens of trunks of trees should be exhibited timber and lumber in all forms; as samples of masts and spars, large and small; knees and square timber, as prepared for naval purposes; planks and boards exhibiting unusual breadth and character of cell and fibre. In brief, every description, quality, and form of wood used in construction and decoration.

Foreign specimens are confidently expected —let us not fail to place ours side by side with them.

It can hardly be necessary to add another word. The lumber interests of this country are too important not to be fully represented at the International Exhibition. Few of us, it may be assumed, comprehend and appreciate the lumber resources of the Union, and we can only do so by such an exhibit as is herein proposed, and by the study of statistical tables expressive of value, now in course of preparation.

Communications in connection with this and kindred subjects, may be addressed to the Chief of the Bureau of Agriculture.

HOW SHALL WE CELEBRATE?

As the annual return of our national birthday is so near at hand, perhaps it will be well to say a word in regard to the way in which it should be celebrated. There has been a tendency, for the last few years, to ridicule and burlesque the day, more than to celebrate and honor the act or our patriotic and noble forefathers who risked their lives and fortunes in giving us the Declaration of Independence that spoke our nation into existence. This is not as it should be. Then let us see to it that the coming Fourth of July shall be celebrated in a manner that will not only show our gratitude and thanks to our worthy sires, but that will have a tendency to elevate and refine the rising generation. Is there a man, woman or child, with one drop of true, patriotic blood in their veins, that did not feel insulted and disgraced by the caricatures of Miss Sallie Hart and other temperance workers which were paraded through the streets of San Jose on last Fourth of July? just because she had been brave and true enough to try to stay the tide of intemperance that is not only blighting the prospects of our lovely city, but has proved the greatest curse the world has ever known, even as our forefathers worked against oppression. Parents, "be not deceived; whatsoever ye sow, that shall ye also reap." If we do not provide public entertainment that will elevate and refine the young, that will lead them to a higher phase of civilization, we must not complain if they find and are demoralized by entertainments of the descending phase of civilization; and if we permit decency to be insulted and patriotism to be dishonored upon our streets on our natal day, what must be the result?

Why Ears Should Not Be Boxed.—In *Physiology for Practical Use* (D. Appleton & Co.) we find the following:

There are several things very commonly done which are extremely injurious to the ear, and ought to be carefully avoided. * * And first, children's ears ought never to be boxed. We have seen that the passage of the ear is closed by a thin membrane, especially that adapted to be influenced by every impulse of the air, and with nothing but the air to support it internally. What, then, can be more likely to injure this membrane than a sudden and forcible compression of the air in front of it? If any one designed to break or overstretch the membrane he could scarcely devise a more efficient means than to bring the hand suddenly and forcibly down upon the passage of the ear, thus driving the air violently before it, with no possibility for its escape but by the membrane giving way. Many children are made deaf by boxes on the ear in this way.

SOMETHING ABOUT THE BEET. SUGAR INTEREST.

The beets look well and promise a good crop at Soquel, Santa Cruz county. At Sacramento and at Davisville the prospects are equally good. There are but two sugar mills in the State. We have now had four years' experience in this interesting branch of industry, and it is well proved that we can make sugar from beets in California at 7 cents a pound, including every expense. A reduction to 6½ cents is expected, by letting farmers raise the beets. They can make acceptable profit, delivering beets at $5 a ton, on long contracts.

In Europe, sugar-making from beets is a favorite industry, because of its certain profits. We have great advantages over Europe. Our longer season ripens the beet better and increases its weight. Our milder Winters save two-thirds of the expense of storage, and all other items are in our favor. The free raw sugars of the Sandwich Islands do not affect us materially. With this favorable showing we regret to find a disinclination to go into the business. A gentleman who owns a large farm, and has suitable buildings and water, all accessible to our bay craft, has presented to men of capital an offer so inducing as to tempt any one, if there were not a general apathy toward all industries.

He offers to build works equal to Sacramento for $75,000. Then a working capital of $25,000 would make the investment $100,000.

He does not propose buying land, nor farming beets. Rich farmers will take long contracts to furnish beets to the mill for $4 50 per ton.

He offers to take, and pay for in coin, ten per cent. of the stock; and further, he will guarantee 25 per cent. profit on the investment in the first year, if he be allowed to direct the management for the year. For this guarantee he will accept the surplus over 25 per cent. He will put up security for this.

Every man is interested in encouraging manufacturing here. Nothing seems to insure a higher profit, and with every security against risk. We, therefore, earnestly entreat for this proposition the serious consideration to which it seems entitled.

The foregoing is from the *Alta*. When we take into account the value of the

PULP FOR STOCK,

as well as the juice for sugar, the above calculation will not seem wrong. We excerpt the following in this regard:

After the juice is expressed from the rasped beet, the dry pulp remaining is an admirable food for cattle, sheep, swine, or fowls, of which vast numbers are fed in the sugar-producing districts of Europe. The average amount of pulp is 20 per cent. of the original weight of beets, and it is almost a universal custom for farmers to contract with manufacturers to receive back in pulp 20 per cent. of the weight of beets furnished. For this the farmer pays two to two and a half dollars per ton. If the manufacturer has any pulp remaining after his contracts with the farmers are filled, he sells it to others at two dollars and seventy-five cents to three dollars per ton.

Repeated experiments have proved that for feeding stock, three tons of pulp are fully equal to one ton of the best hay. Cattle are fond of it, and by its use are fattened for the market in one hundred days.

The method of feeding stock upon it employed at Masny, by the Messrs. Fievet, the model farmers of France, was the following:

Each ox was allowed daily 80 lbs of pulp, 5 lbs of chopped straw, 5 lbs oil cake. Each cow had daily 70 lbs of pulp, 5 lbs of chopped straw, 5 lbs oil cake. Each sheep was given daily 6 lbs of pulp, ½ lb of chopped straw, ¼ lb of oil cake, and 1 lb of chaff.

They fattened in this manner 800 head of cattle and 4,000 sheep every year.

The Messrs. Fievet recommended the use of chopped cornstalks and a small quantity of Indian meal for the Western United States.

Chaptal says of the pulp: "This food is almost dry; it has not the advantages of roots or grasses, nor of dry forage. It does not ferment, and is not laxative, like the former, nor does it heat and produce constipation like the latter. It contains almost all the nutritive principles of the beet."

In fact, water is the chief article taken from the beet by rasping and pressing, and there still remains from four and a half to six and a half per cent. of sugar in the the residuum, besides other nutritious matter.

Dombasle recommends it, especially for sheep, and also for milch cows, stating that the quantity as well as the quality of the milk and the color of the butter are much improved by its use.

M. Cail, the wealthy and enterprising owner of "La Briche"—a splendid farm in the department of Indre et Loire—mixes his pulp with chopped straw, in the proportion of five-sixths of the former to one-sixth of the latter. To the oxen, for fattening, he gives 150 lbs of this mixture in the Winter months; to milch cows, 110 lbs; and to working-cattle from 100 to 150 lbs daily.

A liberal daily allowance for an ox is 75 lbs, for a cow 60 lbs, and for a sheep 6 lbs, with chopped straw, and a little oil-cake, or meal. Consequently, if a farmer raises 100 tons of beets, and takes back from the manufacturer 20 tons of pulp, he has the means of feeding, during the five months from the first of November to the first of April, 4 oxen, or 5 cows, or 60 sheep. The manufactory that consumes 24,000 tons of beets provides 4,800 tons of pulp, with which may be fed, for the five most costly months of the year, when there is no pasturage, 960 oxen, or 1,200 cows, or 12,000 sheep.

EFFECT OF SUBSIDIZING THE BEET SUGAR INTEREST IN FRANCE.

In the days when England took a much more active interest than she does now in the "balance of power" in Europe, France began to cultivate beet root, and make therefrom her own sugar. By prohibitory taxes on foreign sugars, an abnormal growth was given to the manufacture of beet root sugar, and in time the supply was in excess of the demand, so that the branch of industry became less and less profitable. To obviate this, France offered an export bounty on sugar, so that on every $100 worth exported the French merchant got possibly $10 allowed him by the Government, and he could therefore afford to sell his goods for $90. The result has been that the French sugar makers have been underselling the English in the markets of England, and the English sugar-makers have now applied to their Government to equalize matters by imposing a tax on French sugars equal to the export premium allowed by the French Government.

The Trespass Law.—We have reliable information that the cattle men in this Senatorial District are actively engaged in laying their plans to elect Representatives this fall of fence proclivities. It is very evident the contest on this subject is not yet ended. They will leave no means unturned, if not to repeal the law altogether, to so modify it as to be of little practical benefit. The good that has resulted from the Trespass Act of the last Legislature, defective as it may be in some respects, has exceeded the expectations of the most sanguine of its friends. It has been the salvation of this valley. All the great and almost magical changes of the past year are due to it, and those that will take place next year, if this law is not tampered with, will be still greater. Let everybody, then, interested in the maintenance of the Trespass Law (and this class comprise more than nine-tenths of our people) be careful who they support for Representative. The agents of evil are always active. Eternal vigilance is the price of safety.—*Kern Courier.*

Educational.

Parts of Speech.

THREE little words you often see
Are articles—A, AN and THE:
A noun's the name of anything,
As school, garden, book, or swing;
Adjectives tell the kind of noun,
As great, small, pretty, white, or brown;
Instead of nouns the pronouns stand.
Her head, his face, your arm, my hand;
Verbs tell of something to be done,
To read, count, swing, jump, or run;
How things are done the adverbs tell,
As slowly, quickly, ill, or well;
Conjunctions join the words together,
As men and women, wind or weather;
The preposition stands before
A noun, as in, or through, a door;
The interjection shows surprise,
As Oh! how pretty—Oh! how wise;
The whole are called nine parts of speech,
Which reading, writing, speaking teach.

Pupil Farmers.

The *American Agriculturist* has some sensible remarks under this head. Are there not some farmers, nurserymen and fruit growers in California who would like boys and young men as apprentices? We know there are a number of likely young fellows who would gladly take situations where the could work and have educational advantages, physical and mental. We would freely and without price publish the names of those who want boys, and of boys who want situations. We would gladly make the California Agriculturist a medium for such intelligence. Send in the names and qualifications. The *American Agriculturist* says:

The old system of apprenticeship had its merits. Although shorn of its ancient usages and bonds it exists to a great and useful extent to-day. That it is gradually coming into use upon the farm is a proof that farming is attaining the rank of an established business in the full significance of the term. Anciently the weaver or "webster," the butcher, the skinner or "fletcher," the smith, the tailor or "taylor," and other tradesmen taught their sons their trades as they gave them their names, and the trade became the property of the family as much as the name. No stranger intermeddled with their trades. Such competition was rarely permitted. But society has outgrown this state of things, and the son, not bound by the ancient tyranny of a parental despotism, leaves the farm for other employments. As he quits the farm so other boys leave their homes and seek the farm, or they would do so if opportunities were presented to them. Such opportunities it was hoped would be presented by the agricultural colleges, but that idea has not yet been realized to any extent. The only resource for such youths or young men is to become pupils of some successful farmer, and learn their business or trade in a thoroughly practical manner, without being hampered with studies for which they have no use. In England and other countries the agricultural journals contain numerous advertisements from farmers who want pupils, and young men who desire to become pupils, and the same system is already originating here. Not long ago a case in which we were the means of bringing master and pupil together, has resulted so satisfactorily to both parties that we recommend its repetition in other instances. Doubtless there are many successful farmers who would receive pupils, and hundreds of young men who would gladly seize upon an opportunity of becoming pupils to such farmers. We so very frequently receive applications from young men desiring to learn stock farming or dairy farming in the West, or general farming in the East, that it would be of great service to them should those farmers [or dairymen who desire to receive pupils make it known publicly through the columns devoted to business matters. But none should enter upon this work unless entirely competent.

Correspondence.

An Alarming Habit and Custom.

EDS. AGRICULTURIST: A London correspondent of the San Francisco *Chronicle* alludes to the curious custom of women frequenting bar-rooms with the same freedom as men. Respectable-looking women, with their prayer-books, stop on their way from church, call for whatever drink they like, and enjoy it with a cracker. In hiring a servant, too, the custom prevails to agree to furnish a certain amount of beer daily, or to pay them a stipulated sum as beer money.

A mass-meeting was held on Ash Wednesday in one of the theatres to discuss the propriety of opening museums and other places of amusement on Sunday in order to win people from the drinking saloon or public house. One speaker argued that it was impossible to induce the people to give up any enjoyment without offering another in its stead.

Can it be possible that the opening of places of popular resort for amusement will lessen the sale of stimulating drinks? The one calls for the other; and in a country where both sexes patronize the bar, surely they would not pass them by without their patronage in going or coming from the museum or other place of amusement.

We Americans should be charitably inclined towards those whose taste for fermented or spirituous liquors comes to them from both father and mother for generations. Our duty here in cosmopolitan California should be to help the dear children of such parents to overcome their inheritance, which is often a source of grief to the parents, but which they find it impossible to cure in themselves.

SANTA CRUZ, May, 1875. NELL VAN.

[We also ascertain on good authority that ladies in San Francisco are learning to smoke tobacco as a fine accomplishment, and say that it is "the thing" in the *elite* of society! What next? Ladies drinking and smoking like men! Well, if it is good for men it ought to be good for women and children. Who is setting the example?—EDS.]

ARTESIAN WELLS.

Do They Drain Our Higher Lands?

EDS. AGRICULTURIST AND LIVE STOCK JOURNAL: That artesian wells are of great local benefit cannot be doubted; but whether they are not injurious to at least those parts of land in the vicinity which cannot be irrigated by them, is, and must be, a question of sufficient importance to be worthy the serious consideration of the agriculturist.

To assist in this inquiry, it will be necessary to compare the nature and productions of those parts of Santa Clara valley called high and dry lands before artesian wells came into existence with what they are now. It is well remembered by many of us when those lands produced all kinds of vegetables, particularly potatoes and onions of the largest size: beans, corn and melons planted in June or July produced excellent crops. Some say that the change came through exhaustion of the soil, but the farmer knows that new and rich spots are equally unproductive of anything but grain. We also remember when the and along the Alameda was so swampy even in the Summer months as to be nearly unfit for cultivation, and we further remember that in those times the very dryest soil, when pulverized in midsummer, soon became moist enough to sprout most kinds of seed. Now soil well prepared by flooding will dry out before the little plants are large enough to permit irrigation. This, of course, is not so on those low portions of the valley where all the upper waters must collect and press to the surface, while those higher parts, even with artesian wells, have certainly undergone a most decided change in their productiveness. Have the cereals escaped the effects of that change? and what can be the cause? I do not know; but I must be allowed to surmise, since I am willing to give my reasons. They are this: that no amount of rain would be sufficient for vigorous plant-life without moisture through capillary attraction from those streams and veins coming and running underground from the highest mountains towards the sea, where they have no outlet, and must stand and press upwards, or find vent by forming springs, by which means they perform their natural duty and become of universal benefit. But where they must exhaust themselves through so many openings as our artesian wells give them, their pressure must cease, and capillary action becomes impossible, and dryness and barrenness, to a greater or less extent, must be the result.

Now, if my theory is accepted, then artesian wells must be considered as a great general evil, and we must be allowed to request the CALIFORNIA AGRICULTURIST to suggest a remedy.

SAN JOSE, May, 1875. K.

Apiary.

The Hen and the Honey-Bee.

BY JOHN G. SAXE.

A LAZY Hen—the story goes—
Loquacious, pert and self-conceited,
Espied a Bee upon a rose,
And thus the busy insect greeted:

"Say, what's the use of such as you,
(Excuse the freedom of a neighbor!)
Who gad about and never do
A single act of useful labor?

"I've marked you well for many a day,
In garden blooms and meadow-clover—
Now here, now there, in wanton play—
From morn to night an idle rover.

"While I discreetly bide at home,
A faithful wife, the best of mothers,
About the fields you idly roam,
Without the least regard for others.

"While I lay eggs and hatch them out,
You seek the flowers most sweet and fragrant,
And sipping, while, stroll about,
At best a good-for-nothing vagrant!"

"Nay," said the Bee, "you do me wrong;
I'm useful, too; perhaps you doubt it,
Because—though toiling all day long—
I scorn to make a fuss about it.

"While you, with every egg that cheer.
Your daily task, must stop and hammer
The news in other people's ears,
Till they are deafened with the clamor.

"Come now with me and see my hive,
And note how folks may work in quiet;
To useful arts much more alive
Than you with all your cackling riot."

L'ENVOI.

The Poet, one may plainly see
Who reads this fable at his leisure,
Is represented by the Bee,
Who joins utility to pleasure;
While in this self-conceited Hen
We note the Poet's silly neighbor,
Who thinks the noisy "working-men"
Are doing all the useful labor.

Bee-Keeping for Women.

The rearing of the honey-bee, the making of honey and beeswax, is now becoming one of the established occupations of many practical business men, not only in our own country but in foreign countries, who devote themselves entirely to the work, and are making it not only a practical but a scientific occupation. And not only men but women are taking much interest in these scientific and practical researches. There are many women who, within the last few years, have not only added to their store of pin-money, but have gained much useful knowledge, beside enjoying a pleasant out-door exercise, by raising and tending bees. But in order to become a successful apiarian it is of the greatest importance to be a lover of bees, for no business pays that a person has not interest enough in and a love for, to attend to it properly. No doubt many fail in their attempts to raise bees from the fact that they are not properly located; for bees, in order to do well and store large supplies of honey, must have a good supply of honey-producing trees and plants within short range. I used to be a little skeptical when I read Mr. Hosmer's accounts of his enormous yields of honey, but when I visited his apiary last season I no longer had a doubt as to the correctness of his reports, for he really has a very desirable location for his apiary. It is often said that the reason that women do not succeed better in what they undertake, is because they lack energy and perseverance. Perhaps it may be so in some instances, but there are women endowed with noble gifts and possessing the requisite amount of busiuess tact to succeed in any legitimate business when once they have taken hold of it. And bee-keeping seems especially adapted to women, because it requires patience and constant attention rather than strength; then again, bees are great lovers of cleanliness and purity, and there seems to be a hidden quality in some men which renders them disagreeable to bees, and tobacco users and whisky drinkers are said to be very offensive to them, and they are very apt to punish them if they come near.

The superiority of the Italian over the common bee of this country is now pretty generally admitted by all who have tried them. This is especially said to be true of California, where it is said that they yield three or four times more honey than the common bee.

There are women gardeners and florists, who have risen to prosperity by commendable industry and good business qualities, so we hope to see many more giving their attention to bee-keeping. Many with limited means can get a few stands of bees and in a few years make quite a profit with a very small outlay, besides always having a supply of pure white honey for the table. We should say to every woman who enjoys out-door exercise, go to bee-keeping.—*Kate in Bee-Keeper's Magazine.*

BEES IN THE UNITED STATES.—There are two million bee-hives in the United States. Every hive yields, on an average, a little over twenty-two pounds of honey. The average price at which honey is sold is twenty-five cents a pound; so that, after paying their own board the bees present us with a revenue of $8,800,000. To reckon in another way, they make a clear gift of over a pound of pure honey to every man, woman and child in the vast domain of the United States. Over twenty-three and one-third million pounds of wax are made and given to us by these industrious workers. The keeping of bees is one of the most profitable investments that our people can make of their money. The profits arising on the sale of surplus honey average from fifty to two hundred per cent. on the capital invested.

A little more than six months ago John Killop, of Butte county, says the Oroville *Mercury*, bought one thousand head of sheep. A few days ago he sold, as the Spring clip of wool, $1,280 worth. He has a few more than one thousand lambs, that will give him a fleece from each this Fall. His one thousand fleece from each this Fall. His one thousand sheep have nearly paid for themselves already.

The Horse.

Russian Horses.

THE Russian horse is an animal of remarkable qualities, which are set forth in a manner to make us wish for his better acquaintance. Fast driving holds a pre-eminent place among the sports of the Russian gentleman. No expense or trouble is deemed too great to gratify his fancy in that respect. A good pair of fast trotters of a favorite breed sometimes bring as much as £1,000, a price which is looked upon as stupendous by the author, who has evidently never heard of the costly stud of our turf-compelling townsman, Mr. R. Bonner. These horses are fine-looking animals, but are only fit for town use. They are always driven without blinders, for it is the faith of every Russian coachman that if you give a horse a chance to look around and examine every object before him he will not shy. The post horses are unmatched in the world for swiftness and endurance. Another kind of a horse, and devoted to a peculiar service, is thus described: "The Tcherkess of the Great and Little Kabardah breed, is a splendid race of horses. Brought up in the wild steppe, amid dangers and nightly alarms, its apprehensive sagacity becomes early developed in a high degree. It is a fine animal, with a strong spine, powerful croop and thigh, and great width of shoulder and chest; the knee-caps are broad, the hoof as if formed of iron, head and neck tolerably light; everything seems combined to render them trusty, indefatigable servants to man. The Tchetchents, the most ferocious and determined brigands of the Caucasus (now fortunately only in small numbers) used to buy their horses in the Kabardah. They pick out the most promising one-year-olds, take them home, where they are, so to say, received into the bosom of the family. They receive their food when the latter sits down to a meal, and they often sit in the same room. The young children will play with them, talk to them, and crawl all over and about them. What wonder if the horse become almost as wise as his master? The young boys will sometimes mount him and gallop over the prairies, but no adult thinks of bestriding him before he has finished his sixth year. His bones have then become firm and fully developed, his sinews and feet are steel, his wind is invincible. He knows his master's voice and look—nay, he has some notion of his character. His nerves have from his birth been finely tuned to the sound of dangers or mysterious enterprise. It knows when its brigand master is on an expedition of risk and unlawful daring. A whispered word sends him down into the high steppe weeds or bushes, situated near road, at a place where the latter is difficult, where a convenient ditch is at hand to receive a carriage and its human freight. In breathless silence, both wait for what may turn up. The ears of the Tchetchentsian Black Bess slily move to every waft of the light wind, and, before the man can hear the slightest sound, he sees by the demeanor of his steed that business will soon be at hand. Hark! a faint sound of the postal bell (fastened to the pole of the vehicle) strikes his ear; he feels of his gun, his pistol, his razor-edged sword, the large dagger (kinchal), and breathlessly awaits the approach of the travelers. Not a single thought bestowing on the probable number or quality of the foe, he stands over his horse which slowly gathers his feet beneath him. At last the moment for action has arrived. The carriage is just at the right distance from the ditch or other accidental difficulty of the road—a soft touch, and man and horse are up. With the bound of a tiger the horse pounces upon the leaders, attacking them with hoof and tooth. Simultaneously the rider has fired at the driver; mad with terror the post-horses have jumped off the road, precipitating the carriage into the hole, and before its inmates have time to feel for their revolvers they are eased of at least part of their property, and may thank God if they have not broke neck and limb in their fall. Before they recover from their fright, the Tchetchent is already several miles on his gallop home. He has a hard ride before him, and he, as well as his cunning quadruped, knows it full well; for tomorrow there will be an inquiry about where Muhammed, or Arsslan Bey, or Moussa were that night. With a calm smile, our brigand friend replies to the Russian Grado-Natchalnik's question: 'Where should I be but here? The robbery was committed near the Akhonkskoy Stanitzi, 120 versts (80 miles) from here, and what? at 8 o'clock you say?—why, I was here at 12, as I can prove, and I could not ride that distance in three hours.' The officer, up to Tchetchent's tricks, and anything but satisfied, turns to the steed to discover from his appearance the effects of so severe a ride; but the nag is quietly eating his corn, and looking as contented and playful as if he knew that his master's safety depended on his brave bearing."—*From Review of C. W. Wahl's "The Land of the Czar."*

How to Know the Age of a Horse.—The colt is born with twelve grinders. When four front teeth have made their appearance, the colt is twelve days old; and when the next four come forth it is four weeks old. When the corner teeth appear, the colt is eight months old; and when the latter have attained the hight of the front teeth, it is one year old.

The two years colt has the kernal—the dark substance in the middle of the tooth's crown—ground out of all the front teeth.

In the third year the middle front teeth are being shifted, and when three years old these are substituted for the horse teeth. The next four teeth are shifted in the fourth year, and the corner teeth in the fifth.

At six years the kernal is worn out of the middle front teeth, and the bridle teeth have now attained to their full growth.

At seven years a hook has been formed on the corner teeth of the upper jaw; the kernal of the teeth next to the middle fronts is worn out, and the bridle teeth begin to wear off.

At eight years of age the kernal is worn out of all the lower front teeth, and begins to decrease in the middle upper fronts.

In the ninth year the kernal has wholly disappeared from the upper middle front teeth, the hook on the corner teeth has increased in size, as the bridle teeth loose their points.

In the tenth year the kernal has worn out of the teeth next to the middle fronts of the upper jaw; and in the eleventh year the kernal has entirely vanished from the corner teeth of the same jaw.

At twelve years old, the crowns of all the front teeth in the lower jaw have become triangular, and the bridle teeth are much worn down. As the horse advances in age, the gums shrink away from the teeth, which consequently receive a long, narrow appearance, and their kernals have metamorphosed into a darkish point, grey hairs increase in the forehead, over the chin assumes the shape of an eagle.—*Rural San.*

Weaning Colts.—Since replying to the question of a correspondent in regard to the feeding of a colt about to be weaned at three months old, in which we stated that in our opinion that was too young, we have met several large and successful breeders of horses and inquired of them as to their practice in this respect. The youngest age set for weaning was four months. One of them was clearly of opinion that, on the whole, Fall colts were the best, because they could run with the mare all Winter without the risk of getting stunted in their growth, as they would have the advantage of fresh grass in about the time of weaning in the Spring, so that they would keep growing right along, while if they are foaled in the Spring it is quite difficult to get them through the first Winter without getting some check to their growth, getting them pot-bellied or otherwise out of shape.

If weaned in the Fall, at say four or five months, they feed some oats, from one to two quarts a day and a bran mash frequently or some similar succulent food made up of shorts and cut hay. All concur in saying that it is very important to guard against any check in the first year's growth. They want to give plenty of exercise and plenty of nutritive, muscle forming food, like oats, shorts, bran, etc., and all concur in opinion that three months is too young to wean at this season of the year. This is a pretty important point and we should like to see it discussed.—*Mass. Plowman.*

Horticulture.

The Strawberry Region of the Pacific Coast.

SAN JOSE enjoys the right climatic conditions and irrigating facilities for the production of small fruits in great abundance and perfection. In many localities in our county the soil is excellently adapted to their growth also. Every year is developing, proving and systematizing the business. The locality, in its relation to San Francisco, is just right for economically transporting across the bay perishable fruits and tender vegetables in fresh condition. The time must soon come when all lands suitable for the purpose will be devoted to the culture of strawberries, asparagus, currants, gooseberries, raspberries, blackberries, pie-plant, cherries, tomatoes, etc., for San Francisco and other dependent markets.

We extract from the *Rural Press* portions of a late correspondence upon strawberry culture in our valley, which we find especially interesting:

Ten or twelve years ago the strawberries for the San Francisco market were raised in Alameda county, then some years later they were produced on the little fruit ranches in "the Willows," a body of rich garden land near San Jose on the south; but the strawberry plant requires an abundance of water as well as rich soil, and this had to be pumped from wells by wind-mills or by horse and steam power. This added much to the cost of raising them; besides the wind was not always reliable and machinery was liable to break and get out of fix, so from these vexatious causes the supply of water was often insufficient and uncertain when most needed. In the meantime, while the Willow folks were trying to supply the market with strawberries under these difficulties, they were gradually introduced into the country north of San Jose, which I shall designate as the artesian well region, which extends from the southern limits of the city (which is just within the bounds of this region) northward to the bay, a distance of twelve miles, and from the Milpitas road east of Coyote creek, to near Lawrence station on the west, a distance of six or seven miles.

Here, it seems, the strawberry plant has found all the conditions of climate and soil best adapted to its most successful cultivation—a rich, deep soil with an abundance of water from ever-flowing wells, and the cool, moist air from the bay, necessary to keep the plants vigorous and fresh during all the fruiting season, which extends from early spring to the middle of summer, or until other fruits become so abundant and cheap in the market that it will not pay to pick them.

In this favored region there are already more artesian wells than can be found in a region of like extent in the world, and more

are being made every year as the country improves.

All the strawberries are raised by Chinamen on shares; that is, they plant, cultivate, irrigate, pick the berries and pack them in the chests ready for the market, for one-half the proceeds after deducting the cost of chests, boxes, freights and commission for selling. The landholder furnishes the land, tools to cultivate, water to irrigate and cheap little houses for the Chinamen to live in, as his part of the contract. These contracts are made to extend for a number of years, the Chinamen taking care of the strawberry plantation the year round. Before planting the ground is well prepared and nicely graded, so that the water will pass evenly down the rows betwene the plants, which are set in rows twenty-four inches and eighteen inches apart alternately, and the plants one foot apart in the rows. A little ditch is made in the narrow space between the plants to irrigate them. The wider space is used as a walk while picking the fruit or cultivating the ground.

In former years, when the railroad company had a monopoly of the carrying trade between this valley and San Francisco, the fruit men claimed that they had good cause for complaint on account of high charges and poor accommodations, which led to arrangements that resulted in bringing the steamer "Relief" to their relief, which now makes regular trips between Alviso and the city. Alviso, being located at the junction of the Alviso slough with the Guadalupe river, about three miles from the bay of San Francisco, is a convenient and central point to receive the strawberries and asparagus fresh from the field in the evening, to be delivered at daylight the next morning in the San Francisco market. The steamer leaves Alviso every evening at eight o'clock, Saturdays excepted, and returning leaves the city at nine o'clock every morning, Sundays excepted. The charge for strawberries per chest is 42½ cents for freight and wharfage, the chest returned free. The boat is also fitted up in good style to carry and accommodate passengers, who can hardly fail, under the care and attention of such gentlemen as the captain of the Relief and his officers, to enjoy a ride on the bay of San Francisco. The fare to the city from Alviso is only 75 cents, and from San Jose and Santa Clara $1.00. I mention these facts particularly, as the running of this boat is closely connected with the interests of the fruit men of this valley.

I interviewed or had reports from fifty "patches," amounting in the aggregate to 1,110 acres, and estimating those I was unable to see at 170 acres, which I think is rather below than above the correct number, gives us 1,280 acres within this artesian well region; just two sections, and if all were planted together would make a solid strawberry patch two miles in length by one in width.

If it would be of interest to the readers of the *Press*, I could give a list of the names with the number of acres each had, but presume it would not be worth the space occupied. Suffice to say, Mr. C. E. Wade has the champion patch for size, 80 acres. James Murphy, 60 acres; William Boots and Judge Thomas, 50 each; Robert Syer, 45; J. Johnson 40; then eight patches have from 30 to 40 acres each; eleven have from 20 to 30 acres; 17 have from 10 to 20 acres each, and only seven have less than ten acres each.

I took note of 166 acres in asparagus, also among the strawberry men. In this deep, rich soil, with plenty of water, it does splendidly; and when San Francisco gets to be a city of a million of people, this little region I have been talking about can easily supply them with all the asparagus, strawberries and cream, and other such nick-nacks that they may want.

It was very pleasant driving over smooth, well-kept roads, among these beautiful California homes; all their gates standing wide open, as if they were not afraid to have you drive in (I do hate getting down to open gates). Some of the farmers here are on new improvements, but many of them have been here long enough to have nice, tasty houses, surrounded with such a wealth of beautiful trees, shrubs and flowers, of fountains of water and nice, smooth drives and walks, as can only be found among the most wealthy and aristocratic people in other countries.

Household Reading.

King and Queen.

THE happiest home I ever saw
Was where a woman reigned;
And yet the man himself was king,
Pray how was this attained?

The wife, who seemed submission's self,
And did her wifely part,
Queened it in an imperious way
Over her husband's heart.

Her chosen throne was in his home,
Her sceptre his dear will.
Her spotless robe and crown his love—
We see the picture still.

Yet like a king that held full sway,
His guarded well his own,
And loved his palace home, made bright
By love, and love alone.

The children, by their mother led,
Her bright example saw;
Obedience seemed an easy thing,
And "father's word" was law.

O, what a pleasant thing to see,
Of all things to be seen,
A home where reigns with equal power
A household king and queen!

A Question of Reform.

BY NELL VAN.

Now while the public attention is being so occupied with questions of reform for our youth of both sexes, is it not worth while for every parent to enquire, what is each one of us doing for our own boys and girls, to render them free and independent beings? Are we teaching them, first of all, to understand the laws of life and how to live healthfully? and along with our boasted civilization and free educational system, to which is being enforced the compulsory education law, are we giving these young people chances to learn any trade or employment by which they can earn anything towards their own support?

It may be there is freedom in the air we breathe which causes the docile partner of man to desire to compete with him in various industries, and no longer sit contentedly, with folded hands, waiting to be sought out for a life companion to man. Her desire is to learn some pursuit by which she, too, may earn the clothes she wears, when the brother who is reared beside her is taught to rely upon his own exertions for a livelihood upon arriving at maturity. Extend a helping hand to each one of these sisters yearning for an honest calling, and enlarge their sphere of usefulness by providing schools of training, where young women may obtain practical knowledge of a kind not found in the ordinary text-books of schools. We want fewer teachers and more thorough-going business men and women to prevail against the "hoodlum element," now becoming so formidable in our very midst. Even daughters of the wealthy are heard to say they wish, from their hearts, circumstances would admit of their stepping into some congenial pursuit, so that they need not go to "father" for every cent they would spend.

Parents who have the interest or their children at heart should strive for a new order of things, whereby this system of compulsory education shall not be an actual loss, in any way, to the poorer classes. If, along with book-learning, the young waifs were acquiring the knowledge of the skillful use of tools in the workshop, two ends might be served at one and the same time. Muscle exercise would balance the brain power, one being a rest for the other, while upon leaving school the choice of a pursuit or trade would be so arranged that the young person could at once become a producer instead of only a consumer—a worker rather than a drone.

A Chat and a Lunch.

BY ELISA E. ANTHONY.

EDITOR AGRICULTURIST:—I have not kept my promise of sending you an article every month; but a multiplicity of duties and then a flying visit to San Francisco must be my excuse, and I will endeavor to be more regular in my visits to you in the future.

I am not in the mood for sermonizing, neither for anything funny to-day, so will just sit down for a few minutes chat with your readers and contributors.

Do you know, friends, that more of you should contribute to our department of the paper? Now, don't say that you cannot; that you are not used to writing for a paper, and that you have nothing to write about. Every one has to have a beginning, and why not you as well as some one else? Just imagine that you are talking to your friends. Tell them your opinions, your surroundings, facts and fancies. Why, you will have more ideas pouring into your mind than you can write about at once, and you will have to write the second time, and so on—every time it becomes easier.

Write easily and naturally, use short, simple words, and if you wish to write "The house that Jack built," don't say instead, "The domicile reared by dedal Juan."

We all have different ideas and thoughts, and it would be a good plan to exchange the same, would it not? Our sex appear to take but little interest in our department, and it cannot be that they do not read it. Leave off some of the ruffles on your new suit, Emma, and write a short and pithy article to our paper; and you, Sarah, who have had such a wide experience, contribute something to the domestic department; and I hope the hundreds of intelligent women, into whose homes this paper makes monthly visits, freighted with glad tidings, will consider themselves addressed as well as the ones named.

Jewell, Nell Van, I have not seen your cheery articles lately; what is the matter? I hope you have not forsaken us. What would we do without those "Chats" and "Letters?"

My time is up and I will conclude with the following recipes, hoping for some in return:

VELVET CAKE.

Whites of five eggs, two cups sugar, two and one-fourth cups flour, one cup of milk, three-fourths cup of butter, three-fourths cup of corn-starch, essence lemon, two and one-half tea-spoons yeast-powder.

PUFF CAKE.

Two cups of flour, two cups of sugar, one cup of sweet milk, two eggs, two table-spoons yeast powder. Add the milk last.

INDIANA PUDDING.

Two-thirds of a cup scalded corn-meal, one cup of molasses, one-half cup of sugar, two table-spoons of lard, cinnamon, milk, salt. Bake an hour and a half.

TO COOK DRIED COD-FISH.

Soak as large a piece as needed over night. In the morning wash it and dry with a cloth, put lard in the frying-pan, roll the fish in flour and fry till brown on both sides.

Another way is to soak a piece, boil a few minutes until tender, then butter and put cream on it.

PINK COLORED ICING

Is made by adding a few drops of prepared cochineal to the icing—more or less, according to the shade required.

[Our Domestic department is made up this month, but we will allow these recipes under the Household this time, and glad to get them.]

The Dairy.

Treatment of Garget.

Garget is a hardening of the substance of the udder, arising from inflammation consequent upon obstruction in its tubes or tissues; inflammation may precede and be the cause of the obstruction and the the hardening, or they may come from external injury. The udder is divided into four distinct parts, connected only by membranous filaments, so that an affection of one part does not necessarily involve the rest.

Inflammation is a frequent cause of garget in heifers. Previous to birth, and preparatory to the active secretion of milk, there is, as every dairyman knows, a determination of blood to the udder, swelling its blood vessels and tissues, and rapidly enlarging the whole mass. In this engorgement of blood, if there is anything in the way of free circulation, stoppages are easily made. To guard against any unnatural interruption in the circulation at such a time, it is important that the blood should be thin and in its natural condition, and that the udder should be free from external pressure or violence. In heifers this enlargement is not as easily effected as in older cows, and obstructions are more likely to happen at the first birth than afterward.

To keep down the tendency to inflammation and hardening of the udder, heating food like cornmeal should be avoided, or fed sparingly, if at all, to heifers. Nor is it advisable food for old cows at this time. A little oil meal, rye bran or rye meal, may with advantage form part of the food before coming in. They act upon the glandular system, and by their relaxing tendency help to make the circulation free and easy. The refuse of the flouring mill and green food of any kind are excellent for all milk stock at this period.

In cows that have been milked garget frequently arises from leaving curdled milk in the bags when drying them off in the Fall or Winter. I have observed more cases of garget and loss of teats from carelessness and neglect in drying off cows than from all other causes combined. If the milk should chance to become thick, it must be milked out. If it will not come away readily by milking in the usual way, the bag should be rubbed down and manipulated till it is all worked out.

Bruising the bags when cows are giving milk is another cause of garget. Inflammatory action, whether local or general, causes milk to curdle. When a cow's bag is heated so that the bruised part becomes inflamed, the milk which lies in contact with the inflamed part, soon coagulates and stops the passage, which is the more easily done by reason of the swelling of the inflamed part.

In cases which are not very severe, washing the bag two or three times a day with water will be sufficient. Many recommend cold water, but warm is better. Cold water will produce, by reaction, a rush of blood to the parts chilled, and counteract, in part, its efficiency. Warm water will at any time reduce inflammation, by an external application, more rapidly than cold. If the bag is milked out clean, this treatment will generally be sufficient.

In severer cases, internal remedies may accompany the bathing. Poke root, grated and given in a mess of feed, is a common prescription, and, though I can see no reason for its producing any specific effect, it does often act like a charm; and what seems equally strange, cows troubled with garget often show an appetite for it, though they would reject it at other times. Dose, bulk of half a hen's egg. Half an ounce of saltpetre morning and evening, dissolved in the water she drinks, will often render essential aid. When the case is so severe as to need internal remedies, the bag, besides being washed morning and evening with warm water, may be bathed in the middle of the day with liquor of ammonia diluted with some light oil like oil of turpentine, and well rubbed in. This will help to dissolve and scatter the obstructing matter. In such a case the patient should be kept in a comfortable stable and highly fed with laxative food.—*Cor. Live Stock Journal.*

A New Departure in Cheese Making.—Oleo-margarine has been put to a new use the past Summer. A company has been formed and has been engaged since last Spring at McLean, Tompkins county, New York, in manufacturing cheese from milk skimmed at twenty-four and thirty-six hours. The editor of the *Utica Herald* has visited the establishment and gives, in that paper, an account of the process of manufacture. The milk after being skimmed, is placed in large vats where it is heated to the proper temperature for receiving the rennet. The oleo-margarine is received from the Brooklyn factory and is as pure and clear as can be made from clean tallow. It looks, when melted, like a rich golden oil and is added to the milk with enough rennet to coagulate the mass in about eight minutes, during which time attendants keep the milk agitated so that the oleo-margarine will mix with the milk and be seized by the curd as it forms.

While the curd is being cut, more oil is added and as much of it made to adhere to the curd as possible, while the surplus is reserved for use in the next batch. A microscopical examination shows that the mechanical mixture is very intimate, the parts being evenly distributed, and closely resembles the curd made in the usual way.

The editor found about three thousand cheeses on hand at the factory, and, after a free use of the trier, was surprised at the quality disclosed. He says: "There was plainly a lack of fancy flavor, but the way in which the skim milk has been brought to produce a rich, mellow cheese, with a good flavor, is wonderful. It is not right to judge the cheese by the standard of fancy, because if the material of which they are made (skim milk) were worked without the enriching, the result would have been exactly the reverse of fancy. It is difficult to judge the cheese by the standard of skim cheese, because there is scarcely a cheese which shows even a trace of skimming. The curing seems to be delayed longer than in full cream cheese, and the more time given the more perfect seems to be the incorporation of the oil and the smoother and sweeter the body of the product. The cheese at McLean is above the average of the full cream cheese which we have inspected this season, in marketable qualities. The butter which is made of the cream is a strictly fine creamery article. It is made according to the usual creamery practice.

The dairymen in the vicinity, have received better returns for their milk the past Summer than ever before. Ten pounds of milk is called a pound of cheese, and for every ten pounds of milk, the farmer receives within two cents of the highest fancy price of cheese as quoted in the New York market. The business bids fair to be extended the coming season.

Cheese Statistics.—President Fairchild, of the Butter and Cheese Exchange, New York, says the present production of cheese is currently estimated to be about 300,000,000 lbs. The receipts at New York for 1874 were 2,046,575 boxes, and the shipments were 1,639,489 boxes. The exports from the United States ports for the fiscal year ending June 30,1874, 90,611,057 lbs., and the exports from the Dominion of Canada were 23,183,223 lbs., exclusive of the exports to the United States, making a total American export of 113,794,280 lbs.

Butter Taints.—In making butter too much care cannot be taken with respect to its surroundings. In the first place the quality of the cows should be well considered, their comfort consulted by being sheltered in a clean commodious place at night, separated from other kinds of stock. No rough, boisterous helpers should be employed about the premises, as it is well known by careful, experienced dairymen that it not only makes a difference in the quantity, but also affects the quality of the butter.

It is not our aim in this article to enlarge upon butter-making, but to point out the shoals that small farmers run afoul of in their butter operations, and others who deal in it, and finally those that use it.

Butter readily takes up foreign taints and odors, and therefore the greatest pains should be taken to have a place separate and apart from everything else, especially decaying vegetables, kerosene, or any volatile or pungent substances, and ventilation should be well looked after.

The above remarks will also apply to the dealers in and consumers of butter, as a great deal of trouble arises from placing it too near tar, turpentine, coal oil, etc., in stores and dwellings.—*Pacific Grocer.*

Points in Butter-Making.—At the recent meeting of the Vermont Dairymen's Association there was an interesting discussion concerning several points in butter-making. Mr. Arnold was asked how he would build a milk-room for a farm dairy. He replied that where the milk was usually all right and conditions favorable he would need only a cheap tight room, with double walls to enable him to control the temperature. As for setting, he preferred large pans, large enough to hold a whole milking. It is time to skim when the finger can be drawn through the top without having the cream close behind it. When cream will do this it is about ripe enough to churn. When cream foams in the churn it may be cured by warming. Cream should not be churned as soon as taken from milk. It should be stirred together and allowed to ripen all alike. This will occur in twelve hours or so. But cream should not stand until whey is formed in the cream jar.

Stock Breeder.

CATTLE-RAISING IN THE UNITED STATES.

The rapid increase of population in this country tends constantly to advance the price of meats. The Eastern, the Middle States, Ohio, and now Illinois, have in turn found feeding and fattening more profitable than raising cattle. The beef for the great markets of the country must hereafter be raised mainly beyond the Mississippi, even beyond the Missouri, though brought to full maturity and fattened to a large extent in the more eastern corn-growing States. It is not necessary, however, that beeves should be "finished off" East of the Missouri, for there is an immense area of corn-growing land in Nebraska, Kansas, Texas, without mention of large areas of comparatively low elevation in New Mexico and in the southern portions of Colorado, Utah and California. The railroads now penetrating the southwest are furnishing inducements for beef-packing in stock regions, which are by no means disregarded; and they have already commenced a powerful diversion from the business of stock-driving over long trails.

All intelligent Americans have heard of the pastoral region of America, and may have a vague idea of its immense extent. Without mentioning 369,000,000 of acres in Alaska, the area of pastoral States and Territories is 1,196,000,000 of acres, divided as follows:

	Acres.		Acres.
Texas	175,000,000	Utah	54,005,043
Indian Territy	44,154,240	Arizona	72,906,240
Kansas	52,043,520	Idaho	55,228,160
Nebraska	48,636,800	Montana	92,916,640
Dakota	96,536,178	Washington	44,796,160
Wyoming	62,645,068	Oregon	60,975,360
Colorado	66,880,000	California	120,947,840
New Mexico	77,868,640	Nevada	71,737,600

Of all this territory there remains unsold, the property of the United States and Texas, about 1,000,000,000 acres. If we make a liberal allowance for land suitable for tillage, which is mainly found in the eastern halves of the four first-named divisions, and in portions of Oregon and California, and also for water and rock surfaces, and such forests as are dense enough to preclude pasturage—say an aggregate of 500,000,000—there would remain about 700,000,000 of acres suitable for pasturage, and scarcely valuable for anything else, furnishing both summer and winter grazing of the most nutritious grasses of greater or less abundance in the different sections. Here then is a pasture twenty times as large as Illinois, twenty-eight times as large as Ohio, and equal to 120 States like Vermont. And on the area of more than 100 such States the annual crop of herbage is utterly wasted, while the laboring people of Europe are crying for meat, and millions in our own cities are craving earnestly the boon of a single cent reduction per pound in their beef supplies. If we allow ten acres of this unutilized pasturage for a term of five years to produce a steer weighing net 500 pounds, the annual gain in beef at five cents per pound would equal the value of the cotton crop, or nearly $300,000,000. This is but $25 per head, and I have known a sale of 1,000 fat bullocks upon those western plains at $50 per head. These figures are merely suppositions as to the grazing capacity of this area, and can be modified to suit the most conservative views without greatly reducing the magnificent saving which would result from complete utilization of our grasses. A very handsome sum might be added from similar savings throughout the Southern States.

The numbers of cattle on this area were placed at nearly 5,000,000 in 1860 in the census, and in 1870 at nearly 5,500,000. There were at least a million that escaped registry by census officers, as they have a record by local assessors, and the present numbers are not less than 7,000,000. In official estimates they have never been placed above 6,000,000, but constantly accumulating testimony sufficiently proves the existence of fully 7,000,000.

The Texas State returns of 1870 reported 3,651,316 from 118 counties, 41 other counties being marked in the tabulation "unorganized," "no return," or as attached to other counties, and the table itself labelled, "returns incomplete." Most of the 41 are new counties, yet they contain a considerable number of unreported cattle. A greater deficiency still comes from the fact that the most conscientious cattle-raisers return the number which they feel quite sure of finding easily upon the range, and that the less conscientious report the smallest number for taxation that the internal contest between their stupidity and caution and their conscientiousness will allow. Since 1870 the heavy trade in stock driven to Kansas, shipped to New Orleans, or packed, or otherwise prepared, has reduced the actual numbers of 1870, as is claimed by local authorities. In some counties, in which immigration is active, in the eastern and northern parts of the State, this is undoubtedly the case, the large herds being all in the western section. But one county east of the Brazos has 50,000 cattle; there are eighteen west of that river, as follows:

Atascosa	168,764	Jackson	86,542
Austin	58,295	Lavaca	55,335
Bee	60,317	Matagorda	78,311
Bell	54,946	Medina	51,971
Bexar	62,044	Nueces	183,068
De Witt	66,619	Refugio	89,408
Fort Bend	56,833	San Saba	51,925
Goliad	64,750	Uvalde	67,172
Gonzales	75,270	Williamson	50,144
Harris	77,117		
Total			1,445,141

The increase of population in Texas, the encroachments of soil culture upon pasturage, and the extension of cattle-driving and shipment, are rapidly diminishing the proportion of numbers of stock to population. In 1860 there were 485 stock cattle and 99 cows to each 100 of population; in 1870, though herds increased during the war, there were but 374 and 52 respectively, by census computation. The order of precedence, at the former date, of States having more "oxen and other cattle" than people, are: Texas, California, Florida, Oregon, Washington Territory and Nebraska; in 1870 there were only Texas, Florida, and Washington Territory.

States.	1870. Population	To each 100 inhab'ts Milch cows.	To each 100 inhab'ts Oxen and other cattle.	1860. Population	To each 100 inhab'ts Milch cows.	To each 100 inhab'ts Oxen and other cattle.

* Virginia in 1860 is restricted to its present boundaries for the purpose of comparison, and West Virginia in 1870 is compared with the same area as in 1860.

Texas thus had nine times as many cows as Massachusetts in 1860 in proportion to population, and forty-four times as many oxen and cattle; and in 1870, seven to one and fifty-three to one respectively, the disproportion becoming less as to cows and greater as to other cattle. These States represent extremes in cattle supply. The table will furnish at a glance any comparison of sections desired. An increase in both milch cows and other cattle, in proportion to advance in population, is made only in Iowa, Dakota, and Kansas, but the proportion of cows has also increased in New York, Wisconsin, and Minnesota. This advance is due to the growth of the dairy interest in New York, and mainly in the other States to the comparative assumption by stock growing of its proper position in farm economy of the more recently-settled prairie States.

There is a wide variation in prices in different sections of this pastoral area. In the mining territories the demand for working oxen, beef, and milk, not to mention butter and cheese, has generally exceeded the supply, and kept prices well advanced. Texas, with immense herds, without railroads or near markets, is content with the lowest rates known in the United States, and able to supply hundreds of thousands annually, three-year-olds and upward, to the feeders and packers of the States, and younger stock to the stock ranches and ranges of the territories. The following averages, from official returns, represent very fairly these differences in prices of milch cows:

	1875	1874	1873	1872	1871
Texas	$32 19	$35 28	$43 41	$44 66	$46 36
California	29 94	32 48	33 50	34 12	36 82
Territories	13 33	15 25	13 50	14 12	12 83
Other cattle:					
Texas	18 92	19 52	22 71	23 80	26 92
California	17 14	19 46	22 50	23 16	26 94
Territories	7 50	8 02	7 51	8 10	7 37

The variation in prices in different counties in Texas is large, depending mainly upon the comparative prominence of stock-growing and general agriculture. Galveston is an extreme case, the prices of stock of one, two, three, and four or more years old, ranging from $9 to $36. The next highest prices are in Collin, a northern wheat-growing county, claimed to be one of the most fertile in the State, ranging from $5 50 for yearlings to $20 for full-grown cattle. Titus returns $5 50 to $18. In Comanche, a thinly-settled stock-raising county, with a name properly suggestive of Indians, the figures run from $1 to $10. The averages for the State of these four classes are, respectively, $3 18, $5 28, $8 16, and $11 82. The highest price returned in January for cows was $30 in Harris, and $20 in Collin, Ellis and Marion. The lowest figures are $6 in Mason, $8 in Cherokee and Fayette, and $9 in Live Oak. The State assessment of stock cattle is usually about $4, scarcely ever reaching $5. My estimate of present real value is $7 50.

The profit of well-directed stock-growing enterprise in Texas has been large, even princely. It is claimed that it costs less to raise an ox there than a chicken on the Atlantic coast. While money is essential to large and immediate returns, it is, perhaps, true that in no other section of the country can an industrious poor man arrive at competency with so little effort, especially if engaged in stock-growing. I have an account of an old lady in Mason county, who started with several chickens, a pig, a cow, an old pony, and a boy of twelve years to assist her, and who, in five years, attained an annual income ot $2,000 in gold.

Cattle do well in nearly all parts of Texas, from the salt flats on the coast to the mountains, and from the Rio Grande to the cane bottoms of Red River. The pine woods region of the east is less desirable than other sections, having less nutritious grasses, though they are quite sufficient for local requirements. The black-wheat lands of the northern central counties, at least twenty in number, are more valuable for general culture than mere grazing. Western Texas is the chosen home of the grazier, from the mouth of the Rio Grande to the northern limit of "the Panhandle," near the southern line of Colorado—a pasture eight degrees of latitude in length, without fencing or rental, now, as heretofore, full of cattle, having literally "millions in it." Yet all sections are not equally full, immense tracts having comparatively few. The cattle region is west of the Brazos, mostly west of the Colorado, and the favorite locations are in the country drained by the Nueces and Atascosa. The largest herds are in the southern half of this western belt, the more northern counties being subject to incursions from Indians, as well as the more distant and almost unknown divisions, Presidio, El Paso, and the "Panhandle," through which runs the Canadian River. In all this region summer and winter pasture is free to all, the owners of the cattle owning little or none of the land, which belongs to the State of Texas. The cost of raising stock is practically expressed in full in the expense of branding, watching, and gathering for sale. Drovers are accustomed to gather up droves of 500 to 1,000 cattle, three or four years old for brief feeding for beef, and two years old for stock-ranches in Kansas or the Territories. He takes a power of attorney from the owners, authorizing him to drive and sell their cattle, and the hide and cattle inspector takes notice of every brand and ear mark, and classifies them as to age and value, and the inspection is recorded in the County Clerk's office, constituting a legal indebtedness of the drover for every animal thus taken.

The trade of drovers has been very brisk since 1870. On the Old Chisholm trail, from May 1 to November 11, 1872, 292 drovers passed Caldwell, Kansas, with 349,275 cattle, making the average per drove very nearly 1,200, the largest droves being, 4,500 by Little & Perryman, 3,600 by Brooks & Mulligan,

3,400 by G. Van Winkle & Co., 3,200 by Brooks & Gatten, 3,058 by Harden, 3,000 by King & Staples; several at 2,500 to 2,800, and two as low as 350. This will illustrate fairly the size of droves from Texas to Kansas.

I have seen many statements of the size of herds in Kansas. It is impracticable to attempt to name all the large cattle ranches. I will mention a few herds recently reported in my correspondence. On the Gulf coast a Mr. Kennedy has inclosed the "Laurcles" ranch by running a fence fifty miles, costing $100,000, across a neck of a peninsula, thus inclosing by fence and water 169,000 acres. The Rockport and Fulton Pasture Company, on Nueces Bay, incloses 115,000 acres, with a few miles of fencing on one side. Rockport is the great cattle-shipping port for Western Texas. In Refugio county there are large herds: John H. Woods', 17,500; John Linny's, 17,500; J. & R. Dushel's, 9,000; B. F. Gooch, in Mason, 20,000; Barrell Yoloorca, of Grayson, county, has 10,000 scattered over several counties. In San Patricio and other counties, Coleman, Mathes & Fulton, of Rockport, estimate their cattle at 85,007—25,000 in pasture, the remainder on the range. They have made a single purchase of cattle to the amount of $130,000. The Peninsula Company have, near Rockport, a pasture of 35,000 acres, inclosed by a cypress fence. In Limestone county Heaton & Harmer have 8,000 head. In Harris William McFaddon has 18,000, and George Butler 15,000. I have a record of a large number owning 3,000 to 10,000, and there are many more that own much larger herds, were there time to collect and space to print them.

Probably more than 2,000,000 of Texas cattle have been driven into Kansas since the war. The drive of last year was not so heavy as those of the previous years, but has been estimated as high as 175,000. The shipments of cattle over four Kansas railroads, from January to August, 1873, consisting mainly of cattle wintered over, was 102,426; and for the same period in 1874, 122,914, with 115,000 remaining to ship. It was estimated that 50,000 more wintered cattle were taken by government contractors. The drives of one year are either kept on the Kansas or Nebraska ranges till late in the Fall, or wintered over before sending east.

A detailed account of this cattle movement, of the cost of driving and wintering, of the contests with native stock owners arising from fear of the Texas cattle disease, and of the business generally of the cattle grower, would more than fill the place alotted to this chapter. It is a business of manifest importance in the future of the American meat supply.—*J. R. Dodge, in Phrenological Journal for May.*

Sour Milk for Calves.—Farmers, as well as other classes, have yet much to learn about many of the common practices of daily life and experience in their respective callings, and much also must be unlearned to make way for the advanced ideas which science and practical experiments are constantly bringing up for investigation. A few years ago, it was the accepted opinion of the masses of the people that the value of milk as an article of food for man or beast, was principally determined by the amount of cream it contained, and skimmed milk was looked upon as being almost worthless for anything but for pig feeding, and not very good for that.

Later investigations have shown that the greater part of the food material of milk is contained in the skimmed milk; that skimmilk cheese is poor, not because it is devoid of nutriment, but because we have not learned how to make and cure it so as to have it palatable and digestible. Many farmers have noticed that those cows which give milk poor in butter, often raise extra fat calves; and we occasionally find cows giving milk so rich in fatty substances that their calves do not do as well fed upon it as upon milk containing a smaller proportion of cream.

We have raised a few calves every Summer for several years past, and have had excellent success with skimmed milk, both sweet and sour, when judiciously fed. In kindness many are quite apt to over-feed, and they do not feed with the regularity that would be best for the calf. It always makes bad work to let a calf get very hungry and then give it an extra amount of milk, and if the milk is very cold it will be all the more harmful.

Calves are taken from their mothers and fed upon milk which is not only skimmed but often cold, and perhaps given at irregular intervals, and in two large quantities; and because they do not always do as well as when fed in the natural way, the skimming is made to bear all the blame. But it is a fact that very fine calves have been raised on skimmed milk, and sour at that. The subject of feeding skimmed and sour milk to calves was discussed at a late meeting of the Vermont dairymen, and Mr. Stewart, of the *Buffalo Live Stock Journal*, spoke in the strongest terms of the value of skimmed and sour milk for growing good calves.

We also frequently receive letters from the readers of the *Farmer*, giving accounts of very satisfactory experiments in raising calves on such food. We have before us now a letter from a reader at Enosburgh, Vermont, who has a calf, nine months old, that weighs seven hundred pounds, half Jersey and half native, it never having had anything but sour milk and hay since it was old enough to do well on such feed, which has been ever since it was quite young.

During a private conversation upon this subject, with several gentlemen, at the Vermont dairymen's meeting, Mr. Isaac T. Parris of Fairfax, Vt., informed us that he had had the best of success in feeding sour milk to some dozen calves per year. He begins to feed it sometimes when the calves are but a week old. He prefers to have it thick or loppered, but not fermented. At six or seven weeks old, he gives wheat bran with the milk, and at ten weeks, adds oat meal. They learn to eat hay very young, and are often chewing the cud at ten days old. He finds that his best butter cows give milk too rich for calves, and that poorer cows fat the best veal.

Mr. Stillman Stone, of Lunenburg, Mass., is also a strong advocate of sour milk for calves. He says they do not all take to it alike, but when he gets a calf so that it likes it, he has no more trouble with it. We find a great difference in calves about eating whatever is given them. Some calves will take almost any wholesome food with a good and constant appetite, while others are always dainty and particular about what they eat. The latter kind seldom make hardy cows, and when one finds he has such an animal the sooner it is disposed of the better.—*N. E. Farmer.*

Porcine.

Thoroughbred Swine.

THE theory has been advocated, and practice has clearly demonstrated that it is impracticable for the general farmers of the country to become breeders of fine, or properly speaking, thoroughbred stock, with the idea of disposing of it at fancy prices. There may be many reasons ascribed for this, the principal of which is that it takes more time and more capital to start than most of them are in circumstances to afford, to say nothing of the business being a profession which requires more study and experience than most of them can give. The breeding of any of the improved breeds of swine is, however, quite different from horses, cattle, or sheep, and we are fully convinced that every farmer of the country can become a breeder of thoroughbred swine, and make it a remunerative business. Some may say we cannot all sell them at fancy prices, which is very true, neither do they need to do so in order to make it profitable. The man who buys a Short-born cow at $1,000 must necessarily sell her calf at $300 or $400, or the investment will not be a paying one. Such an animal will produce only one calf in a year.

The case is quite different with swine. A farmer at the present day can buy a pair of thoroughbred hogs ready to breed, or any of our improved breeds, at from $35 to $50 per pair, and with ordinary success will produce twelve to eighteen pigs during the year. Thus it will be seen that he only has to sell them at $1 50 to $2 to be making as much on the capital invested as the fancy breeder who is purchasing cattle and horses at $1,000 each and disposing of the produce at $500 per head. Then it is at once apparent to all that the above prices are not as much as can be realized for the common scrub hogs of the country at two or three months old. Then should he find difficulty in disposing of them at that age, it will pay him three-fold to keep them to twelve to fifteen months of age, at which time they will be hogs weighing upward of 300 pounds, which are worth from one and a half to two cents more per pound, than the scrub hogs brought to market.

We ask the careful attention of the reader to this matter; we are not writing from a theoretical standpoint, but from practice of what we write, knowing that such are daily occurrences. These being the facts, why will so many of our farmers persist in keeping a stock of hogs so well known as prairie rooters? Some may say they cannot afford to buy the stock to start with. This excuse will hold good only in but few cases, while the prices of all our improved breeds of swine are so low. The experience of all who have tried it fully attest that the use of thoroughbred males in horses, cattle, sheep, or swine, is one of the best paying investments they can enter into. And if it is so in cattle, then it must be doubly so in swine; and if those who do not believe in thorough breeds will use thoroughbred males of any of the improved breeds on their common stock of cows, it will soon show a marked improvement that will in a very short time pay many hundred per cent. on the investment. Surely no objection in regard to cost can be raised from pursuing this course while the best breeders of the country are offering choice males at $15 to $25 each. —*Alex. Charles, in Swine and Poultry Journal.*

White vs. Black Hogs.—A correspondent of the *Rural Southland* writes:

In my boyhood, some twenty-five years ago, my father had several hundred fine white or light colored hogs. He also had about thirty black hogs of a new and different stock. The cholera came—the first ever known in our section of country—and it reduced his main stock of white or light colored hogs from several hundred to seven hogs; while of the black ones it killed only three; yet all had the same showing, and were equally exposed. I have since noticed something like the same relative difference in mortality, from the same cause.

As to the respective merits of the several black varieties, the two leading and rival breeds are the improved Berkshire and Poland-China, each of which has great merit. The Berkshire under certain circumstances and raised in large numbers, may be the better of the two; but for us, I think it only necessary to know both breeds thoroughly in order to decide in favor of the Poland China. We don't want woods or wild hogs. The Berkshire is predisposed to wildness, and a little neglect makes him as wild and fleet as a buck; whereas, the Poland China, though thoroughly industrious, is the most docile, tractable and intelligent of all hogs.

Generally, we want grazers and not rooters. The Poland China is naturally and essentially a grazer, and the Berkshire a rooter.

Everywhere endeavor to be useful, and you are everywhere at home.

Sheep and Goats.

The Angora Goat Again.

It is natural enough for people living in sections of the country where the Angora goat will not thrive, and where they have failed at it, to think the business of breeding them a failure. But the stock men on this coast know there is profit in Angoras. We give the following criticism, which appeared in the *Prairie Farmer* some two years ago, to show the off side of the goat question:

And now comes Mr. Wm. Landrum, of Messrs. Landrum & Rodgers, of Watsonville, California, "pioneer breeders of Cashmere or Angora goats," who desires to be heard on the "goat business." That Mr. L.'s position may be more fully comprehended, we should also state that the firm is connected with a company who have purchased the Guadalupe island, and propose to devote a considerable part of it and of the capital stock ($500,000) to breeding goats. Whether there are any shares to sell we are not advised. The essential points of his letter, which is very long, are as follows:

He gives the address of several brokers who, he says, can sell, or rather have sold, mohair at from 24 cents to $1 25 per pound, and calls these "full prices." As those who buy, he names Messrs. Sheppard Bros., of Philadelphia, and Messrs. Hall, Broadhead & Co., of Jamestown, New York. He also cites general order No. 92 of the War Department, requiring certain uniforms to be ornamented with mohair cords and tassels, and says the contractors for these goods "must have mohair." These furnish the market for the fleece.

In a former article in the paper to which the letter of Mr. L. is in response, we asked the question whether any one who purchased breeding goats purporting to be Angora or Cashmere, at the prices ruling a few years ago, could now realize for his stock, including increase and wool, and excluding cost of keeping, the amount he paid for the original stock, and stating that if such a person could be found we would gladly publish his address, together with the address of the party willing to buy at such figures. In reply to this the writer presents the names of several who, as he says, have made purchases of goats, principally from himself, within fourteen months past, at prices ranging from $50 to $250 each, and also instances others who, commencing some years ago, have made money in selling goats, pelts and mohair. There is, however, nothing new or valuable in the information his letter affords us on this point, except that there still are parties willing to pay about one-tenth to one-fourth the prices at which these goats were sold in this region a few years ago. Even this, however, is not certain, in view of what he says of the past trade in goats in Tennessee, Kentucky, Illinois and Ohio in the following extract:

"I have carefully watched the Angora goat business for 25 years, and have kept a record of all the pure breeds ever imported to America; their quality, breeding, and to whom sold and their whereabouts, save a very few scattering animals, sold one or two in a place. I also know of many failures and the causes thereof. Also of many successes. There has been two causes of failures: First, like all new enterprises, the majority of people know but little about the business, and designing, dishonest men practiced deception, and deceived farmers with worthless low grades for pure breeds. With such goats they could do no better than make a failure, and without the knowledge of the cause, naturally would condemn the whole Angora business.

"Tennessee, Kentucky, Illinois and Ohio suffered worse than any other states. Williamson and his associates sold over $80,000 worth of grade goats in those States of a cross between the Thibet goat, the Angora and the native goat. Such goats could not be bred up in ten years, with good Angora bucks, to be worth anything for fleece, hence you will daily meet men who will tell you in that country that the Angora is a humbug. They or their neighbors tried them, and paid fabulous prices for them, and failed. Richard Peters, of Atlanta, Georgia, has a small band of pure breed Angoras. I. S. Dicht, perhaps, has ten head; the remainder of his are grades. I could give their history. Robert S. Scott, of Kentucky, has one pure ewe; and three years increased two or three bucks; the balance are grades. Ogden, of Ohio, had one pair of pure breeds. Chenery, of Boston, sold a few pairs of pure breeds to go West, in 1867, that I failed to get the address of, but no lots of over one ewe in a place that I heard of, and I interrogated him very closely at the time; and up to that time I have a record of all the pure breed transactions in America. I assert positively that the failure is not in the Angora goat, but in the deception and dishonest representations made by men about the goat to persons who have no facilities to find out the truth. It is very true that they will not do so well any where east of the Rocky Mountains, as they do on the Pacific coast. Had they not proved to be a great source of profit to the breeder on this coast, they could never have been spread over the country, from the fact, that the word *goat* was unpopular, and attached to it was the history of all the Cashmere swindles in the East, as they were termed. We even have men here now offering grades as pure breeds in this state, and often deceive men with them, to the disgrace and injury of the business."

It will be news to our readers in the States named to be told that the animals for which they paid from $500 to $2,500, a few years ago, were after all only grades, and it is certainly curious that these could not have been bred up by the use of pure crosses in ten years to be worth anything, while even now Mr. Landrum is selling grades at what seem big prices.

In closing he gives the following advice to breeders;

"Accept no goat as a pure breed that cannot be traced to the man who shipped it from Angora. Secondly, all imported goats are not pure breeds. A pure breed goat has no under coating of any kind mixed with his fleece, no coarse main hip locks or kemp; should be clear silver white, and fleece all over alike, belly and breast well covered. Many other points may be considered, but these are indispensable."

The most reasonable conclusion on the whole subject seems to be that some portions, or the rougher and less fertile districts of the western slope of this continent, may be adapted to the profitable culture of these goats, in competition with those countries from which the European and the few American manufacturers of lustre goods from mohair now obtain their supplies of the fibre. The islands of the Pacific ocean may afford still other fields for the enterprise, but there is nothing in the history or present condition of the traffic in mohair or the goats in this country that is likely to attract a careful farmer to the culture of the goat in preference to the culture of sheep. The day has gone by when any man in the central states has any such preference, so far as our knowledge extends.

IMPROVEMENT OF SHEEP.—The improvement of a flock by means of breeding, requires very considerable and long continued care.

The quality of both parents must be considered, both with a view of correcting evils and pepetuating good qualities. It must be acknowledged, however, that in the majority of cases the influence of the male preponderates over the female, and the characteristics of the former are more likely to be impressed on the offspring than those of the latter. This is shown in most animals. The mule partakes much more of the nature and size of its sire, the ass, than of its dam, the mare. A large Cotswold ram put to a Southdown ewe produced an offspring much more resembling the former than the latter, and a pony mare put to a full sized horse will produce an animal half as large again as the dam. Though this, however, seems to be nature's rule, it is not one without exception, for occasionally we see the very opposite results.

In breeding animals of a pure kind, the principal rule to be observed is, to breed from the very best of both sexes, to cull the faulty ones every year, saving only the female lambs for the future flock that are as free from defect as possible. Of course, the flock must be kept up to its proper size, but year by year the finest animals should be selected, until, in the course of time, the flock will entirely consist of them. Until this is nearly accomplished it will not be prudent for a farmer to employ his only tups for the purpose, as he will probably be able to hire or buy superior rams from others, and it will not do to spare some expense in thus raising the character of his sheep.

There are various points that are sought after by breeders, not because of the particular value of those points, but because they are evidence of other valuable qualities, such as aptitude to fatten and early maturity. Thus, in the Southdown breed, small heads and legs, and small bones are esteemed, as they are qualities which are always found connected with fattening properties. Black muzzles and legs are also valued, probably because they denote the good constitution and hardihood of the animal. We must, however, take care, lest, in carrying these points to an extreme, we neglect other valuable qualities. Straightness of the back, breadth of the loins, and rotundity of frame are points that cannot be disputed, and are not merely *signs* of good qualities, but good qualities themselves. The straightness of the back, so perfect in the Leicester, is by no means natural to the Southdown in an unimproved state, but rather the contrary. In the improved breeds, however, it is present, and is justly regarded as an excellent point, giving a better surface for the laying on of flesh, and affording more scope for the abdominal organs. Its converse, too, a round or convex back, is produced or increased by the effects of poverty and cold, and is almost sure to follow if the breed is neglected and exposed.

The development of bone, of course, requires nutriment, as well as any other part, though not perhaps in the same degree. Large bone, therefore, abstracts nutriment which would otherwise be more profitably employed and thus is anything but a desirable point in sheep. Horns, for the same reason, are much better dispensed with. Fine point in sheep, which is justly regarded as extremely favorable, is a soft, mellow feeling of the skin and parts beneath. These parts are the cellular, or rather adipose membranes, which in fat sheep are full of fat, and in lean sheep, when possessing this mellow feeling, denote the plentiful existence of these membranous cells ready for the reception of fat, which is deposited in them almost in the form of oil.

Breadth of loin and rotundity of frame are qualities that require no observation, having been above alluded to. The former denotes the presence of a large quantity of flesh in the spot where it is most valuable, and it also bespeaks a large and roomy abdomen. A round frame is also the sure attendant of a large abdomen, and an extended surface for the muscles of the back and loins. A general squareness of frame bespeaks large muscles, particularly from the quarters.

What, indeed, is wanted, in a good-formed animal, is as much flesh and as little bone and gristle as possible, and this flesh is required where it is most valuable; for instance, it is much more valuable on the loins and quarters than about the head and upper or scrag end of the neck. A large development

of flesh is pretty sure to be accompanied by a disposition to fatten; but for profitable feeding it is essential that these qualities should be developed early—constituting early maturity. Thus talks the *Prairie Farmer* on this important subject.

Gradually Improve Your Sheep.—It is a fact very few persons realize, that by the introduction of pure breed rams, there will be an annual increase of at least half a pound per fleece among a flock of ordinary sheep. "Could our average farmers be induced to believe this," says Mr. Goe, a noted Pennsylvania sheep manager, "sheep profits would soon become immense, compared with present pay." It does not matter where you buy those rams, but you ought to be certain to get pure breeds, from a good healthy flock. From one to three rams annually will not cost much money compared with the profit to your flock and the increased yield of fleece. You all claim to be enterprising and anxious to make sheep-raising *pay*, hence you will doubtless avail yourselves of the light and progress of others in your enterprise; for you live in a progressive age and ought to feel bound to keep on the track. Then it becomes you to open your eyes, look about you, see and read what your neighbors are doing. Catch the proper spirit and profit by all your learn from experience and the experience of others.—*Rural Sun.*

Domestic.

Learn to Keep House.

Beautiful maidens—aye nature's fair queens,
Some in your twenties, and some in your teens,
Seeking accomplishments worthy your aim.
Striving for learning, thirsting for fame;
Taking such pains with the style of your hair,
Keeping your lily complexions so fair;
Miss not this item, in all your gay lives,
Learn to keep house, you may one day be wives.
Learn to keep house.

Now your Adonis loves sweet moonlight walks,
Hand clasps, and kisses, and nice little talks;
Then, as plain Charlie, with burden of care,
He must subsist on more nourishing fare;
He'll come home at the set of the sun,
Hard-sick and weary, his working day done,
Thence let his slippered feet ne'er wish to roam,
Learn to keep house that you may keep home.
Learn to keep house.

First in his eyes will be children and wife,
Joy of his joy and life of his life,
Next to his bright dwelling his table, his meals—
Shriuk not at what my pen trembling reveals,
Maidens romantic, the truth must be told,
Knowledge is better than silver and gold;
Then be prepared in the spring-time of health,
Learn to keep house tho' surrounded by wealth.
Learn to keep house.

Chats With Farmers' Wives and Daughters---No. 6.

BY "JEWELL."

A TUSSLE WITH FLIES.

I have often wondered why a farm life should have so many drawbacks to its charms—the greatest of which is flies; but, as I did not live year in and year out on a farm—which condition, they tell me, is essential to a fair trial of poison and a gentle persuasion each morning with a cloth driver—why, I did not prove anything, only I wondered in my quiet hours why it was that city flies and country flies should differ so very materially. It is quite easy in the city to keep free from flies, if one *knows how and means business*—for you must bear in mind one thing, viz.: that flies *must* be eating. All right; give it to them—with a little cobalt with it—in plenty of dishes here and there, with beer or sweetened water, any way to invite them to eat and be merry, and they will surely die. After a few days of sweeping dead flies, brushing dead flies, shooing dead flies, and seeing dead flies you get used to it, and they either conclude not to come in, or else there are fewer flies in your neighborhood.

So much for city flies. But in the country where there are stables, milk and butter, and swill about to attract flies, they told me it would be impossible. So I am trying it, friends. One week ago, on the wall beside the table and upon the netting over the dishes as we ate would be black as if a swarm of bees were upon us. The reform began by removing the swill barrel to the barn yard. (I'd rather carry sour milk a mile than have so many flies looking at me eat.) I never leave anything for them to eat, but just what I want them to, with cobalt or fly-paper in it, but of that I give a plenty—three dishes to a room, one on each bed in the bed-room, leaving the room well aired and lighted. (I don't believe in dark rooms, except at night.) It seems as if there had been at least several millions of dead flies swept up, and at meals we miss fully that number—indeed, I feel a deep charity for the few left, and feed them regularly, and shall continue to do so right along all Summer. Don't be afraid of your children getting at the poison; teach them to let it alone, and, indeed, the dirty dishes are enough to disgust most all children, who usually like best what is pretty and nice.

Following are a few recipes which may be found useful:

TO COOK CRACKED WHEAT, RICE AND HOMINY.

I have before given a recipe for boiling cracked wheat, hominy and rice in a bag put in boiling water, which is not only easier and a cheaper way of doing—unless one has a waterbath utensil already to use—but I think the bag preferable; the rice keeps its form and cooks quicker, and cracked wheat, to be truly nice, should not cook more than twenty minutes, or three quarters of an hour at the farthest. You then have the full flavor of the grain, and something to *chew* also, which removes one serious objection to mush or cracked wheat, as it is usually served soft and gummy. Hominy should be cooked at least an hour, but cracked wheat and rice is better cooked in half the time.

SOFT GINGER BREAD.

One cup of molasses, 1 of cold water, 1 teaspoonful of salt, 1 of soda, butter the size of an egg, 1 spoonful of ginger, cloves or any other spice, flour enough for a stiff batter; bake an hour.

NANCY'S CAKE.

Two cups of sugar, 1 of milk, ½ of butter, 3 of flour, 2 eggs, 1 teaspoonful cream tartar, ½ teaspoonful of soda.

CREAM PIES.

Two cups of sugar, 1 of flour, 4 eggs, 1 quart milk; boil together and flavor to suit; put in crust and bake.

SPONGE CAKE.

Four eggs, 1 cup flour, 1 cup sugar, 1 teaspoonful cream tartar put in flour, ½ teaspoonful of soda dissolved in milk or water; flavor with lemon.

How to Cook Tomatoes.—Those who are fond of tomatoes will find that among the various modes of cooking them, none can equal in richness and delicacy, a dish of baked tomatoes. We are fond of them served in any manner, but the most delicious dish is produced as follows: To bake tomatoes, take those of a uniform size, smooth and ripe; wash and wipe dry; place them in a deep baking dish, a tin one if it is new; sprinkle salt and pepper over them, and bake in a brisk oven, not too hot, nearly two hours. Spread butter over them, and serve while hot.

Another way. Select thoroughly ripened fruit; cut them in halves; sprinkle over the cut half with bread crumbs, sugar, salt, pepper and butter. Place them in a baking pan, cut side upwards, and bake them in an oven for two hours. Serve on a plate garnished with curled parsley.

Broiled tomatoes can be cooked in less time as follows: Cut medium sized tomatoes in halves, and put them upon a gridiron, cut surface down. When the surface appears somewhat cooked, turn them, and finish the cooking with the skin towards the fire. The cooking should be gradual, so as not to break the skin. Place upon a dish, and put a little salt and a bit of butter upon each half, and serve quite hot.

How Many Farmers Live.—The State of Massachusetts, through her Board of Health, has been looking a little after the farmers of that State, and with regard to the diet of the farmers' families, publishes the following astounding report:

1—Good bread is scarce.
2—There is too little variety in food.
3—Meat is apt to be fried.
4—Baked beans and salt pork too generally used.
5—Pastry and cakes are used to an injurious extent.
6—Too little time is allowed for meals.
7—Coffee and tea are too freely used.
8—Water is used to excess.

The Board of Health make the following suggestions:

"There should be more fresh and less salt meat; less frying and more boiling, broiling and roasting; a greater variety of vegetables and fruits; less pies and cakes; more well-kneaded bread, raised with yeast; less tea.

"It is a somewhat singular fact that farmers live so little upon their own productions. They send their fresh vegetables, fruits, eggs, and poultry, to market, and live themselves upon salt pork, pies and saleratus.

"The poor cooking which prevails, doubtless results from *hurry*—frying requires but little time and skill, saleratus bread can be made in a jiffy, and the bread and pastry we eat are heavy and sodden, because kneading requires time."

It may well be doubted whether a more disgraceful picture could be drawn of any other nation in the world. Here we Americans are boasting of our skill and ingenuity, inviting to our shores the overworked millions of Europe and Asia, and yet living ourselves in a slip-shod, hand-to-mouth way, frying in grease half our food, fried ham, fried beef, fried potatoes, and not a civilized nation on earth but lives better. It insults our nostrils three times every day. The result is, one sees men sallow, stooping, sickly women more than in any other land under the sun. The active habits of the men enable them to overcome the dyspeptic influences of the everlasting *fry*; the women pay the penalty.

Raised Connecticut Doughnuts.—Heat a pint of milk just lukewarm, and stir into a small cup of melted lard and sifted flour, till it is a thick batter, add a small cup of domestic yeast, and keep it warm till the batter is light, then work into it four beaten eggs, two cups of sugar rolled free from lumps, a teaspoonful of salt, and two of cinnamon. When the whole is well mixed, knead in wheat flour until as stiff as biscuit dough. Set where it will keep warm, till of spongy lightness, then roll the dough out half an inch thick, and cut into cakes. Let them remain till light, then fry them in hot lard.

Shakespeare Cake.—Six cups of flour; one of sugar; one of rich cream; eight eggs.

Poultry Yard.

Dark Brahma Fowls.

THE Light and Dark Brahma fowls are among the most popular breeds of poultry known. Side by side, through their excellence alone, they have worked their way into public favor until no poultry yard is considered complete without one or the other of these varieties. As regards the merits of each, there are different opinions. One of our best poultry breeders, W. H. Todd, of Ohio, thus speaks of the Darks in an article in the *Northwestern Poultry Journal:*

For practical purposes we find little difference between Dark and Light Brahmas. The objection to keeping light or white fowls in town in consequence of their plumage getting soiled and dingy, is obviated with Dark Brahmas, as the dust, soot and smoke do not soil their color, and thereby injure their appearance. Comparatively we consider the Dark more vigorous and hardy, better foragers and earlier maturing. Their eggs are more fertile and the chickens seem hardier and more rapid in growth when small than any other of the large breeds.

In setting an equal number of eggs of different varieties in midwinter, the Dark Brahmas have hatched and lived, on an average, 50 per cent. better than any other. When matured, the best specimens are shorter in leg and more broad and stocky in shape than the Light, though we have seen first prizes given to leggy, long, round backed, ungainly birds, for what reason we could not surmise, unless it was for color alone, or else a *special favor* to their owners; but want of symmetry and style does not meet with public favor, and we hope it never will.

Many who keep poultry for eggs and market chaim that Dark Brahmas are the most profitable. The hens make careful setters and good mothers, and the pullets begin laying quite young and continue with scarcely a day's cessation for several months, and especially during the Winter, when eggs are high and "dunghills" are weather-bound. In annual product of eggs perhaps no variety excells them.

CLIPPING WINGS.—Clipping the wings of fowls to prevent their flying is a necessary operation sometimes, but never necessarily disfiguring. It generally is, however, since the farmer's shears almost always make a clean sweep of all the quills, and an ugly wing is the result. Besides the ugliness, there are also other disadvantages in such a sweeping operation. A setting hen uses the outer end of her wing to retain the eggs under her in place, and those near the body protect the skin from being torn by her mate's claws. The proper way is to only trim the feather partly off with a pair of scissors, except about one inch at the end. It shows but little when the wing is closed, and does not disfigure the fowl, and lets the wind through so as to prevent flying.

FRESH EGGS.—Eggs can be kept fresh and good for months by the following method: Place a convenient number in a small basket, and immerse them in boiling water, taking out almost instantly, then pack in salt with the small end down. By this process the entire surface of the white of the egg under the skin-like membrane, is congealed, thus forming an impervious coating, which prevents the evaporation of the contents, and the admission of air.—*P.*

VERY little corn should be fed in the grain, as the same quantity of grain converted into soft food, is worth one-third more than the grain, either for fattening or egg production, as all the force of the system required to digest or grind up the grain in the crop of the fowl, lessens the egg producing qualities or forces.

MANAGEMENT OF GEESE.—I take my pen to reply to Miss Heywood's inquiry about geese in *Rural New Yorker* of March 6. Geese are naturally great wanderers, and for that reason they require a home of their own; especially when harvest time approaches does this need most appear. If allowed to run they destroy much more than they are worth. A small piece of pasture land, through which runs a brook, is best calculated for geese; even if the brook is small, they will love it, and with sticks and leaves dam it up until they have a convenient place to wash and dive; they love to keep clean. Inclose their home with a good fence. During the laying season, which commences as early as March, feed corn, buckwheat, oats, etc.; if cooked and fed warm it is much better. Geese also dearly love crumbs from the table, such as pancakes and potatoes, cut into small pieces and fed warm; feed this once a day, and the above mentioned once a day, as much as they will eat without leaving any. A little salt in their food improves it; also a quantity of loppered milk, if you have it, added after the food is cooked.

If you have no nice little house for the goose to make her nest in, place a barrel in an elevated part of her lot or home, turn it on its side, place the open end of it toward the south; put in a few quarts of horse manure; over this place plenty of straw; she requires enough to lay her eggs upon and cover them with, for she never leaves them uncovered. My word for it, Goosie will not refuse such a place for her nest, at least I never knew her to. She generally lays two litters of eggs each season—from 5 to 12 in a litter. When she shows signs of sitting, give her from 10 to 13 eggs to sit upon; do not let her sit before the middle of April, or, better still, the first of May. Goslings are a tender bird and do not thrive well in chilly weather. After the goose has been sitting one month look out for the goslings; they are of a handsome green color; as they come out of the shell and sit close to their mother they are a pretty sight. About that time the gander will fight as if he meant to kill anything that comes near.—*Bernice Belter.*

SAVE THE FEATHERS.—As the time is drawing near when poultry will be killed in large numbers for market, large quantities of feathers are thrown away which, if taken care of and dried and sacked, could be put away for trimming in the Winter evenings. Then all the chicken and turkey feathers can be nicely trimmed; that is, take a pair of scissors and trim the plume or down from each side of the stem or rib of the feather. This down cut off, if put into a bag and kneaded for ten minutes, is eqal to the best soft goose feathers. Try it and make money out of the poultry feathers.

WEIGHT OF EGGS.—The *Canadian Farmer* says that after careful examination, it has been ascertained that the average weight of eggs was 22½ ounces per dozen, the largest ones weighing 28 ounces per dozen, and the smallest one 14¼ ounces per dozen. I have just had a dozen eggs from my Light Brahmas that weighed 32 ounces. Can any one beat this? The largest one weighed over three ounces.—*E. W. S., in N. W. P. Journal.*

AN OLD GOOSE.—William Atwood, of Big Flats, Chemung county, N. Y., has the old goose "Constitution" now in his possession, said to have been hatched in the year 1803. Her feathering is pure white, her weight sixteen pounds, and her *constitution* unimpaired.

Every man or woman in the land will admit drunkenness to be an evil if they are possessed of good sense, and yet a great many of them close their eyes to the great cause of drunkenness—bar-rooms.

When a man saves his cigar money to buy his wife a new bonnet, and the children new shoes, it indicates a spell of sunshine.

Thinking Farmers.

The opinion still lingers in the minds of many of the ignorant that any fool can be a farmer. Once the notion was universal. Any fool can follow a plow by holding on to the tail, and any fool can plant whatever and whenever he sees his neighbor planting. But to call this farming, or such unthinking animal a farmer, is to libel the first and noblest calling of man. The truth is, as the world is beginning to understand it, it takes as much brains, and brains of as fine quality, to make a first-rate farmer, as it does to make a first-rate specimen of any other business, learned or unlearned. Now we know that none but a man with a good share of live brains can make a first rate farmer.

A new era has been inaugurated in the farming world—the era of thinking farmers. The time has gone by when farmers live by main strength and ignorance. The strength is still needed, but it must be directed by thought. Henceforth, farmers will have to use their heads as well as their hands. The old dig and drudge, hap-hazard mode must give place to labor saving machinery, and an intelligent application of the laws of nature to the wants of the farm.

The first step, and the hardest, is for farmers to learn to think. It is always much easier to work than to think. Indeed, it is astonishing how little real thinking is done in this world, in the ordinary course of working life.

We are not disposed to quarrel with the general results of the system that prevailed under the old regime. Perhapa it was the best that the labor of that time was capable of working. Undoubtedly an immense deal of work was done, as the wealth accumulated was ample proof. But the work was almost exclusively that of man and mule muscles, and not at all the work of brains. But the day of exclusive muscle farming is passed. Henceforth there must be brain work as well. Machinery of all kinds must be called in to save labor. As a consequence, the labor that is used must be more intelligent, better skilled. But neither machinery nor improved labor can be introduced or used profitably, or with satisfaction, by unthinking farmers. Henceforth a farmer must not only know how to work himself, but how to direct others. He must be a man of thought as well as of action. He must study closely the climate and soil that he has to work in, and the markets that he has to depend on. He must have the relative values and adaptablities of the various crops and stocks to his farm, and farm with some definite purpose. He must study out and arrange for himself a rotation of crops adapted at once to the steady improvement of his farm and remuneration of himself and his laborers. And when this rotation is decided upon, he needs must keep his thoughts busy about the numberless little details that make up the current work on a farm. He must plan work ahead for all kinds of weather, so that no crop shall suffer for waiting on other work, that there shall be no conflicting crops; and all the time the farmer must be steadily advancing in knowledge as well as in experience; in judgment as well as practice. The fruits of such a system will be the manifold increase of all the products of the farm, and the elevation of the calling of the farmer to its legitimate rank and dignity.

For the full ripening of these fruits, we must needs depend on time and the young men. The best of the old farmers can but indifferently and with difficulty adapt themselves to new ways; while the majority of those who have passed the meridian of life must, of necessity, continue as they have begun. But in the young men of the farm we have full faith. They will catch the spirit of the age, and with a force of young blood, will develop the ground wealth of this goodly land beyond the most sanguine dream of any muscle farmer that ever lived. This is the work set for thinking farmers.—*Rural Sun.*

Pisciculture.

Self-Sustaining Fish Culture.

We understand any business to be self-sustaining when the necessary or reasonable amount of capital has been expended in its establishment, and the income pays a satisfactory dividend over and above all contingent or running expenses. For instance, it is very little expense to dam up a small stream, and stock it with bass, perch, bull-heads, and some other fish, as they spawn in and around the edges of the pond, and when hatched out will find their way into every nook and corner for protection—places unfit for young trout to live in. Thus perch fasten their spawn to weeds, roots, overhanging limbs of trees, etc. Their eggs are very small, and can no more be counted than the sand on the seashore. In fact they look in a mass like the white of a hen's egg. On the contrary, brook trout lay only a definite number of eggs, varying from 1,000 to 4,000 per pair, according to size and age. Nature has wisely provided them with the instinct of protecting them by burying them in sand or gravel, and if it was not for the fact that they spawn at different seasons (according to age), varying from September to January, and that the old ones lay their eggs first, and that those that come after often (I might say generally), in making their nests, dig up and destroy the first laid eggs, and also that after being hatched the young fry are exposed to numerous enemies, unless screens are placed over them. I say if it were not for these facts brook trout would increase indefinitely. Just figure up an increase of the lowest estimate that they ever spawn, say 500 per pair, and see how long it would take to have a million of trout. Well, now, it is not only possible, but practicable, to so protect the young fry as not only to make the business self-sustaining, but immensely profitable. In the first place, we are not in favor of ponds at all for raising trout for market, as many can be raised in a stream dug deep and wide in the form of canals. Thus the water can be regulated at will.

The only good reason for making ponds is for use by a club for private fishing with a boat. One other reason may be valid in the interior, where feed is expensive. Ponds encourage the growth of insects, and a large number of trout will not only live but grow fat, especially for the first few years, without any other food than what nature provides, as I have learned by experience; but near the sea shore, especially in this vicinity, feed does not cost one cent per pound, so that making ponds here to raise feed is not advisable. It is said that trout will not increase in ponds. This is true, that is, if the springs are all choked and the bottom is all mud. If trout can't find sand or gravel to spawn in they will not spawn at all, any more than a hen will lay when shut up in a dark cellar, or any more than wild animals will breed shut up in a cage. Nature does not do business in that way. A pond raised to its fullest extent, so that no water runs through the flume, will grow fat trout (if sustained by springs), but in that case you will have to buy the young every year to replenish the pond.

To make the pond not only self-sustaining but highly productive, you must not choke the head springs, but dig shallow canals, say two to four feet wide, board the sides, put in gravel, if not there already, and, if you wish to save all, put galvanized wire screens on acanthing, and put coarse gravel on these screens, four to six inches deep. Then when the trout bury their eggs in the ground, they will fall through the screens, and can't be eaten up or destroyed. The mesh in the screen should be five-eighths or one-half inch; put on the gravel and work all the fine through; one inch space between the screen and bottom bed of gravel is all sufficient. Now let in your trout and they will do the rest. Two inches of water is sufficient. If you have not this, put in a board and raise the water. The trout will scale any waterfall in spawning time, if it is five feet high. On this plan it is safe to let the trout remain all Winter, or until they begin to hatch, which, in this latitude, is about April 1 to June 15. It takes about sixty-five days for trout eggs to hatch in this latitude. Of course, the variation in hatching is the same as in spawning. But before the trout begin to hatch the old ones must be removed, and within sixty days after hatching take up your screens and put them on top of all the gravel. Now your young fry are perfectly secure against all intruders. Feed according to numbers and flow of water. The expense the first year is a mere nothing.

I have given directions for feeding heretofore, and I will simply say a spoonful of hopped milk will feed 1000 a day. For the first six months dilute it in a bowl of water and flirt it in with a quill; blood from liver is good. Never feed enough to foul the water. Thus, after things are perfectly arranged, the machine will almost run itself, and six inches of water will produce more clean money than a large farm. I said certain kinds of fish will replenish a pond without any trouble whatever. At the same time their market value may be eight to ten cents per pound, while brook trout average, if fat, fully $1 per pound. I mean Long Island trout, for it is a notorious fact that our trout bring about double the price in the New York market that any others do.—*A. J. Hinds, in New York Times.*

Hygienic.

Insulated Beds.

An insulated bed is one set on some non-conductor of electricity, so the electricity cannot flow to and from it freely. Their usefulness is as yet a matter of experiment. Their value might be tested by invalids, at little expense, for an insulated bed can be made by placing the four feet on strong glass tumblers. Dr. Wagenhols, of Columbus, Ohio, recently read an article on the subject before a medical society, detailing many cases of acute rheumatism which had been benefited by sleeping on an insulated bed. We quote:

"On December 25th, 1871, I was attacked with rheumatism of the ankle and knee joints in one limb, then the other. I treated myself actively by alkalies, opiates, etc., in the ordinary manner recognized by the profession as of most value in this disease. I was unable to leave my bed for three months, could not walk until April, 1872, and did not fully recover until the warm weather in June. On the 16th day December I was again assailed by my tormentor, treated myself as before, 'and I thought myself happy' that I was able to be out of my room in eight weeks, privileged to hobble around the streets of the city with the aid of a cane. Warm weather restored me to health, and during the Summer and Winter I attended to my professional duties. On February 15th, 1874, while I was congratulating myself that I should escape my annual attack, I was suddenly seized in the night time with severe pain in both ankles. In the morning I failed, after an ardent effort, to leave my bed. Fever was intense, as also the swelling of ankle and knee joints. A sense of coldness of the lower extremities existed, which was even more distressing than the pain caused by the swelling of the joints. This condition continued until the morning of the 18th I *insulated* my bed by causing the legs of the bedstead to be placed in four glass tumblers. I fell into a profound sleep, wakening in the morning of the 19th bathed in a profuse perspiration, without the aid of anodynes. I steadily improved, and in a few days was out of my room."

This single case is of little consequence, but the doctor gives a large number of others corroborating it. How much is due to insulation and how much to the expectation of a cure, we cannot tell.

The closing part of Dr. Wagenhols' paper is suggestive, and we quote it:

"One of the patients makes mention of the sensation of drowsiness which came over him by the prolonged use of the insulated bed. This I have noticed in several cases, and distinctly observed it in my own. Now the question is, do the effects of this form of treatment, which in comparison with our former modes, is simply marvelous, depend upon expectant attention? Is it another specimen of the wonderful power the mind has over the body? It certainly deserves attention, as, in either case, the patient is benefited, and this is the end of all therapeutics.

"I have in my possession several communications from gentlemen of worth and eminence in the profession, who fully corroborate my experience in the particulars set forth; and I am confident that if this subject, which I deem important to the profession as well as to the community, is properly tried and thoroughly investigated, much information will be gained and large beneficial results will be accomplished.

"We live to learn; as we learn we advance in knowledge, our information and attainments expand, and thus our usefulness is made felt in communities in which we reside, and our vigor and energy is undaunted, by reason of the good results we obtain."—*Herald of Health.*

The Evils of Alcohol and Tobacco.—Maria H. Holden, of Waterville, Minn., has this to say on the subject.

Alcohol is carrying down to disgrace, poverty and destruction many of the most talented men in the country. It is carrying toward destruction multitudes of the brave and noble young men in our land. All the crimes on earth do not destroy so many of the human race nor alienate so much property as drunkenness. In the United States 133,000 places are licensed to sell spirituous liquors. In these dram shops 390,000 persons are employed. If we add to these the number employed in distilleries and wholesale liquor-shops we shall have at least 570,000 persons employed in sending their fellow mortals to premature graves. Crime is mostly caused by drunkenness. Criminals are an expense to the United States of $40,000,000 per year.

But alcohol is not doing all this without the aid of its companion, tobacco. Yes, tobacco has utterly ruined thousands of boys. A boy who smokes early and frequently, or in any way uses large quantities of tobacco, is never known to make a man of much energy, and generally lacks ambition and mental power. Therefore we would warn boys who want to be anything in the world to shun tobacco as a most baneful poison.

Don't touch it in any form; it does no good, and a very great deal of harm. You cannot properly be called a gentleman so long as your lips are saturated with a disgusting poison. Would a gentleman poison the air with sickening smoke, or deluge the floor with liquid filthiness? Never. Tobacco enfeebles the mind; it makes a man old and nervous. As it is an intoxicant, it exerts a special influence on the brain, and by weakening the nerves produces excitability.

Young men, you *last*, you *chiefest*, let me implore you whose precious precious it still is to make life long by commencing the performance of its duties early. Where lie your own welfare, your own honor, your own blessedness? Lie they not in that future course of life which is to flow out of your own minds and hearts, and which your own hands are to fashion as the temple is fashioned by the builder?

Remember, boys, you need not expect to enjoy a life of usefulness if you begin by loving the tobacco pipe or whisky bottle.

Excitement and Short Life.—The deadliest foe to man's longevity is an unnatural excitement. Every man is born with a certain stock of vitality, which cannot be increased, but which may be expended rapidly or husbanded, as he deems best. Within certain limits he has his choice, to move fast or slow, to live abstemiously or intensely, to draw his little amount of life over a large space or condense it into a narrow one; but when his stock is exhausted he has no more. He who lives abstemiously, who avoids all stimulants, takes light exercise, never overtasks himself, indulges no exhausting passions, feeds his mind and heart on no exciting material, has no debilitating pleasure, lets nothing ruffle his temper, keeps his "accounts with God and man duly squared up," is sure, barring accidents, to spin out his life to the longest limit which it is possible to attain; while he who intensely feeds on high-seasoned food, whether material or mental, fatigues his body or brain by hard labor, exposes himself to inflammatory disease, seeks continual excitement, gives loose rein to his passions, frets at every trouble, and enjoys little repose, is burning the candle at both ends, and is sure to shorten his days.

Women.

Baby Drunkards.

In his recent lecture on temperance to the ladies of New York, Dr. James Edmunds, of London, made a horrible, and, we suspect, a perfectly truthful statement, respecting the manner in which the teachings and prescriptions of medical men are filling the nations of the earth with imbecilea and drunkards. We fear the statements of Dr. Edmunds are as applicable to many American cities as to London:

A very large majority of the ladies of my own acquaintance on the other side, who are a fair example, perhaps, of the ladies living in London society, have acquired the habit of using wine, table-beer, stout, and frequently whisky and brandy to a large extent, I think, owing to the mistakes on the part of my own profession in the advice which they have given. The result is that the babies of the present generation are never sober from the earliest period of their existence until they have been weaned. This is a shocking statement for me to make, but I should not be doing my duty here unless I were to make it as broadly and strongly as that. It is a simple fact. The mother's blood, practically, is entirely in common with that of the child. You know perfectly that if a mother takes even an ordinary dose of such medicine as caster oil, it will very often affect the baby more than it affects the mother; that one has to be exceedingly careful in prescribing for mothers simply on that ground. Now, what does that simple fact, with which all you mothers are familiar, show? Why, it shows this: that the soothed condition of the baby after the mother has taken half a pint of beer, is really the first stage of drunkenness in that child. When I hear a mother telling me that whenever she takes a little whisky and water or brandy and water, because the child is fractious, and she finds that her milk agrees with it better, I am obliged to ask her if she knows what she is doing—if she knows that she is simply making herself the medium for distilling into her babe's system almost the whole of that spirit which she takes into her own, and whether she is aware that that soothed condition of the child is really the first stage of drunkenness. The fact is, the baby is only the infinitely more sensitive extension of the mother's system; and it is more likely than any other part of the mother's system to receive the things that are injurious that are taken through the medium of the mother's diet. Well, now, ladies, bear that in mind when you are told to take wine, or beer, or brandy; understand that you are merely distilling that wine, spirit and beer into your child's frame; that the very mould which that child is to preserve for the rest of its life is being constructed out of blood that is alcoholized—out of a condition of the system in which intoxication is the real substantial element for the first twelve months of its growth. I ask those of you who may have thought it your duty to recommend young women who do not know better than to take those things, whether that is not a grave and important fact for you to think of? And who is there among us whose duty is less than that of a woman? It is said that the man is the head of the household; but all women who are worth anything practically, stand at the helm and guide their husbands by a silent influence which always asserts its sway, if she is a wise and good woman. Look at the influence which a woman can exert over her husband, who is often weaker than herself in those matters, for he has to come in contact with men of the grossest and lowest natures in trade and out in the world. Just ask yourselves if it is not the duty of women always to refine and ethereal-ize man, and she does so if she be a good, true and noble woman. Look, again, at the influence which woman is to have upon the next generation. Who is it that is to make the next generation? Is it the men? No; it is the women. It is the everyday life of the mother that forms the mind of her son, and that forms the very instincts of her daughter, up from eight, nine, yes, to almost any age, while she has unalloyed influence for the first ten years in framing the constitutions and in moulding the minds of those children, though, perhaps, we do not always realize this truth so fully as we might.—*Science of Health.*

The Gentle Dignity of Woman.—There is in particular, says the *Saturday Review*, that soft dignity which belongs to women who are affectionate by nature and timid by temperament, but who have a reserve of self-respect that defends them against themselves as well as against others. These have a quiet dignity, tempered by much sweetness of speech and manner, that is the lovliest kind of all, and the most subtle as well as the most beautiful. They are like the lady in Comus, and seem to cast the spell of respect on all with whom they are associated. No man, save of the coarsest fibre, and such as only physical strength can control, could be rude to them in word or brutal in deed; for there is something about them very indefinite, but very strong withal, which seems to give them special protection from insolence; and a loving woman of soft manners, whose mind is pure, and who respects herself, is armed with a power that none but the vilest can despise. This is the woman who gets a precise obedience from her servants without exacting it, and whose children do not dream of disputing her wishes; who, though so gentle and affable, stops short of that kind of familiarity which breeds contempt, and with whom no one takes a liberty. For this, one can scarcely give a reason. She would not romp or rave if she were displeased, she would not scold, she would not strike; but there is a certain quality in which we may not be able to familiarize, yet which would make us ashamed to pass beyond the boundaries of the strictest respect, and which restrains others less critical than ourselves as certainly as fear.

Woman's Spending Money.—Do men ever consider the business relation which man and wife sustain toward each other? Do they ever look at marriage as a partnership, in which the wife is an equal member, entitled to her just share of the net profits? I know they do not. And yet, the true, loyal wife has her full share of the duties to perform, and sometimes more than her share.

There is nothing which a wife, and more especially a young wife, hates to do more than to ask her husband for money, even though it be but a dollar or two. It is humiliating to be compelled to beg for pin money, or four bits to buy a ribbon for her hair, or a few buttons, or a few yards of muslin. A woman sees many little things in the store which she would like to have, and which would not cost as much as a man's cigars for a single day, but she sighs, and resolves to do without, rather than ask for the money. Perhaps she secretly resolves to take in washing, or sewing, or do some kind of fancy work in order to earn a little money of her own, to do with just as she pleases.

This is not always owing to the man's stinginess, or to his lack of means, but oftener to his forgetfulness and want of care. It is true some women are extravagant, and would spend the money foolishly. But no true wife would go beyond her husband's means, and I may, I think, assert that as a rule, women are more economical than men. If we see a mechanic's wife with a new, fine bonnet, we open our eyes and say what extravagance! But do we consider that probably the man who professes such astonishment smokes that amount away in a week or two, and no remark is made of that? A woman pays three dollars for a pair of shoes, while her husband has a bill in his pocket for a ten dollar pair of boots. A woman pays twenty dollars for a very nice suit, and makes it up herself. Her husband pays thirty or forty for a fine suit, and thinks he got it very cheap. So that after all, a woman can dress well, and yet not spend as much money as a man.

But what I was going to say is, that men should remember the partnership existing, and after the company expenses are paid, call in the other partner and declare a dividend. Give the wife her share of the profits, and I will guarantee that she not only clothes herself and her children in good style, but will lay by something for a rainy day.—*Minnie Carrol.*

The Society of Women.—No society is more profitable, because none more refining and provocative of virtue, than that of refined and sensible woman. Her beauty will win, her gentle voice invite, and the desire of her favor persuade men's sterner souls to leave the path of sinful strife for the ways of pleasantness and peace. But when woman falls from this blest eminence, and sinks the guardian and cherisher of pure and rational enjoyments into the vain coquette and flattered idol of fashion, she is unworthy of an honorable man's admiration.

We honor the chivalrous deference which is paid in our land to woman. It proves that our men know how to respect virtue and pure affection; and that our women are worthy of such respect. Yet woman should be something more than mere woman to win us to their society. To be our companions, they should be fitted to be our friends; to rule our hearts, they should be deserving the approbation of our minds. There are many such, and that there are no more is rather the fault of our own sex than their own; and despite all the unmanly scandals that have been thrown upon them in prose and verse, they would rather share in the rational conversation of men of sense than listen to the silly compliments of fools, and a man dishonors them, as well as disgraces himself, when he seeks their circle for idle pastime, and not for the improvement of his mind and the elevation of his heart.

The fences of the United states are said to be valued at upwards of $1,800,000,000, and it costs every year more than $98,000,000 to keep them in repair.

The qualities that make the ladies and gentlemen are qualities of the soul, and there is no monopoly or exclusive right to these.

FINE MERINOS—FINE POULTRY—ETC.

We have visited the Watkins farm, Santa Clara, to look at the fine sheep which our readers will notice advertised in this issue. Mr. Watkins is better known as a fruit-raiser than a fine stock man, having for many years been engaged is growing a fine orchard and vineyard and producing excellent fruit. His farm adjoins the large and noted Gould orchard, and also the fine park belonging to Mr. Pierce, which everyone who has visited Santa Clara will be likely to remember.

There are few finer places in the State than Mr. Watkins' farm, and probably no better sheep than the thoroughbred Merinos he is breeding. We examined the fleeces of many of his rams, and finer wool cannot be found. The sheep are all remarkably fine, healthy, strong and lively, but docile and good natured. It is wonderful how select breeding will cover the entire limbs and body with superior wool. Some of these sheep have heavy wool from the very tips of the feet to the ends of their noses. The pastures and yards and sheds are all conveniently and well arranged for the business of breeding sheep, and Mr. W. we found to be an enthusiast in his favorite employment. The prices of breeding rams range from $30 to $60 each; ewes about the same price. The pedigrees of these sheep are excellent, as can be seen by the statement made in the advertisement.

We are pleased to observe a growing interest manifested by our farmers generally in all sorts of fine stock. But as much as we were entertained by Mr. W. and with his magnificent herds, he could not monopolize our entire attention while Mrs. W. was anxious to have us take a look at her

FANCY FOWLS.

As we walked with her from yard to yard and noticed how much interested she was in the chickens, old and young, how well she understood their natures and wants, and how kind and almost motherly she was to her pets, we wished that those persons who know this lady-like woman only as a leading "woman's righter," and who imagine her to be "unsexed," as the term is usually applied, could but observe her at home, that they might form a truer estimation of her womanly character and disposition. It is not for us to criticize or make remarks about any one, but we will say, on general principles, in vindication against common prejudice towards ladies who favor giving the franchise to their sex, that we have almost invariably found them in their domestic relations to be refined, intelligent, and the most womanly of women, with enough of good sense to be able to manage a kitchen, rear a family of children, and make home attractive outside and in.

Mrs. W. has silver spangled Hamburgs, the prettiest chicks to our notion in the world, and hardy breeders and good layers. Also White Leghorns and Brown Leghorns, said to be the best layers in the world. They are active birds, and do best where they can have a wide range. Two Leghorn hens, by themselves, have laid since February 12 to May 21 eight dozen and ten eggs, or about an egg a day on the average. This breed is non-sitting. They will cluck a few days after laying a litter, but do not offer to sit, and soon commence laying again. Two Brahma hens, in the same time laid five dozen and eight eggs, or only about five-eighths as many as the Leghorns. Here we saw the smallest Bantams that we ever noticed. They are good layers, producing eggs about half the size of common hen's eggs. They are a very pretty fancy fowl, and stand upon their belligerent dignity till other fowls let them alone. We will not forget to mention the Aylesbury ducks, pure white, which are remarkable for laying and growing. They will average one egg a day eight months in the year, with plentiful feeding. The young get their growth in four months. Mrs. Watkins believes in and practices full feeding for all her fowls, keeps the yards, roosts and coops clean, gives clean water, and keeps the choicest birds of each sort separate for eggs for pure breeding. The rest are allowed to run together and the eggs are sold as ordinary market eggs. Her prices for the finest fowls are $10 a pair.

Mrs. W. keeps a record of all eggs laid, and expenses as well as income, and thinks that she can demonstrate that it pays to keep good fowls and to keep them well.

ECLIPSE WIND-MILL.

Several of these mills have been erected in San Jose, and are proving to be just the thing. They are probably as perfect self-regulators as were ever invented, and have stood the test for many years. Mr. I. A. Hatch, the agent here, has engaged a good many mills. We went with him out to Mr. G. W. Tarleton's orchard to see a fine mill erected on his place. It was doing splendid work, and Mr. Tarleton, who is himself a natural mechanic and knows what is and what is not practical, is much pleased with it, and requested us to recommend this as the very best self-regulator made. Mr. Chas. P. Hoag, Nos. 18 and 20 Fremont street, San Francisco, is the general agent for this State, and Mr. Hatch, of San Jose, for Santa Clara county. They attend to the erection and fully warrant the mills and their own work. Nearly every farmer needs a good wind-mill, and now this dry season is the time to get a good one.

GOODENOUGH.

There is one institution lately started in San Jose that every one of the farmers and horse owners in this valley should hail with gratification. It is the Goodenough shoeing shop, on Santa Clara street, between First and Second streets, where horses are shod without spoiling the feet—where, in fact, a perfect shoe in every respect is put upon the foot of a horse in a perfect manner. Every horse owner knows that hundreds of good horses are every year nearly ruinsd by careless or ignorant shoers, and that many of the "crack shoers" are more conceited than wise. It is a mercy to a horse to have his feet correctly shod, as it is cruelty aggravated to cramp and ruin his feet by the old, imperfect method. Although called new, the Goodenough method has been thoroughly tested, approved and adopted by every society for the prevention of cruelty to animals that has investigated the subject, also by the United States army, and whoever has once tried shoeing by this method will never again go back to the old way, for it is not only in accordance with the anatomy of the horse's foot and true principle, but in practice has been found to be the best, and the only perfect shoe and system of shoeing ever invented.

GOOD DAIRY STOCK.—Mr. W. A. Z. Edwards of San Jose, who is a lover of fine cattle, has a small herd of choice Jerseys, one fine four-year-old bull and several cows. While speaking on the subject of keeping a good class of milch cows, he had occasion to refer to the notes of his farm book. One item we asked the privilege of copying, in substance, to wit: The amount realized in one year from the sales of butter from seven cows, after supplying the wants of the family, was $634 23, and from the sale of seven calves the same year, $353, making $987 23 as the product of seven cows in one year. Who can beat that?—*Cor. Rural Press.*

PELTON'S
SIX-FOLD
HORSE-POWER.

HAVING MADE NEW ARRANGEMENTS with MR. McKENZIE, I am prepared to supply my Powers to all persons favoring me with their orders. All Powers hereafter manufactured can only be obtained of me or my Agents. In future they will be made under my directions and specifications, and nothing but a prime quality of Machinery Iron will be used in their manufacture.

I have greatly improved the application and bracing of my Levers, which will give them ample strength.

All Powers fully warranted.

Vol. 6. San Jose, Cal., July, 1875. No. 7.

AIDING PARTURITION.

Almost every farmer who owns cows has, on one or more occasions, to render some aid and assistance to them during calving time. Some persons, with mistaken modesty, may regard this as a subject too delicate to be treated on in a newspaper. While we believe in true modesty and propriety, and take pride in allowing nothing in the AGRICULTURIST AND LIVE STOCK JOURNAL but what is both pure and first class in sentiment, we, at the same time, confess that we are not qualmish about speaking upon a subject of importance where the truth should be known, that practice may be according to nature, and result in benefit instead of injury. There is a lamentable degree of ignorance among people generally, upon many important subjects, which must be attributed mainly to a false feeling without comprehensive reasons.

This month (June) we had a case thrust upon us wherein our duty was plain, and aid was necessary to save the life of an animal and to relieve her of severe suffering. We will write up the case and offer such suggestions as we believe will be of value to whoever has to undertake a similar act of charity or duty.

The cow was quite old and not very strong, although, having been kept on good pasture, was in fair condition of flesh. She was not expected to have a calf soon, and strayed away and was out of the herd some twenty-four hours before her absence caused alarm. When found, she was lying in the dry bed of a creek, and so exhausted from severe protracted labor that she was unable to raise upon her hind feet. She could, and did, frequently try to arise, and would shift from lying upon one side to the other. The nose and fore feet of the calf only was in sight. The circulation of blood through the placenta from the mother to the fœtus had ceased, and as the connection was broken the calf died from suffocation, its tongue protruding from its mouth. The paroxysms of labor were fearful, and called out every feeling of sympathy. Her strength was being rapidly exhausted, and so weak was she that nature, unaided, was unavailing. Immediate assistance was imperative. What to do was the all-important question. Pulling off the coat and rolling up the sleeves took but a moment. And grasping the projecting feet and pulling with full force *when the cow strained, and easing up the moment* she let go her breath for a rest, was what we did, and just the best possible thing to do.

Here is an important point to be borne in mind, and we particularly request every reader to remember it: Never pull excepting to aid labor; always slack up the moment the muscles of the mother relax. The powerful abdominal muscles are all exercised at every throe or pain, and not a muscle in the whole body but what becomes rigid in sympathy to assist. Then after a moment of terrific effort the muscles must again relax to regain force through rest for another effort. One, without knowing any better, would most likely keep up a steady pulling strain, irrespective of nature's efforts. Here is where the great danger is. Many cows are ruined by such mal-practice. The muscles are over-strained without power to relax, and there is much danger of serious ruptures unless the assisting strain is relaxed whenever the labor relaxes. The common opinion that it is dangerous to assist a cow during parturition arises from the want of understanding on this point, and from a constant strain instead of a surging, not jerking pull to aid nature in her efforts.

In this case, our unaided strength was only sufficient to bring the calf's shoulders in sight. We were alone, and a long distance from help; so we went to the house, got a bucket of water, a halter rope, and a strong stake, six feet long, with one end pointed. The water was for the cow to drink, which she did most gratefully. The rope we slipped over the calf's head, and making a loop in the other end slipped it over the stake. By sticking the stake into the ground for a leverage, we could pull as much as three men without it, and with comparative ease. In a few throes the hind feet of the calf were brought in sight. (The hind feet are, or should be, always in the position as when lying down.) We then changed the slip from the neck to the hind feet, and one more throe relieved the cow.

In this case, the cow bore twins, both dead, of course. Our assistance was again needed, but little force, however, was required to finish up the work, the placenta, or cleanings, following the last birth.

While using the stake leverage, we once or twice strained steadily after the throes had relaxed, and observed the effect. Pain immediately followed pain, and great distress and exhaustion to the cow was at once apparent. Again we say, bear in mind that it is dangerous and wrong to strain steadily. Only act in conjunction with natural labor. Also, please remember to attach a rope to the hind legs of the calf as soon as it can be done, as this is the easiest way to accomplish the work.

The after treatment was bran mash, one quart of bran to a bucketful of water, and all she would drink. As the weather was hot, and the cow lay in the sun, we did not try to give it very warm; simply scalded the bran first, then poured in water cold. After a while we carried a sack of hay, and at night, by coaxing her along with a wisp of hay, enticed her to the stable, where she can have the rest she most needs in comfort.

We cannot conclude this article without giving credit where credit is due, viz.: to our good wife, who has had the advantage of a medical course of education, and understands practically a good deal about obstetrical cases. Her advice was solicited, and our success in this case largely depended upon it, as does the information we have been prompted to give above.

TO OUR FRIENDS.

The first half of Volume 6 of the CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL, is now issued. The Publishers, who are working faithfully to make just such a journal as is needed on the Pacific Coast, and who expect soon to make greater improvements in its appearance, send greeting to all friends, and ask each one to use his or her endeavor to increase its subscription list, by getting one or more new subscribers.

As an inducement, we will commence *new subscriptions* for 1876 NOW, or at any time between now and January, which will allow several copies over a year as a *direct premium* to new subscribers who pay $1.50 in advance.

Show numbers of the CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL to your neighbors and friends, and *if you believe it*, tell them it is just the paper that they want and should have; adapted to our California climate and culture, cheap, in convenient form for reading and preservation, practical, reliable, instructive, social, progressive, pure in moral tone, and really entertaining.

No more generous offer was ever made by any journal to new subscribers. We have been often reassured that there are many thousands of persons on this coast who would not consent to do without the AGRICULTURIST if they once subscribed. "Do by others as you would be done by," is the rule. Advise as you would be advised, and we will be grateful for every favor and endeavor to be true to our obligations.

FIRE INSURANCE.

Mr. J. A. Clayton, real estate agent, has been appointed agent for several first-class insurance companies. He is well-known in this county as a business man, and we advise any of our readers who contemplate insuring to call and see him at his new office, 290 Santa Clara street, in the Farmers' Gold Bank building.

George B. Harmon, lately from the East, has bought out the grocery business of C. A. Hough, who retires, as see per advertisement on first page. Mr. Holloway, who started the store, has now a position on the S. F. *Post*.

The Missouri *Democrat* states that a farmer mer in Johnson county, Kansas, caught 24 bushels of grasshoppers in two days upon his farm.

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, render this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Save the straw and chaff, stack or cover it in a safe place. It will be needed after the first fall rains destroy the dry feed. If you have no stock of your own, you can make money by saving the straw this season. And so long as it will be needed, it is wicked to burn it, as has too long been the custom.

The young man who inquires what sort of trade he can learn, or business he can go into, where he will not meet with enough competition to discourage him, is advised to learn how to practice strict honesty and integrity through life in every respect. He won't be likely to find enough *competition* among mankind generally to hurt him or discourage him in this practice very much.

The fruit crop is short this season. Our principle orchards will not produce over half to two-thirds of a crop on an average. The severe spring frosts caused many apples and pears to fall before they were half-grown, by injuring the fruit in blossom. All kinds of fruit have commanded higher prices than for several years before. The prices in the markets are so high as to debar poor people from purchasing.

The San Jose fruit-canning factory (Dawson & Co.) seems to be doing a large business. They were employing some 135 persons putting up apricots the day we visited the factory. Their fruit costs them on an average about twice what it did last year. But they have established a reputation that demands all they can put up—and, we are glad to say, have done so by deserving it. The Alden factory will probably not do much, as there will be but little fruit to dry.

This month has added another new correspondent to the Household and Domestic columns of our journal. We wish the farmers would take as much interest in other departments as the wives and daughters do in theirs—or at least were as good at corresponding. But we are glad the ladies are bound to have a good paper, and we are determined to encourage them, for the best part of every farm is, or should be, in and about the house.

The late rain did more injury to the dry feed in stubble fields and pastures than to grain and hay. The dry feed in our climate is of as much importance as are the green pastures of the Atlantic States. Grass dried up very early this season, and the two days' rain dissolved away much of the gum and and sugar, the soluble portion of the feed, but it did not rot the feed as badly as a long continued rain would have done. Another rain would set the stock to hunting for something to eat.

And now politics run high. The popular and reform ideas of the people find expression through "platforms." Whether politicians will continue to delude the people, as they have always done, by reiterating the demand for reform; or whether the people, as they should do, will throw politicians overboard, and vote only for modest, good and pure men, irrespective of party, remains to be seen. You have the tables spread before you, and can swallow the whole bills of fare or take your choice of the dishes. It is your own stomach, not our, that you must consult.

An Act Concerning Roads and Highways in Santa Clara County—a 19-page pamphlet—contains much that will be found interesting to the public. It can be found on our table by those wishing to see it. We quote the following:

No stock of any kind whatever shall be allowed to pasture upon any highway.

Any person or persons who shall wilfully cut down or injure any living tree planted or preserved as a shade or ornamental tree, either in or upon the border of any public road, shall be guilty of malicious mischief.

Persons causing water to flow upon or impair any public highway shall be guilty of a misdemeanor.

A road not worked or used for a period of five years ceases to be a highway.

Colt-Breaking. — During the last two months we have been stopping on a farm some five miles from town, and have had occasion to break four different horses to the saddle—the last one a wild colt. It is a little risky, unless one takes every advantage of the horse, instead of being taken advantage of by him. The nature of the horse we have made a practical study for many years. If only one side of a horse is trained, he will be as wild on the other side as though he never knew training. If you gentle three of his legs and neglect the other one, don't take hold of the uneducated leg too confidently. Every motion, every word that you wish the horse to know or be familiar with, must be repeated, gently, but firmly. Get the horses confidence first, then keep his confidence with kindness and consistent treatment; and remember that the horse knows just what he learns, good or bad, and no more, and he remembers every trick, good or bad, also, that he ever learns. It is easier to educate a green colt than to break an old horse of bad faults.

It is said that bad luck runs in streaks. It does look like it sometimes. We have known several cases where misfortune followed misfortune, which the recipients thereof could in no way foresee or avoid. We do not regard such things as always sent for punishment, but are willing to accept the theory that even evils can be made to subserve a good end if we do not succumb to them, but with a high faith in the power of right, put forth energy of goodness to triumph. The soul's growth in weathering great trials is better than riches, more lasting than friendship, and as eternal as life eternal itself.

A WORD TO OUR YOUNG FOLKS.

A happy greeting to all. We wish to become better acquainted with you, and to enable you to form an acquaintance with each other through these columns, in order that you may assist each other in attaining an elevated plane of civilization and usefulness. We invite you all to write short aricles for the Boys and Girls Department, and to take a special interest in its success. Tell us where you live, what you are doing, and how you are doing it, in as plain language as you can use. Keep your eyes and ears open. Strive to understand the cause of things. In conversation and writing, select the best words, reject all slang phrases, and strive to learn the true definition of words. There is no study that will aid you more fully in becoming a good talker, speaker or writer. Shun all bad habits and practices, especially drinking intoxicating liquors, the use of tobacco, profane and vulgar language, etc. These things, to say the least, will not elevate and refine either young or old, and in very many instances demoralize and degrade both old and young. "Avoid the appearance of evil," is a safe injunction. Be kind, truthful and courteous at home and at school, and when you enter society you will become useful, beloved and respected by all.

Uncle Ben.

A DESERVING YOUNG MAN.

Our readers will notice that Mr. Gaston has entered into co-partnership with Dr. Menefee, dentist. Several years since, the young man entered Dr. Menefee's office as student and assistant, and it speaks well for him that he has so gained the esteem of his employer. Any young man might be proud of such a connection. Menefee & Gaston have already the confidence of the public as first-class dentists, and are as well prepared to give perfect satisfaction in dental work as any dentists in this State.

A great temperance revival took place lately in the Catholic church of Council Bluffs, Iowa. Many could not gain admittance. In response to the fervent appeal of the priests, over four hundred and fifty signed the pledge, and the work is still going on.—*The Western Weekly.*

Poetry.

Don't Leave the Farm.

COME, boys I have something to tell you,
Come near, I would whisper it low;
You are thinking of leaving the homestead,
Don't be in a hurry to go.
The city has many attractions,
But think of the vices and sins!
When once in the vortex of fashion,
How soon the course downward begins.

You talk of the mines of Australia,
They're wealthy in gold, without doubt,
But, ah! there is gold in the farm, boys,
If only you'll shovel it out.
The mercantile life is a hazard,
The goods are first high and then low,
Better risk the old farm a while longer—
Don't be in a hurry to go.

The great, stirring world has inducements,
There is many a busy mart,
But wealth is not made in a day, boys,
Don't be in a hurry to start,
The bankers and brokers are wealthy,
They take in their thousands or so;
Ah! think of the frauds and deceptions—
Don't be in a hurry to go.

The farm is the safest and surest,
The orchards are loaded to-day;
You're free as the air of the mountains,
And monarch of all you survey.
Better stay on the farm a while longer,
Though profits should come rather slow;
Remember you've nothing to risk, boys—
Don't be in a hurry to go!

Cottage Music.

When the cottage door is open, and the air is bright and clear,
Then the sound of children's laughter echoes on the listening ear,
And the fall of little footsteps, pattering on the rustic floor,
Gently lures the tired wookman to his peaceful home once more.

Oh, the music of young voices! oh, the tuneful little feet!
How they rise and fall together, keeping time in cadence sweet;
Like the ever-moving planets that make harmony above,
So the happy notes of childhood vibrate on the chords of love.

On the settee sits the grandsire, with his eyes so old and dim,
That the little sunny faces seem like fading dreams to him;
But he hears their merry voices, and it almost makes him young,
As he tries to catch the meaning of each little prattling tongue.

Oh, the merry laughing voices, how melodiously they flow,
Bringing to the old man's memory happy days of long ago,
When he, too, could shout with gladness, when he, too, was bright and bold,
Long before his children's children told him how the world grew old.

And the music of young voices, long as this fair earth shall last,
Will re-link the joyous present with the half-forgotten past;
And the ring of little footsteps, pattering on the cottage floor,
Will be heard the wide world over, till there shall be time no more.

—[Christian Weekly.

The World is What We Make It.

I've seen some people in this life
Who always are repining,
Who never, never yet could see
The storm-cloud's silver lining.
There always something is amiss,
From sunrise to its setting;
That God's hand made their map of life,
They seem the while forgetting.

And I have seen a blessed sight
To sin-beclouded vision,
Some people who, where'er they be,
Make earth seem an Elysium.
They always see the brightest side—
The direful shadows never—
And keep the flowers of hope in bloom
Within their hearts forever.

The one can make the sunniest day
Seem wondrous sad and dreary;
The other smiles the clouds away
And makes a dark day cheery.
This life of ours is, after all,
About as we shall make it.
If we can banish grief and care,
Let's haste to undertake it.

Life's Lessons.

BY SOPHIA ANDREWS.

The laughing hours of childhood
Too quickly pass away,
Like some bright dream departing,
Which leaves no cheering ray.

No cheering ray within our hearts,
Now filled with anxious cares;
We grieve for life's realities
Come on us unawares.

The young heart, unacquainted
With the dangers of the world,
Goes forth to meet its terrors,
With Hope's fair flag unfurled.

The path which leads to evil
Is tempting, bright and fair;
We do not see the serpent
Who coils in ambush there.

Then bitter disappointment,
With all its withering train,
Has crushed the spirit's brightness—
Twill never be the same.

Then laughing eyes forget to smile
And blooming cheeks grow pale;
Our cherished hopes are all o'erthrown
And fall their own sad tale.

And thus it is with those who live
In this dark world of cares;
Too oft they grasp the cypress wreath
Concealed amid the flowers.

Then let us in life's morning,
When life itself is new;
Be ever watchful, waiting,
With one bright end in view.

Centennial.

BY WM. ROSS WALLACE.

Hurrah! Hurrah!
We love the Law
That gives alone true station;
Since he began,
'Tis work makes man
Companion in creation;
And, O can he
More noble be
Than out 'mid Nature's forces
While God's eyes see
His harmony,
With Seedtime's, Harvest's, courses?

Brothers, hurrah
For love of Law,
And if 't could have more growing,
O, sure it shall—
CENTENNIAL
Is almost on us glowing!
A hundred years
Of Mind's, Arm's, spheres
For millions have been rolling;
Joy! Freedom's Bell,
Exulting swell!
All earth hears thy grand tolling.
Then let us make
With Plow, Hoe, Rake,
This year yield CROWN ovation
Upon our sod
Unto the God
Of Freedom's and Work's Nation.

"Hayseed."

Timothy and millet seed,
Redtop and clover,
Scatter them broadcast,
Sow 'em all over.
Powdered with hayseed,
Brown locks and fair,
Cute little barley straws,
Sticking everywhere,
Hurrah for hayseed!
How it makes them stare.

Timothy and millet seed,
Redtop and clover,
Songs of running brooks,
Lays of the plover,
Odors of hay mows,
Gold of the corn.
Hayseed will rule the world,
Sure as you are born;
Ring the bell for hayseed.
Toot the mellow horn!

Timothy and millet seed,
Redtop and clover,
Grangers everywhere
All the country over;
Hark! to the wild goose
Heralding the spring.
All his song is "Hayseed!"
Hear the arches ring.
Amen, to Hayseed;
Hayseed is king!!

—[Mrs. M. C. Clarke.

Several fruit-dealers in Portland, Me., are sending apples to Europe, receiving twelve dollars a barrel.

Honor to Our Workmen.

Whom shall we call our heroes?
To whom our praises sing?
The pampered child of fortune,
The titled lord or king?
They live by others' labor—
Take all and nothing give;
The noblest type of manhood
Are those who work to live.
Then honor to our workmen,
Our hardy sons of toil—
The heroes of the workshop,
And monarchs of the soil.

Who spans the earth with iron,
And rears the palace dome?
Who creates for the rich man
The comforts of a home?
It is the patient toiler!
All honor to him then;
The true wealth of the nation
Is in her working men.

For many barren ages
Earth hid her treasure deep,
And all her giant forces
Seemed bound as in a sleep;
Then Labor's "anvil chorus"
Broke on the startled air,
And lo! the earth in rapture
Laid all her riches bare.

'Tis toil that over nature
Gives man his proud control,
And purifies and hallows
The temples of his soul.
It scatters foul diseases,
With all the ghastly trains;
Put iron in the muscle,
And crystal in the brain.

The Grand, Almighty Builder,
Who fashioned out the earth,
Hath stamped His seal of honor
On Labor from her birth.
In every angel flower
That blossoms from the sod,
Behold the Master touches—
The handiwork of God!
Then honor to our workmen,
The hardy sons of toil—
The heroes of the workshops
And monarchs of the soil!

Good Farmer James.

If you had known good Farmer James,
Whose life in ways of labor ran,
You would have known of sterling worth—
The virtues of an honest man.

He never traveled far away;
A foreign shore he ne'er had seen,
And all his life was humbly passed
Where his forefathers' lives had been.

His fields were ample for his wish,
And yielded crops, with some to spare
For those whose lives were sorrowful
With sickness, poverty, and care;

For 'twas his pleasure to assist
In every way the worthy poor,
And when the suffering came his way
No bolt was found upon the door.

Yet idleness ne'er found a friend
In Farmer James... Sloth was a vice,
And carelessness and levity
Were wrong and sinful in his eyes.

His was the ever-constant aim
To help his fellows all he could,
And ne'er was he so happy as
When to his neighbors doing good.

His life was simple from the first,
And when it ripened to its close,
And he was laid away, for him
No word but that of praise arose;

For he had left a legacy
Richer than gold and jewels prove—
A legacy of honest worth,
Of noble actions, and of love.

The Joy of Doing Good.

If thou wouldst know the purest joy
That e'er suffused the soul of man,
Or deep within his bosom burned—
Pure, heaven-born joy without alloy—
Go forth where only God can scan
The act; go where His love is spurned,
And where His peace is never known,
And take a fallen brother's hand
In thine, and lead him to the light.
Do this because thy love has grown
More like the Master's, truly grand,
And He whose omnipresent sight
Reaches beyond all mortal ken,
Down to the depths of every heart,
Will see the hidden motives there.
If for His sake ye do it, then
A joy which seems of heaven a part
Shall give thee peace beyond compare.

It is better to be flush in the pocket than in the face.

A MILPITAS FARM.

Who has not heard of Milpitas? We take it for granted that everybody knows all about the place. We took a stroll over that way lately and visited the fine-stock farm of Chas. Clark. Mr. Clark is breeding Short-horn cattle, Berkshire swine, and also has some fine farm horses. A young stud, sired by Ben Franklin, and out of a fine bay mare belonging to Mr. Clark, the pedigree of which we do not remember, is a likely looking animal, will weigh about 1,400 pounds, and is just the sort of stock a farmer needs—not too heavy to be active, and with strength to work as well as a gait to travel on the road. His color is a dappled brown chestnut. The price of service, $20.

Mr. C. has not a poor or ordinary looking cow on his place, while he has some very fine ones. He finds it more profitable to raise good stock, in fact, the best he can get; and to that point he went East last year and, in company with Mr. Emerson, of Mountain View, brought out several head of Short-horns of the Duchess strain of blood. His two-year-old bull, Duke of Manchester, is certainly a beauty, as well as of a first-class pedigree. We give here the pedigree of this bull that all can see for themselves the strain of blood. The price for service of common or graded cows is $10, and for pure-bred Short-horn cows, $20.

DUKE OF MANCHESTER: Red; calved 3d February, 1873; got by Sheriff (29964), [Sheriff is now owned by S. B. Emerson, Mountain View.]
Dam Duchess of York 3d by Morrton Duke, 5225,
— Duchess of York by 11th Duke of Oxford, 1506,
— Eugenie by Grand Turk (12966),
— Duchess of Norfolk by Duke of Norfolk (5952),
— Duchess by 4th Duke of Northumberland (3649),
— Duchess by Red Highflyer (2488),
— Duchess by Sir Charles (5446),
— ——— by Harry Lorrequer (3985),
— ——— by Blacher (84),
— ——— by Magnum Bonum (4322),
— ——— by Styford (103),
— ——— by Son of T. Wetherall's Bull (690).

We will also append pedigrees of his two fine imported cows. It will be noticed that they are nearly related to the bull. The pedigrees run into the same blood as the bull back to where the list of dams ends. Mr. Clark thinks his stock will bear close breeding. He says this is the way to keep families pure, and that the high prices obtained for Duchess cattle never would have been realized had they not been carefully in-bred.

DUCHESS OF YORK 13TH: Red; calved 21st February, 1873; got by Sheriff (29964),
Dam Duchess of York 9th by Knight of Canada [738], 6243,
— Duchess of York 5th by 12th Duke of Northumberland 4744,
— Duchess of York 2d by Stone's Grand Duke of Oxford 4402,
— Duchess of York by 11th Duke of Oxford 1506.

DUCHESS OF YORK 15TH: Roan; calved 5th of May, 1873; got by Sheriff (29964),
Dam Duchess of York 5th by 12th Duke of Northumberland, 4744.

Mr. C. has some or the Col. Younger "thoroughbreds," but always enters them as "grades" at the fairs. They are fine-looking cattle, but not up to the perfection of points which fine-stock breeders demand.

For some years Mr. C. has been breeding Berkshire swine. He has now some good looking sows and pigs, but gives little attention to them, as he says it does not pay to breed fine pigs for sale. Last fall he returned from exhibitions at fairs and at once altered some fine boars, as there appeared to be no demand for such stock at paying prices. But, he says, in a few weeks he had more orders for hogs than he could fill. So much for getting discouraged at a legitimate business.

MR. CLARK'S FARM

is worthy of some notice, as it is a representative of the better class of farms in that section. He has some over a hundred acres. The soil is black, rich adobe. Such soil can be plowed when soaking wet, and when dry will slack and crumble fine in the furrow. There is a good deal of land of this character around the bay. This farm is fenced into several fields, the largest of which contains thirty-three acres. Near the house he has a strawberry patch and family orchard of about five acres. From this, irrigated by an artesian well and horse-power, he receives considerable profit each year, besides family supplies. Too many farmers neglect this portion of home farming. Mr. Clark's

SYSTEM OF FARMING,

as to routine, is somewhat similar to that of Mr. Emerson, which we narrated last winter. He sows a field to grain two years, then cuts two crops of volunteer hay, pastures one or two years, then crops to grain again. Meantime the same fields are used for pasture every season several months, or from the time the hay or grain is taken off until the next crop is put in. Land left to volunteer is not even harrowed. He can plow either deep or shallow and get good crops. He uses all the manure, applying to the surface. He finds that it takes at least two years of constant pasturage to clean foul lands suitable for a crop of grain. He goes over his pastures with a scythe to cut down each year such weeds as the cattle do not destroy to prevent them from scattering seeds.

One of the finest crops of

HAY,

and some of the best that we have seen, is now stacked on Mr. Clark's farm. From less than thirty acres there are one hundred tons of fine hay, cut in season and stacked before the late rain. Mr. C. gave us his manner of curing hay. He cuts before over ripe, and lets it lie in swarth in one or two days' sun, preferably one, then he cocks it up and lets stand ten or twelve days to cure, then puts into stacks thirty feet wide, and in about ten days it commences to "sweat," and at the end of eighteen or twenty days, or longer, it is ready to bale. We examined the hay in stack, and found it a nice green color, and must approve of his system of curing for this climate.

His cow-hay was cut quite green. Mr. C. says the cows like it better when cut quite green, and that it is better for them. For horses it needs to be a little riper—more solid, and not so loosening to the bowels.

Whenever we find an old California farmer of experience who follows a system successfully, we like to notice it, and also to give such men as prefer fine stock some credit for their enterprise. We have often advised farmers to either purchase fine bulls or to co-operate in purchasing them. And in this connection we add the advice to patronize persons who do own fine stock when within reach of your own. It pays to get good blood into any herd, and the way to do it is only a question of means and economy.

BRIGG'S SAN JOSE ORCHARD.

The name of Briggs will always be connected with extensive pioneer orcharding in California. George G. Briggs was, from 1855 for several years, the principal orchardist in California. Although his several old orchards near Marysville were long ago disposed of to his brothers and others, he is still in the business in several localities. One of the brothers, J. W. Briggs, himself an old Californian and experienced orchardist, has just started a large orchard of 120 acres in our valley, about half way between San Jose and Alviso, on the west bank of the Coyote. We lately visited the place. The soil he has selected is a deep, light loam, easily worked, and watered by three artesian wells that will flow water enough to irrigate the whole easily, and more too. The locality and the soil we believe to be very excellent indeed for the purpose, in fact, as good as there is in our valley, and we must give the gentleman credit for wisdom in making the choice. The land cost him $200 per acre, and under Mr. Brigg's hand it will not be long increasing in value three fold.

We felt interested in finding out the kinds and varieties of fruits that Mr. Briggs thought most profitable to cultivate. The principal portion he has planted with the design of

GROWING FRUIT TO SHIP EAST.

He has set a large pear orchard. The varieties are Bartlett, Buerre Hardy, Buerre Clairgeau, and Winter Nellis. These varieties have been proved the best for profitable shipping East, and are standard varieties everywhere. Mr. B. is too practical an orchardist to cultivate many different varieties. In his large plum and prune orchard, the prunes are made almost a specialty. This part of the orchard is not yet completed. The Gross and Petit prunes De Agen and the Fellenburg are the leading sorts. A thousand cherry trees, mostly Black Tartarians, will about complete the list of trees.

In a portion of the orchard a fine plantation of strawberries is started. These will do as well in the orchard as out until the trees are full grown, and even then they will yield well with proper care. On such light soil, irrigation will not be likely to injure the trees as it would in flat, heavy soil. We noticed that there is quite a fall from the upper to the lower side of the orchard. This will facilitate drainage, and the roots of the trees will run deeply into such soil even when plentifully irrigated on the surface.

While the trees are young, crops of vegetables will be grown. With plenty of water on such soil large crops can be grown as well as not. The trees will not be injured, and the soil can be made pay for cultivation handsomely. We saw in cultivation onions, beets, carrots, squashes, potatoes, etc., between the rows of trees. We remember when Mr. Briggs, at Marysville, cultivated water-melons in his orchard before the trees were large enough to bear much, and many thousand dollars' worth did he sell to the "lousy miners" in early times. Brigg's melon patch was as noted as was his famous peach orchard a few years later. By the way, it was something of an accident, as well as good luck, was

that peach orchard. A large lot of Chili dried peaches arrived in Marysville in an unsalable condition. They had been dried pits and all. Mr. Briggs bought the whole lot "for a song," and planted them. After that, when he found that many of the seeds grew, he sent East for scions and young trees of best varieties, and soon had a fine orchard as the result of forethought and sagacity—for in those days it was looked upon as a desperate experiment and undertaking to try to raise fruit in California. But, after all the experimenting and successes in fruit culture for years in this State, it should be a satisfaction to our people to know that San Jose is yet to bring out the finest orchard that the genius of a Briggs has ever conceived. Success to the crowning point.

HORTICULTURISTS, ATTENTION.

The American Pomological Society will hold its fifteenth biennial session in the city of Chicago, September 8, 9 and 10, 1875. The Society will hold its meeting for discussions.

Under the auspices of the Illinois State Horticultural Society, there will also be held, in the Inter-State Industrial Exposition building, a national exhibition of the fruits and other horticultural products of North America. Seven thousand square feet of space in the south end of the main floor and gallery of the great Exposition building will be assigned to the various States, Territories and Provinces; and in the space assigned to each State, Territory or Province will be arranged the State, county, society or individual collections contributed therefrom, from Nova Scotia to California, and from Key West to Oregon.

Upon the same day, and in the same building, the great Inter-State Exposition of the Arts and Industries will begin its four weeks' exhibition. In immediate proximity is the floral and plant department of the exposition.

The Wilder medal of the American Pomological Society will be awarded for meritorious objects.

It is anticipated that hundreds of thousands of people will visit this grand show of fruits in connection with the great exposition.

As the exposition will continue four weeks, it is desirable that the collections should remain; and the Executive Board of the Illinois State Horticultural Society, who have charge of the fruits, will have a committee in attendance during the entire time to see that all collections are kept in good order—decaying fruits removed and their places filled with similar ones, as far as can be done.

Correspondence relating to the exhibition should be addressed to O. B. Galusha, the secretary of the State Society, at Normal, McLean county, Illinois. Packages of fruits, with the names of contributors, may be addressed as follows: American Pomological Society, care O. B. Galusha, Chicago, Illinois. Shipments should be made in time for arrival by the 6th of September.

We hope each of our horticultural readers will try to represent California by sending specimens of fruits, etc., as they may think most worthy of attention. California should be well represented.

A tea set—the Chinese.

WINTER IRRIGATION, OR FLOODING.

There is not a farmer of extensive experience in California but what will admit that if the large majority of our dry soils were once thoroughly saturated in winter by flooding with water, they would produce good crops of grain with the addition of what rain falls during our driest seasons. There is no question about the practicability of filling the soil with water where it can be obtained without great cost. We know that in many localities water is allowed to run to waste that could be cheaply turned in ditches upon and led over the farms. The same farms would not now sell for one half they would bring if crops were made sure in dry seasons, and with a system of winter irrigation these same farms could be made to yield three times what they now do on an average.

We have written a good deal upon this very subject first and last, but find it necessary to continually harp upon whatever subject is not popular enough to be generally adopted. We are satisfied that were a general system of irrigation once appreciated in California, it would nearly double the productive capacity of our State, and be worth untold millions to our people. Why our farmers do not combine more generally and utilize the valuable water that is now allowed to run to waste, can only be because of a stupidity hardly pardonable. There ought to be a "revival" in farming matters, a grand waking up and taking hold of the right end of things in this State, something better than the lazy method inherited from the slothful ranchers of the early days.

FENCING THE FARM.

We believe in the justice of the no-fence law—that is, in a law that does not compel a farmer to fence his land against another person's stock. But, at the same time, we believe that every good farmer should have his farm well fenced into fields convenient for rotating crops and keeping stock. Aside from the orchard and garden, which should always be fenced against all stock, every field may at some time during the season be used as a pasture. Hay and grain stubble fields make excellent pastures in our drying climate until fall rains, or until they are cleaned by stock.

Herding stock is time wasted; or, at any rate, we would sooner put in our time building fence than racing stock right and left out of a grain field into an adjoining stubble or range. Besides being bad for the stock, it is terribly trying to the patience to do it. Cows in particular are liable to be injured by herding. They should be kept perfectly tranquil and quiet to get the best yield of milk and to be kind of disposition. Many farmers miss it by not having cross fences, so as to utilize their feed when it is most needed.

It looks bad to see a dog preceding his master down street, and calmly turn into the first saloon he approaches. It shows there is something wrong, something lacking, a deplorable tendency on the part of the dog.

The farmer who has established his reputation for having the best marketable products, will always command an extra price for all his crops.

NEWS ABOUT NEWS PAPERS.

Geo. P. Rowell & Co's American Newspaper Directory: containing accurate lists of all the newspapers and periodicals published in the United States and Territories and the Dominion of Canada. New York: Geo. P. Rowell & Co., publishers.

This is a book of nearly a thousand pages, published in the interests, and especially for newspapers and advertisers. We find it a valuable book of reference. From the preface we subjoin the following interesting information:

The seventh (1875) edition of the American Newspaper Directory contains the description of 774 daily, 100 tri-weekly, 121 semi-weekly, 6,287 weekly, 27 bi-weekly, 108 semi-monthly, 850 monthly, 10 bi-monthly, and 71 quarterly publications; a total of 8,348, being an increase 564 over last year, 1,057 over 1873, 1,426 over 1872, and 1,910 over the edition for 1871.

An unusual number of newspapers have been reduced in size, changed proprietorship, or suspended publication during the year just past, indicating that it has not been one of prosperity, notwithstanding the fact that the actual increase in the number printed has exceeded any previous year since the establishment of the Directory.

Circulations have materially decreased. With the exception of two Sunday-school papers, no periodical issued west of New York City sustains a claim to a regular issue of 40,000 copies.

The number of newspapers commencing publication during the year just passed has averaged within a fraction of six each working-day, but owing to suspensions and consolidations the actual increase has been less than one-third of the number established.

California has one less paper than last year.

Number of papers published in this State: Daily, 24; tri-weekly, 2; semi-weekly, or weekly, 82; bi-weekly, 1; monthly, 24; total, 211. The book contains a list of 123 agricultural papers; California has six, and Oregon one.

YOUNG STOCK WITH COWS.

Calves and yearlings that have not been so thoroughly weaned as to forget the cows should never be allowed to run in pasture amongst them. We have lately had a little experience in this matter. Some young stock were turned amongst cows that we are milking, and among them happened to be some yearlings belonging to the cows. Although the cows had young calves, they recognized their own, and by licking and mooing about them got the animals to sucking. As soon as we found it out the young stock were removed, but the cows held up their milk, disliked to be milked, and acted mean in every way. Before the young cattle had access to them they were models of kindness and content. The result is, they persist in bad behavior, and the milk has depreciated in quantity and quality, although they have good feed and treatment.

Worms in Orchards.—We notice that there are some Western orchardists who sprinkle the trees with water poisoned with Paris Green. They say one good sprinkling with Paris Green water cleans the worms out completely. A good garden syringe or a watering pump will throw water over the highest apple tree. They use a tablespoonful of Paris Green to a bucketful of water.—*Ex.*

The average condition of the grain crop is very pertinently expressed by a subscriber at Sunol Glen. What is true in his locality will very generally apply all over the State. He says: "In regard to the grain crop here this most peculiar year, it is spotted. Early-sown grain is good; medium early, about half a crop; while late-sown is almost an entire failure. The June rain-storm did some damage to hay, and crinkled the standing grain. Take it all in all, it has been quite an eventful season. The weather all through has surprised the oldest inhabitant." This is even so. The winter opened early with warm rains that made grass and grain grow promisingly; later came a season of unparalelled severe frosts, with dry winds, that were discouraging; then a very promising supply of rains, followed by a dry spring and absence of May showers. Finally, in June, springs up a regular *south wind rain-storm* of two days' duration—something never before known by the oldest inhabitant of California in summer. Showers would not surprise anybody, but such a storm is a puzzler to the weather-wise. What will follow next we are curious to see. One prophet, who believes that civilization affects the weather, attributes the changes to the rush of Eastern people to California—"they are bringing their weather with them"—smuggling it overland without paying freight, we suppose. The matter should be investigated.

Another Cure for Hoove or Bloat Cattle.

Mr. John B. Warren, of Petaluma, says the *Stockton Leader*, has given information which will be of much importance to stock-raisers. He states that bloat in cattle, caused by eating green clover or from similar causes, may be cured in the following manner: Take hold of the animal by the horns and raise its head as high as possible, then open its mouth, take hold of its tongue with one or both hands and pull it out as far as it will come. As soon as this is done the gas will begin to escape through the valves that will thus be opened at the root of the tongue, and if the mouth is kept open and the tongue pulled forward for a few minutes, the cure will be complete.

Mr. Warren has seen this course pursued in several cases with cattle, also with horses suffering from wind colic, and in every case it proved a complete remedy. When the gas begins to escape it will ooze through the opening like the air from a punctured bladder. This remedy is easily applied, is safer and less painful to the animal than the operations that are sometimes resorted to.

The advantages of San Diego are chiefly for stock raising and bee culture, so large a part of its area is mountainous. In bee culture, few countries in the world, if any, rival San Diego county. Along the base of the mountains in their narrow, winding valleys, you see many bee ranches, some with a hundred or more stands of bees. The honey is made entirely from wild flowers, and mostly from the mountain sage. That made in the early spring is as beautifully white and clear, and as richly flavored as any honey can be. I was relisbly informed that in 1874 the county shipped about 400 tons of honey, and would probably ship at least 600 tons this year. It is becoming the chief agricultural interest of the county, although besides mixed stock, some wheat and barley are also successfully raised.—*W. A. J. Wright.*

How much does a fool generally weigh? A simple ton.

Correspondence.

The Great Question of Our Times.

THE following, written by a lady—a farmer's wife, unused to the pen—as a composition to be read before the San Jose Grange, contains much mature thought upon an abstruse subject that reflects great credit upon the mind of woman.]

The increased restlessness of the working classes throughout the civilized world indicates that in the not distant future some steps will be taken to bridge over the vast chasm which separates the interests and conditions of the producing from the non-producing, wealthy classes. The power of wealth to appropriate to itself a large share of the earnings of the industrious poor, and that this power increases in mathematical proportion to its volume, are admitted facts.

It behooves the friends of humanity to inquire whether the great mass of non-capitalists, by a law of nature like gravitation, must always remain the hewers of wood and drawers of water for the few capitalists. God forbid that I should believe it. Rather would I compare it to a fungus growth on the body of civilization that is corrupting but cannot always exist.

If, then, we are to conclude, as I think we must, that the present oppressed condition of non-capitalists is not God's fault, but ours, it follows that reform is possible; but to accomplish this reform is a herculean task. It will meet with the hostility of the favored class, who control two of the essential sinews of war—money and generalship. It will be clogged by the ignorance and impracticability of the lower strata, and hindered by the Bourbonism of the middling and well-to-do, who are ever ready to take up and reiterate the cry of "communism" to every measure that looks toward social reform.

The recognized theoretic duty of governments, to

STRENOTHEN THE WEAK AND RESTRAIN THE STRONG,

is being reversed in practice; and, instead, every department of the government is made to do duty in the interest of capital, at the expense of the commonwealth, and in violation of the rights and interests of non-capitalists. The government shirks its equal share of the public burden, corrupts public officials and demoralizes society by setting up money, instead of moral worth, as a standard of respectability. But, to enumerate half of the sins of the vast accumulations of capital would be too tedious. I will only say that under our government and laws such a condition of affairs is incompatible with the general good which should be paramount in all governments.

The question above all others which demands our most serious and careful consideration is, how we may place wealth (which we must recollect is made by its possessors only a little less than omnipotent,) under the control of law so that it will be a

SERVITOR OF THE PUBLIC GOOD,

instead of reaping where it hath not sown.

Many good thinkers have reluctantly come to the conclusion that human nature is too weak, and human integrity too frail to resist the temptations which large capitalists are able to offer, and they propose to get rid of the serpent by destroying the egg. To that end they would diminish the facilities for acquiring great fortunes which would cause a more general diffusion of wealth, and more nearly equalize the material comforts and conditions of the people.

The means by which this object may be accomplished are various, but the one which deserves the first consideration is, to so clog with disabilities their ownership of *the earth* (without the use of which human existence would be impossible) as to make it an unprofitable speculative investment for capital.

GRADUATED TAXATION

upon all quantities of real estate above a reasonable limit, offers the means of introducing this reform with little or no violence to private rights; but details will not be expected in this paper. Thus it will be seen that the capital now used in the monopoly and speculation in real estate would seek investment in interest-paying bonds, thus reducing the rate of interest and the facilities of acquiring great fortunes, stimulating manufactories and contributing in various ways to the public good.

But, as before intimated, any proposition to switch off the old narrow track will meet the opposition of money-bags, Bourbon and ignorance, and as reforms are of slow growth, we must, in the meantime, use such tools as are within our reach, so that we may, in a measure, at least, bridge over the gulf that divides productive labor and capital. And in the selection of tools we must not overlook

CO-OPERATION.

The judicious combination of small capitals, under wise and careful management, would accomplish many enterprises of which, otherwise, capitalists would have a monopoly. For this purpose our Grange organization is admirably adapted. We have a bond of sympathy—a common interest. We form social attachments, make acquaintance, and encourage the growth of confidence, which is indispensible in all co-operative enterprises. We can, and will co-operate in the selection of rulers of the state and nation who will understand that there are rights and interests other than those of capital which they are bound to respect, and we will inform ourselves of these rights by the free interchange of opinions in the Grange. In short, the Grange has already borne much good fruit, and is full of promise for an increasing crop in the future, and I should regard as treason to humanity any attempt to check its growth and perpetuity.

SAN JOSE, June, 1875.

Concrete Walls---Two Methods of Building.

EDS. CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL: In your last issue a correspondent calls for information about concrete walls. In the State of Delaware, fine buildings are made with mortar-brick, which is another name for concrete. They take one bushel of stone lime, and after slacking, add ten bushels of coarse, clean sand, with some gravel, then mold it like brick in sizes to suit. If a twelve-inch wall is to be made, 12x18 inches and 8 inches thick is a convenient size. Spread the brick upon a graded yard covered with sand to dry. When dry, they lay the brick in common lime mortar, and plaster it both inside and out, then stripe and pencil to suit their taste. This makes the finest kind of concrete walls, and, if well done, a substantial and durable building.

In Colorado, they have another method.

Some call it concrete, while others give it the dignified name of "grout." They prepare the mortar same as above. Then place two stiff planks upon the foundation for the wall the distance apart they wish the thickness of the wall. The planks have stays across the upper edges to keep them from spreading, and bolts near the lower edges for the same purpose. The planks should be smooth on the inside, and sufficiently stiff to avoid springing. The mortar is placed between the planks and packed in, and if smooth, washed gravel is packed in with the mortar, to form a face to the wall, it is all the better. The mortar soon sets, when the bolts are withdrawn and the planks moved to another place, and the operation repeated until the wall is finished.

I noticed at Fort Collins, Colorado, a large store building made in this way. It was two stories high, and had a very substantial look, although of rough exterior. It was not plastered, nor did they stop the bolt holes with mortar, and many of the gravel stones on the surface were as large as a man's fist.

Frost does not seem to injure it, yet I doubt if it will prove a practical method of fencing in California.

San José, June, 1875. S. Pelton.

Domestic.

Chats With Farmers' Wives and Daughters---No. 7.

by "Jewell."

Perhaps a few experiences in my farm life would be amusing, and show how wide apart *theory* and *practice* come to us new beginners. Shall I own it? I *can't* make good yeast bread! I've tried it faithfully for over two months now, and only succeeded three times in having eatable, light, sweet bread. I may be stupid at it, but I understand thoroughly the routine to go through—the *theory* is all right—but the *practice*,—ah! there is the rub. I doubt not but that I could take a raw hand and tell them just how to make good bread, and they would succeed, too, after trying as I have, two months—perhaps in less time. I may be too old to learn. Who knows the age past which it is impossible for a woman to learn how to make good bread? When I got brewers' yeast I seldom failed—that was in town. But here on the farm, where bakers' bread would taste strangely out of place, it became a duty—nay, a pride, to have plenty of sweet, fresh bread to spread the new butter upon. So at it I went, earnestly, without doubt of success, when, lo! my sponge would not raise. But I was not to be dictated to in that way. I'd make it into loaves. No, it refused to do more than flatten out. However, with a heavy heart and dull head, I was bound to utilize my labor and flour; so I baked it, and fed it in leaden lumps to Jack, our "hound dog," who took it out of my sight.

My husband (who knows *everything*, as all husbands should) encouraged me, and told me to try salt-rising bread. His sister told him exactly how, and a good recipe was in the May number of the Agriculturist, and it was simple, and if I once got into the way of making it, it would be easy enough, etc. So, next day, I cheerfully started in before breakfast; but things did not work well. I could not get the temperature just right. It first baked on the bottom of my pan, and then when I set it off the kettle of hot water it got too cold. At noon I could see no sign of change in the raising. By two o'clock a little foam on the top encouraged me to make it into a sponge. Then I kept it warm (keeping a fire on purpose all day), and tendered it my utmost attention until supper time, when *it* was made into loaves and set to raise. This it gradually did, in a slow, unwilling way, very exasperating to me, so earnest was I. We sat up and baked it that evening—though I felt guilty in doing it, and really thought myself imposed upon by that heavy leaden, sour-smelling mass—the result of all my pains! But my good husband quite petted me this time, and made me feel that a triumph *must* follow when one was determined to succeed in a good undertaking, and that *we learn through our failings*, not successes. So in my heart I resolved to succeed, and in imagination had mastered the art, and baked my last sour bread.

To my next attempt I resolved to give my undivided attention, and as my husband was at home that day, I called in his experienced (?) eye to see the process, and together we watched it all day. By eight that night our united efforts were crowned with success! The two loaves were fragrant and plump, *complete*, the "guide mon" said; but in my heart I knew it was not quite salt enough and resolved to do better next time. But the next, though salt enough, was heavy again, so I felt more than ever how necessary was *light* to our lives.

To recount all my failures would be but a repetition, and my success also. Now I must say right here that this experience has more than ever persuaded me that *our girls should be encouraged and taught to be good cooks*—to make good bread. It is far easier to learn when in mother's house, with few responsibilities, than in our own, when cares and babies are clinging to us and demanding our ceaseless attention.

How to put up currants.

As seasonable advice, I clip from the *Country Gentleman* the following recipes, which are good. I advise the putting up of currants and all tart fruits in glass always, as tin is likely to corrode to the injury of the flavor of the fruit, and danger of the health also:

Currant Ice.—Take one quart currants, one pint of raspberries, one pint of water, and one and a half pounds of sugar; mash the berries; add them to the water; squeeze out the liquor; add the sugar, and freeze. Where raspberries are unattainable, use more currants and flavor with extract of raspberry or strawberry.

Currant Jelly.—If the fruit is gathered before dead ripe, it will make firmer jelly, and it is not necessary to pick it from the stems, only remove all leaves or sticks. Put the fruit in a pail, or pan, over a kettle of boiling water, and heat enough for the skins to break easily, then dip into a bag made of flannel, and squeeze till dry. Measure the juice, allowing for each pint a pound of white sugar, but do not add the sugar to the liquor until it has been allowed to gently boil over the fire for twenty minutes or more, removing any scum that may arise. The sugar is now to be added in the proportions mentioned, when the process of coagulation is so rapid that lumps of jelly are often formed before it is all dissolved; while in color it glows with all the richness and transparency of the garnet. The secret of making all fruit jellies is to boil the juice before, and but little after adding the sugar; if boiled together, the product is apt to be soft, dark and gummy, if it ever becomes jelly at all. Use a pound of sugar to a pound of fruit in preserving currants, and if all the necessary boiling has taken place before the sugar is added, the juice will become a tender, beautiful jelly.

Currant Catsup.—This is a favorite preparation to eat with meats, and is made of five pounds of mashed currants, three pounds of sugar, one pint of vinegar, two tablespoonfuls of finely-ground cinnamon, one of cloves, one of allspice, one of black pepper, one nutmeg and a pinch of salt. Cook half an hour. A great improvement on the above is to add the same proportion of spices to the juice, boil, and finish as jelly. Then the useless seeds and skins are rejected, and more than all, it always retains its first fresh, delicate flavor, which is lost after a time under the regular recipe for catsup.

Preparing Currants for Winter Uses.—To prepare currants for mince pies and other winter uses, add one pound of sugar to four of fruit picked from the stems; cook a few minutes, spread on plates or tins, and dry in the oven, which must not be hot enough to scorch them. When sufficiently dried away, pack in stone jars, and put a layer of sugar over the top. This method is superior to all others for preserving the flavor of fruit (it even adds to the richness of cherries); no fermentation takes place if stored in a cool place, and it will keep unchanged for years. Heating a little sugar and water with several spoonfuls of the fruit makes a dish of preserves in a few minutes.

Currant Vinegar.—To make ten gallons take six quarts of ripe currant juice; put in a jar and let it remain a day or two, removing the scum; add one gallon of molasses, and water enough to make up the ten gallons of liquor; set it in the sun, or a warm place, being careful to exclude insects, and it will soon become good vinegar.

To the above I will add the following:

Raspberry jelly.

There is no more delicious jelly than raspberry; but as the raspberry is a dear fruit and difficult to prepare alone, we find that by taking one-third raspberries and two-thirds currants the jelly has all the flavor of raspberry, does not cost half so much as clear raspberry, and is every bit as good—we think superior to clear raspberry jelly. Make the same as currant jelly.

Another hint: Every year that we put up fruit for the table, we use more sugar than formerly. The fruit keeps finer with plenty of sugar, and is certainly nicer, and suits almost every one's taste better.

Familiar Talks---No. 1.

by "Snip."

"Jewell," "Nell Van," E. E. Anthony and the rest of you who write for the Agriculturist, how I would like to have a cozy, personal chat with you all. As that is out of the question, the next best thing is to become acquainted through the columns of the paper we all prize so highly. Many a useful recipe and hint have I gleaned from it, and will now offer one or two which I think all my sister housekeepers may not have thought of.

A pan-holder.

Instead of the cup-towel or dish-cloth to remove pans of bread, gem pans and the like from the stove, take a coffee or salt sack (a grain sack will do), cut into pieces about ten or twelve inches wide and long enough to al-

low both ends of the bread pan to be taken hold of; bind or hem these, put a strong loop on one corner of each, and keep one hung near the stove. One who has never used them will be surprised to find now much longer towels and dish-cloths will keep clean.

I wonder why so many house-keepers will take "anything that comes along" for

A DISH-CLOTH.

It may be cleanly, but it does not look so, to see a cloth, the original color of which is unknown, used to clean (?) dishes. It will take but a few minutes to cut a flour sack into convenient sizes and hem them. If you will "gather up the fragments" of time, you can soon have plenty of stove-cloths and nice, white dish-cloths.

Following is a recipe that I think is an improvement on the

OLD-TIME FRITTERS

our grandmothers used to make. Don't condemn the article because it is *fried*. Properly cooked it will not soak the grease, which should be pure lard, and boiling hot at the time of cooking and kept so: One pint of Graham flour, milk enough to make a thick batter, one egg, one half teacup of syrup, a little salt, one dessert spoonful of yeast powder. Fry in lard, one teaspoonful for each tablespoonful of batter.

FRUIT IN TIN CANS.—The Boston *Journal of Chemistry* says: The impression prevails among those who use freely fruit which is put up in tin cans, that they are injured thereby, and this impression is in many instances correct. We have long contended that all preserved fruits and vegetables should be stored in glass and that no metal of any kind should be brought in contact with them. All fruits contain more or less vegetable acids, and others that highly corrosive are often formed by fermentation, and the metallic vessels are considerably acted upon. Tin cans are held together with solder, an alloy into which lead enters largely. This metal is easily corroded by vegetable acids, and poisonous salts are formed. Undoubtedly many persons are greatly injured by eating tomatoes, peaches, etc., which have been placed in tin cans, and we advise our friends who contemplate putting up fruit this summer to use only glass jars for the purpose, or what is still better, is to have a family fruit dryer on hand. Fruit is so nicely dried on this machine as to excel all other dried fruit, and if not superior it is equal to any of the canned fruits.

RECIPE FOR CRYSTALIZING GRASSES.—This is the way I do mine, and always have had success: One pound of alum, pulverize and dissolve in a quart of water, but do not let it boil; pour the solution into a deep earthen jar, and let it stand until about blood warm. Fasten your grasses with strings to a stick laid across the top of the jar, set away in a cool place *where they will not be disturbed* for twelve hours, then take them out and let them drain. For blue crystals use indigo or washing blue; for yellow, boil a few saffron leaves in a little water and mix it with the alum water; for pink or red, use Prussian red —the more you use the brighter the color. The solution may be heated over and used until all the alum is gone. Be sure and have your grasses perfectly dry before putting them in the water. Press some green and autumn leaves to put in your bouquets. Some bittersweet berries (if you can get them) will be quite an addition.—*S. A. Lamb.*

THE bright brass work used upon car ornaments and fixtures is the envy and despair of housekeepers who cannot understand why it should not blacken or tarnish as their household utensils of the same metal do when not constantly polished. For their encouragement, we will inform them that after the brass is polished at the factory it is covered with a thin transparent varnish, such as shellac in alcohol; this protects the surface, otherwise it would tarnish as soon as a brass kettle.

HOW TO COOK OATMEAL.—First, be sure to get new, fresh oatmeal, as if it becomes damp or old it is bitter. Put one quart of water into a tin stew pan, salt sufficient to be palatable; stir in carefully so as not to have it lumpy, three or four handfuls of oatmeal. Put it over the fire and stir continually until it has swollen all it will, using care not to let it burn on the bottom. When it has swollen all it will, add more water, and then put the stew pan into a kettle of hot water and leave it cooking for several hours—the longer the better, as the longer it is cooked the softer and more jelly-like it becomes. Having the stew pan in another kettle of hot water prevents its burning on the bottom, and you are relieved from constant stirring. It is good with milk, syrup or sweetened milk, or even with butter alone.

HOW TO MAKE OIL LAMPS SAFE.—A great many accidents are happening every day from the use of kerosene. I will tell you a method by which they can be, to a great extent, prevented, and I hope you will publish it for the benefit of poor people, who are obliged to buy cheap oils. If the body of the lamp is filled with cotton, such as jewelers use to wrap their articles in, after it is stuffed lightly it will receive one-half the quantity of oil which it would if the cotton were not put in. If any accident happens, the oil cannot spill or flow about; but is, as it were, "sopped up" in the cotton, which burns like a fagot, but all in one place.—*Ex.*

GOOD PASTE.—Paste that will keep unchanged in warm weather may be made in the following manner: Put a teaspoonful of fine alum in two quarts of water, and let it boil. Mix a pint of flower smoothly into a pint of cold water, and stir it into the boiling alum water, continuing the boiling and stirring till the flour is cooked, and the whole is clear, like starch. Add to this about half a teaspoonful of essential oil of cloves or cinnamon, or a little carbolic acid, strain through a wire gause or perforated tin strainer, and bottle in wide-mouthed jars, which should be corked to keep out dust.

CRUSTED APPLE PUDDING.—Pare, core and stew slightly, two quarts of tart mellow apples, and place them in a pudding dish; then, to one and a half pints of wheat meal, add one gill of Zante currants and boiling water enough to make a dough, stirring lightly until mixed; roll it out one-third of an inch thick, and spread over the apples. Bake it in a quick oven forty or fifty minutes, take out, reverse on a hot plate, mash the apples with a spoon, and sweeten, if desired; cut it in pieces like a pie, and serve warm, with some fresh sauce.

A FEW years ago a hungry crowd sat down at the well-spread supper table of a steamer, upon which one of the dishes contained a trout of moderate size. A serious looking individual drew this dish toward him, saying, apologetically, "This is a fast day with me." His next neighbor, an Irish gentleman, immediately inserted his fork into the fish, and transferred it to his own plate, remarking, "Sir, do you suppose nobody has a sowl to be saved but yourself?"

A GOOD way to soften putty or paint, is to mix equal parts of good soap, potash and slacked lime, add water to form a paste, apply with a brush, and let it stand three or four hours, and your putty or paint can be easily removed.

By planting several Limburger cheeses about his potato patch a farmer in Linn county, Iowa, drove off all the potato bugs while his neighbors suffered severely from their ravages. This is that kind of cheese which is said to be ripe when a bit as big as a pea will drive a dog out of a tan-yard.

Sheep and Goats.

Angora Goats.

A PROLIFIC subject to write upon, and a prolific animal to breed from is the Angora goat on the Pacific Coast. The time was when it was thought an experiment to breed these animals as a business for profit, but that time is as much passed as is the experiment of cultivating grain, fruit and other productions of the soil in California. The pure bred goats actually improve in our climate, and the common goat, when bread up to a fifteen-sixteenths Angora cross, will generally produce fine No. 1 fleece, Every year the crosses with pure bucks are getting finer, and the success of the enterprise is more apparent. The uses to which the fleece is put are multiplying as our civilization develops in material science and art, and the skins are more demanded, and the flesh is better appreciated. Consequently the demand must always exceed the supply, while a liberal supply must encourage a positive demand. We remember when it was thought that fruit would soon be worthless, so much of it would be produced. But see how the demand has increased as the art of canning, etc., has developed. So with every other useful production, and so in a more striking manner must it be with the Angora goat and its products. The millions of acres of hill lands that are better adapted to the goat than to to any other animal or product, must be also encouraging to the business here. But we might ramble on upon this subject without end. What ia of more direct, practical value to our readers is

FACTS AND FIGURES.

We are in possession of some of these, through the courtesy of C. P. Bailey, of San Jose, who has in Monterey county a flock of fine graded goats, some of which are now high bred. The figures below show the returns of last year's clip, which was sheared after a late rain and somewhat damaged by matting or felting together. No returns have yet been received from this season's clip. We are promised the figures when received. Here is a correct copy of returns for last year's clip:

SALES TWO BALES MOHAIR, ACCT. MOODY & FARISH.

March 31, 1875:

C. P. R. R. 2 Bales Goat Hair—	
375 lbs 1st quality, @ 70c	$262 50
20 lbs 2d quality, @ 48c	9 60
574 lbs shorts, @ 22½c	129 15
14 lbs waste in sorting.	
44 lbs tan,	
1027 lbs	$401 25

MOODY & FARISH, ACCT. OF ABOVE.

Proceeds in currency, $359 33, @ 116¼, in gold	$307 80
Our Coms., 2½	7 70
Net in gold	$300 10

San Francisco, June 11, 1875.

It will be observed by the above figures that only about one-third of this shearing was of first quality. This, from a graded flock, is nothing to be wondered at. As none but pure bucks are used for breeding, in a few years

more the greatest part of the fleeces will be counted as first quality. Mr. Bailey says that the three-fourths and seven-eighths Angora blood with the common goat will make "shorts" fleeces, a few seven-eighths will make second quality, and the fourth cross, fifteen-sixteenths, will nearly all make first and second quality, while the fifth and above crosses will be counted as first quality fleeces.

Mr. Bailey sells a good many high grades every year, and is not breeding so much to sell the fleece as to meet the demand for the goats themselves.

Mr. Gilmore, of El Dorado, sent his last year's clip to Messrs. Hall & Turner, Jamestown, New York, and got a return of 85 cents for first quality fleece. Mr. Bailey has shipped his this year's clip to Jamestown, and expects a much better price than for last season's clip.

The comparative value of sheep and goats' fleece is worth noticing. Mr. B. assures us that there are now, and have been sold in San Francisco this year, some 6,000,000 lbs of sheep wool, at 10 to 16 cents, costs of freight to be deducted. There are now some 7,000 high grades and pure Angora goats on this coast. The fleeces will average 2½ lbs to the head, or 17,500 lbs of mohair, worth at least 80 cents per pound, or about $2 00 per head annually, on an average, at present low prices.

Some parties are talking of shearing the Angora goats twice a year, as is the custom in this State to shear fine-wool sheep. Mr. Bailey thinks it will be better to shear but once a year, but advises feeding the goats when pasture gets short and poor, and then the fleece will be of a uniform strength and texture, and be long, lustrous and much more valuable than shorter fleeces.

At any rate, the Angora goat will hold its own in our climate, and our best breeders declare that it is constantly improving. The probability is that it is capable of being vastly improved; and, taken from the half-civilized country of its nativity and placed upon our pastures and under the careful breeding of enlightened and enterprising Americans, it will not be many years before we can ship specimens of Angoras back to their native country that will "astonish the natives."

Oregon is proving to be a fine climate for these goats, and her pastures, green longer than ours, may give her even an advantage over California. Mr. Bailey sold 300 goats to go to Oregon last fall, and has reports of the most favorable character from them.

The Sheep of Spain. — The following, translated from *Le Journal d' Agriculture pratique*, seems to imply that the Merino is not so much of a favorite on its "native heath" as in other parts of Europe or the United States. If the Merinos described below are a fair type of the fine-wool flocks of the modern Spaniard, says the *National Live Stock Journal*, they but furnish additional evidence of the indolence and decay of that once enterprising people. The standard of the noble flocks from which the importations, during the early years of this century, were made, was certainly far above that here portrayed, though considerably below what has resulted from the energy and skill of American breeders, as now represented in the distinctive family known as "American Merinos":

The breeds of sheep in the north of Spain form three groups, perfectly distinct, and characterized—first, by form; secondly, and principally, by their fleeces. These three types are designated in their native country under the names of Merino, Churra and Lacha.

First —The Merinos, or fine wools. The Merino race, in Navarre, resembles somewhat the type which is usually found in France and other countries of Europe, under the same name. Small in size, rather pot-bellied, and altogether presenting a sorry appearance, the only valuable feature about them is their wool. This is short, frizzled, fine and knotty. This race has, of late years, lost much of its relative value, even in Spain. Raised principally in Estramadura, New Castile and Soria, it forms the major part of the migratory flocks; nevertheless, this race is now less appreciated in the north than in the west of the peninsula. Increasing slowly, yielding only a medium quality of mutton, they are not even profitable for their wool, which, though exceedingly fine, is too little in quantity to make up for the other inferior qualities; consequently this race is very little noticed in the fairs and other agricultural exhibitions; the highest prizes being given to the other races, which are usually much better represented.

Second.—The Churra race, or curly wools. They are much more numerous in Navarre, and infinitely more esteemed than the preceding race. They are much stronger and taller, wide in the shoulders, and closely built in the hind quarters. The wool is of medium length, curly and rather coarse. They are held in high estimation for the fine quality of their mutton.

Third.—The Lacha breed, or long wool. The distinguishing marks of this breed are medium hight, larger in the hind quarters than the preceding race, a fine head, black sometimes, small horns and frequently without any. This race is particularly remarkable for the great length of its wool, which sometimes measures 30, 35, and even 40 centimetres (12, 14 and 16 inches), hanging frequently to the ground, and giving to the animal a very singular aspect, very much resembling the llama. This curious race lives upon the southern slope of the Pyrennes, to the north of Navarre, and principally in the districts of Irun and Valcarlos. It lives constantly out of doors, night as well as day, either in sunshine or shade, remaining, without inconvenience, exposed for weeks at a time to constant rain, which slips off from their thick fleeces without hurting them in the least. They are never fed, except when the snow covers the ground, and then only a little straw and dry leaves, which serves to sustain them till the snow disappears. Some shepherds, during the lambing season only, place their flocks under shelter. Their mutton is reckoned a little less valuable than that of the Churra race, but is nevertheless of good quality. Their fine fleeces are very valuable, and they supply the greater part used in the fabrication of the famous Valentin cloaks. It is remarkable that this race, to which its long wool gives such a characteristic aspect, although living in the same manner as other races, is not subject to so many diseases, and especially those which so often decimate the other Spanish races.

Integrity.—Who ever possessed it that did not derive untold advantage from it? It is better than riches, it is of more value than "diamonds and all precious stones;" and yet every man may possess it. The poorest may have it, and no power on earth can wrest it from them. Young men, prize integrity of character above all earthly gifts.

Dark ages—The ladies,.

Stock Breeder.

Principles Governing the Transmission of Characteristics by the Sexes.

It has been advanced by some breeders that the male transmitted certain characters mainly relating to the exterior of the animal, while the female transmitted characters relating to the interior. And there are many cases which seem to admit of such a theory. The color of the cock is usually transmitted to his offspring; the ram transmits his peculiarities of horns and fleece, and the bull the presence or absence of horns. These facts, for such they seem to be, can, however, be explained equally well in another way.

If we cross a number of varieties, we find that instead of the offspring always showing a blending of the characters of both parents, in many cases the young animal or plant more nearly resembles the one parent than the other; that is, one parent has transmitted more characters than the other, or has transmitted them with more force.

Thus, when crossing the Short-horn bull upon the native cow, the grade offspring is more of a Short-horn in its characteristics than it is a native. We say, in this case, that the Short-horn bull is prepotent, and to this power of transmission we apply the term prepotency. Now, prepotency may belong to either parent, in fact, it may belong to both parents. The sire may be prepotent, so far as certain characters go, but the dam may be prepotent in other characters. Now, this prepotency tends to give uniformity or fixedness to a race or breed. Darwin makes the observation that in certain families the effect of the prepotency of some ancestor is seen in some distinctive character. He says, "It would appear that in certain families some one ancestor, and after him others in the same family, must have had great power in transmitting their likeness through the male line; for we cannot otherwise understand how the same features should be so often transmitted after marriages with various females, as has been the case with the Austrian emperors, and as formerly occurred in certain Roman families with their mental qualities. The famous bull Favorite is believed to have had a prepotent influence upon the Short-horn race. It has always been observed with English racers that certain mares have generally transmitted their own character, whilst others of equally pure blood have allowed the character of the sire to prevail." Now, this prepotency may come into action independently of any supposed influence of long breeding—so that it cannot be referred to habit, as some would have it. Some of Darwin's examples are interesting and instructive. In chapter fourteen of his work on the variation of animals and plants, he says: "The truth of the principle of prepotency comes out more clearly when certain races are crossed. The improved Short-horn, notwithstanding that the breed is comparatively a modern race, are generally acknowledged to possess great power in impressing their likeness on all other breeds, and it is chiefly in consequence of this power that they are so highly valued. Godine has given a curious case of a goat-like breed of sheep from Cape of Good Hope, a ram from which produced offspring hardly to be distinguished from himself when crossed with ewes of twelve other breeds; but two of the half-bred ewes, when put to a Merino ram, produced lambs closely resembling the Merino breed."

Here, in the first place, the goat-like ram was prepotent, but his offspring, when mated with such a strong breed as the Merinos, were not able to transmit their characters. It is also on record that of two races of French

sheep, the ewes of one, when crossed during successive generations with Merino rams, yielded up their characters far sooner than the ewes of the other. In other words, the prepotency of the Merino rams was greater in the one case than in the other; which necessitates this conclusion, that prepotency is the *excess of the power of transmission* which one parent has over the other. It is evident that each parent tends, with a certain force, to transmit its characters, and it will transmit them unless the force is met by one superior to it. It is simply a matching of force against force, the stronger force winning here as elsewhere.

Referring again to the examples given by Darwin. In South America there is a breed of cattle called the Niata breed, with certain marked peculiarities. "When these are crossed with common cattle, though the Niata breed is prepotent whether males or females are used, yet the prepotency is strangest in the female line. In making reciprocal crosses of Pouter and Fantail pigeons, the Pouter seems to be prepotent, through both sexes, over the Fantail." These examples will perhaps be sufficient to show that the transmission of peculiar character is due to some power or force in one or the other of the parents, and not that one parent invariably transmits certain characters and the other certain others.

It appears to be a plan of nature, in both the animal and vegetable kingdoms, that in fertilization, the sexual cells shall come from different organisms. The various arrangements in orchidaceous plants are the most well-known examples of this, but it is now known that in many other orders of plants simpler, but equally effective means are provided for securing cross-fertilization, and it is the opinion of the best vegetable physiologists that this cross-fertilization is the rule, and that cases of continual or habitual self-fertilization are quite rare. In the higher animals, the individuals are divided into two groups—in the one, the male sexual cells are developed, and in the other, the female cells. The result of a fertilization in such a case must always be a sort of cross—each animal possessing its individual peculiarities. In the lower forms, where both kinds of sexual organs are found in the same individual, it might be supposed that no such cross-fertilization existed, but even here it is found that fertilization takes place by the congress of two of these hermaphrodite individuals—each fertilizing the other.—*Prof. C. E. Bessey, Cal. College of Agriculture.*

A STAMPEDE ON THE PLAINS.—There is one thing about cattle very hard to understand, even by those who are most intimately acquainted with their habits, and that is, why they will stampede—suddenly become uncontrollable—lose all their senses, and "like mad" tear away in whatever direction they may get started until completely exhausted. Some writer in the *Journal of Agriculture* thus relates his own experience while crossing the plains to California in 1858:

This drive was the longest and hardest I remember to have seen during the entire trip. The morning of the day we made this drive we broke corral some time before daylight; there was not a drop of water in the entire twenty-five miles; the country traveled over was very hilly, and the day hot and sultry. We went into corral near the North Platte, about one o'clock the next morning.

After corral had been made, the oxen had hardly been unyoked when the entire drove, probably maddened by thirst, took one of those terrific stampedes which used to be so well known on the Plains, and for which it was often so difficult to account. They broke straight for the river, jumped into it and made for the other side. Frank and I were already on our mules, bare-back and with raw-hide halters, and after a word or two we agreed to follow them, he going above, and I below the cattle.

The bottom of the Platte is as changeable and capricious as the fluctuations of stock or the gymnastics of a jack-rabbit. Owing to the quicksand formation of its bed, the bottom is a regular map of hills and holes; one moment the water may not be a foot deep, and the next a horse and rider may be plunging and floundering much beyond their depth. I kept down the stream for a distance and then forced my mule over its bank.

The night was very dark and I could see nothing at all; but the cattle could be heard puffing and splashing in the water. I directed my course down stream, my mule alternately wading and swimming, as long as I could hear any of them below me. I went down this way for nearly a mile and then headed for the north bank; but when I reached it my mule was so worn out and the bank so steep that I could not persuade him to climb it—though my persuader was an excellent one, being a heavy, sharp Mexican spur with a rowler about two inches in diameter. I knew that the mule could attend to himself, so I climbed out and left him to go it on his own account.

Of course I could see nothing of the cattle, and being very effectually played out and in a somewhat reckless mood anyhow, I laid down and went to sleep immediately—strongly under the impression that the cattle at the moment were on their way to the British Possessions, and not a particle troubled as to how soon they got there.

It was nearly sunrise when I woke up, and the sight that met my eyes after a little observation was as soul-cheering a one as ever gladdened the heart of a bull-whacker. Above me was the entire herd of cattle grazing quietly, and not two hundred yards below was my mule. Mounting him I soon found Frank. He, too, had been sleeping, but had managed to keep above the cattle, and he and his mule had kept together throughout. We rode through the herd, and there was not a steer missing. The river had cooled their stampeding ardor, and when they had reached the bank they were willing enough to stop for a rest.

First and last, in my experience upon the plains and in the Rocky Mountains, I have seen a good many stampedes among cattle, but never one that ended so pleasantly and harmlessly. Generally speaking there is but little fun in them. Steers on a stampede seem to be entirely insensible to all arguments of entreaty or coercion. They will run over anything from a prairie dog town to a regiment of U. S. troops. Gen. Harney was proverbial for his management of Indians, but even he could never have stopped a herd of cattle on a stampede. When fairly under headway, I verily believe that if the Flag of our Union (long may it w-a-a-a-ve!) or the Constitution of the United States was placed before them, they would'nt pay any more attention to one, or both, than if they were the National Congress convened in regular session to consider the Louisiana troubles. They will run from fifteen to twenty miles, and even farther, going straight on, through or over everything in their way, until they are at last compelled to stop from utter exhaustion. Under such circumstances they have no more sense than a Piute Indian, or a colored member of a Southern Legislature. Then the work of gathering them up—one has to have gone through it to get a proper appreciation. They scatter in a manner most sad and painful to contemplate, and when being driven back to camp seem to realize a most malicious pleasure in wishing to go in any and every direction save the one intended. Oxen are not the most charming creatures in the world, even when acting their loveliest, but on and after a stampede they are particularly and unreasonably despicable and detestable.

THE COW FOR THE DAIRY.—An exchange says: It is notorious that as we breed so we get. If we breed a multitude of qualities in an animal, that multitude shows more or less of its qualities. If we breed a single quality in an animal representing it we get this. This then is safe, and we know what we have to do. There is a difference, for instance, in Short-horns. Some breed more largely—that is, some strains do—for milk than others. These have been cultivated to that end. We therefore use them, and with success, in the dairy. Here we have beef and the milking property united. This, in the English dairies, prevails to a large extent; also to some extent in this country. If we wish a family cow, one only, we select a large milker from the Jersey breed. We select a large milker because there is never a lack of richness of quality in this breed. It transmits faithfully this one valuable property. In breeding the Jersey, therefore, for improvement, care must be had for the quantity rather than the quality of the milk. If this can be secured—and that it can there is no doubt—the Jersey will be the only cow for the dairy. Beef at the end of the term of milking will be no object then, as the superiority in the milking quality will more than balance the advantage of beef. And so it is now with our best milkers. It is an object to keep for milk alone with these. They may be used for milk alone, and the carcass given away, and still be an advantage over the beef-producing animal.

A Colorado cattle-breeder 9,000 feet above the sea finds it more profitable to raise Short-horns than Texan or other common breeds. They do equally well on the native pasturage without other feed, and bring much more clear money, and are less liable to wander away and scatter before the storms. He condemns the scrub breeds, and claims that the Short-horns are as hardy as any and vastly more profitable.

EVERGREENS AS A WINTER PROTECTION IN THE SOUTH.—It is perhaps not generally known how much protection is afforded to tender vegetation by the presence of hardy evergreens, either as hedges to screen from cold and drying winds, or by their overhanging branches to arrest excessive radiation of heat. It is astonishing, sometimes, to see what apparently trifling protection will save the life of plants which are sure to be killed in more open and exposed places. A few dried bushes or a handful of leaves, a sheltered fence corner or the shade of a large tree, will often suffice to carry tender plants safely through the winter. A few green pine boughs set upright around some Eucalyptus trees in two of my neighbor's gardens have have effectually saved them this winter. The protection afforded by a mass of evergreen foliage seems to be something more than a mere screen, or what would be afforded by an overhanging shed or dried straw. Perhaps the living leaves may modify the temperature in some way we are ignorant of. Certain it is, that many half-hardy plants will survive the severe cold of winter when thus protected, which are almost invariably killed when out in perfectly exposed localities.—*Rural Carolinian.*

The *American Agriculturist* says the rich farmers are those who raise grass and roots, and produce stock or butter and cheese, and make manure enough to raise occasional big crops of grain. The poor farmers are those who depend on corn and wheat alone.

A recent report on "Paper making as conducted in Western Massachusetts," contains a list of 112 different materials for making paper, from all of which an article of fair quality can be produced.

Not an untimely suggestion, that the Fourth of July be postponed one month this year, on "account of the weather."

The Dairy.

John Has a Way.

THE cows are coming, Jessie, dear, make haste and see the sight;
There are twenty milky beauties to be housed and fed to-night.
The first one, with the snow-white horns, is just as old as May;
She and my pet first saw the light the same soft Summer's day.

A tender creature was she, so weak and cold and thin!
John said she was not fit to raise. I said it was a sin
To cast her off for Maybud's sake. John laughed and asked me whether
I thought it best, upon the whole, to raise two calves together.

But she was spared, and so was May. It sometimes seems to me,
In Starbright's soft and gentle eyes, May's pleading glance I see.
I love the creature—you may smile—perhaps my fancies mock;
She's the fairest of the herd, as May's the sweetest of the flock.

There's May, her arms 'round Starbright's neck; the girl is mine to-day,
A frolicsome and genial thing, at study or at play;
The darling of our failing years, the spring in our autumn sky,
A fair white jewel blazing in our faded coronet.

But see, John lets the bars down; in clover deep they stand,
With glossy flanks, and backs as straight as yonder table land;
The fragrance of their breath pours in like ambergris and myrrh;
They're just the neatest cows to milk, John says they never stir.

They know his tone—'tis seldom loud; they know his touch, 'tis kind;
"John has a way," the neighbors say, to make dumb creatures mind;
Perhaps—I only know that I, through all these blessed years,
Have never seen the moment when his voice has brought me tears.

—[Hearth and Home.

Fancy Butter Making.

An Eastern "gilt-edge" butter dairy is thus described in an exchange:

The dairy which is and will remain a specialty on this farm, is a great attraction, and nothing is more noteworthy about it than its thorough order and cleanliness—two essentials which are highly important. Every modern improvement that experience has proved to be of value in the best known dairy regions of the county, is supplied. Water is furnished in unfailing quantities from the reservoirs which contribute to every needed place on the farm, and the most perfect arrangements for cooling in the Summer are provided. The cooling pans used are the deep ones, the old theory that the larger the surface of milk, the greater the quantity of cream to be had, being now generally abandoned by the most accomplished dairymen. These pans are nineteen and a half inches in depth, and eight inches in diameter, being in shape like an ice-cream freezer. I saw the tidy woman who superintends the dairy, skim several of these pans, and took the measurement of cream got from one of them, which was a fair average. There was a depth of eighteen and a quarter inches of milk to begin with; the solid cream removed was of a clear thickness of four and three-quarter inches, or a trifle over twenty-five per cent. of rich cream! None of the butter is worked by hand, but passes through a butter worker, an ingenious and excellent contrivance which has been used for some years in the first dairies in Pennsylvania, and which insures absolute cleanliness while doing its work perfectly. The butter made is eagerly demanded in New York, and brings readily there $1 a pound, this being one result of "fancy farming."

Curing Butter.—S. E. Lewis, of Oxford, N. Y., recently gave an address before the Massachusetts Cheese Makers' Association, which is reported in the Boston *Cultivator*, and the editor says it was "the best and most practical talk on butter making that we have ever heard." Mr. Lewis at the close of his remarks referred to the curing of butter, and said butter, like hay, must have time to cure before making. If butter comes white in Summer, when too warm, you cannot wash out the buttermilk at once, and after washing it will still be white. The proper way under these circumstances is to salt it at the rate of 1½ to 1¾ ounces of salt to the pound of butter, and half work it. Then after 24 hours move it over on the worker, then set it aside for another space of 24 hours, or until the third morning after curing, and you will have fine butter and of good color. He thinks to expose butter to light in order to get color, is an error, and that handling and curing butter is a difficult art. He said very truly that the greatest difficulty in the reform of butter making is that everybody makes good butter. No farmer ever carries poor butter to market, because no farmer's wife ever did admit that she made "poor butter;" yet, notwithstanding these denials, there is an immense amount of poor butter that finds its way into the market.

Sturtevant's Twelve Propositions.—Dr. Sturtevant's lecture before the Connecticut State Board of Agriculture may be summarized as follows:

1—The butter product is largely governed by food.

2—There is a structural limit to the butter capacity of each cow.

3—When the cow is fed to this limit, increased food cannot increase the production.

4—The superior cow has this structural limit at a distance from ordinary food, and is more ready to respond to stimuli than the inferior cow.

5—The superior cow is seldom fed up to her limit, while the inferior cow may be fed beyond her limit.

6—The character of the food has some influence on the character of the butter, but breed has more.

7—There is no constant relation between the butter product and the cheese product.

8—The casein is constant, and does not respond to an increase of food.

9—The casein is constant, without regard to season.

10—Increase in the quantity of milk is followed by an increase in the total amount of casein.

11—Insufficient food checks the production of butter, and tends to decrease the casein and to the substitution of albumen.

12—Feed superior cows nearer the limit of production than inferior cows.

Cows Sucking Themselves.—D. M. Worley says that he has a plan for preventing cows drawing the lacteal fluid from their own udder which is far superior to any heretofore recommended. He describes it as follows:

Get your tin-man to make a half-inch tube of heavy tin, well soldered, leaving both ends open, of the proper length to reach through the cows mouth in the manner of a bridle bit. Punch eight one-eighth inch holes in this tube near the middle, and one inch apart, as follows: two in the upper side, two in the lower, and two in each of the other two sides. Solder a small ring to each end, and it is finished. Fasten a string or strap to one ring, put the bit in the cow's mouth, bring the strap over her head and fasten it to the other ring, and she has done sucking herself. Two years ago a neighbor who had a cow that sucked herself, and kept very poor, procured one of these bits and put it on her. She immediately began to thrive, and they had one more cow to milk. My bit made according to the above description cost just 10 cents.

A correspondent of the *Ohio Farmer* writes to that paper that on the first day of last June he commenced feeding his cow on fresh clover and from that time until the fifteenth of October she had no feed of any kind except what clover was cut from one fourth of an acre of ground. He says further that he raised one hundred and fifty bushels of sugar beets and carrots on one-eighth of an acre, and two tons of hay on the balance of an acre and that the roots and hay will keep the cow from October until next June, so that on one and a fourth acres he has kept his cow a year. The cow, he says, averaged through the Summer eighteen quarts per day. [What California farmer can beat this?]

The recent method for improving skimmed milk by the use of oleomargarine, will be likely to throw a considerable quantity of oleomargarine cheese on the market from the creameries; and while this new process of manufacture opens the way for utilizing the skimmed milk in a better manner by turning out a good-flavored, meaty cheese, we hope the distinctive title of "oleomargarine" may be used in placing it upon the market.

The oleomargarine cheese is said to have remarkable keeping qualities, and that it retains flavor much longer than whole-milk cheese. If this be so, it is another reason why the cheese should have a distinctive name.—*X. A. Willard, in Rural New Yorker.*

Relative Cost of Butter and Beef.—Did it ever occur to any of your readers that it takes more feed to make a pound of beef than a pound of butter? A good cow in milk, well cared for, will make two hundred pounds of butter in a season, worth from $60 to $70; but a dry cow, with the same feed, will not gain as much in weight in the same time, nor will she be worth as much as the butter from the dairy cow, and the milch cow is left. An acquaintance of mine is fattening an ox, and in sixty days he had fed him 900 pounds of meal, at a cost of $15, with only 100 pounds gain in weight—*H. W., in Country Gentleman.*

Ten Good Hints.

The following pithy code of newspaper by-laws is the best we have ever seen:

1—Be brief; this is the age of telegrams and short-hand.

2—Be pointed; don't write all around a subject without hitting it.

3—State facts; don't stop to moralize; it's drowsy business; let the reader do his own dreaming.

4—Eschew prefaces; plunge at once into your subject, like a swimmer in cold water.

5—If you have written a sentence that you think particularly fine, draw your pen through it, a pet child is always the worst in the family.

6—Condense; make sure you really have an idea, and then record it in the shortest possible terms.

7—When your article is complete, strike out nine-tenths of the adjectives; the English is a strong language, but won't bear too much "reducing."

8—Avoid all high-flown language; never use stilts when legs will do as well.

9—Make your sentences short; every period is a milestone, at which the reader may halt and rest himself.

10—Write legible.

None for Him.—"Ish dere some ledder here for me?" inquired a German at the general delivery window of the postoffice.

"No; none here," was the reply.

"Vhell, dot is queer," he continued, getting his head into the window; "my neighbor gets someditmes dree ledders in one day, und I get none. I bays more daxes as he does, und I haf never got one ledder yet. How comes dose dings?"

What is it that a poor man has and a rich man wants? Nothing.

Poultry Yard.

Setting Hens---Breaking Eggs in the Nest.

THE following very full discussion of the above subject we find in the *Prairie Farmer*, and as it contains some useful hints to poultry raisers in this State, we give it a place:

A novice, having trouble with setting hens breaking their eggs, wishes to know what to do about it, but she does not give particulars as to how her setting hens are arranged, or what kind of nests they have; so we can answer only in a general way.

Deep nest boxes are sometimes the cause of hens breaking their eggs. Therefore the boxes should be shallow, so that the hens need not jump down on the eggs when going on their nests. This is particularly needful in case the hens are large and heavy. A very good way with such hens is to hollow out a place for the nest on an earth floor, put one layer of bricks around it, and then fill in with a little clean straw or other suitable material. The largest and most clumsy Asiatic will slide into such a nest with as much ease and grace as can well be imagined, and unless she prove to be what some term a "close setter," there will be no danger of her breaking eggs.

By a "close setter" is meant a hen that bears her weight two firmly on the eggs. Some hens have a way of bearing on, or, as it were, closely hugging their eggs, and in this way some are often broken. Such a hen cannot be used safely as a setter, for even should she nearly complete her three weeks' task without accidents, she will almost surely kill a large proportion of the chicks just as they are about to emerge from the shells by her close setting.

The setting of imperfect or thin-shelled eggs is sometimes the only cause of the troubles mentioned. Such eggs should not, of course, be used for this purpose at all.

Hens fighting over their nests is another cause, and when this is the case arrangements must be made whereby such fighting can be prevented. It will sometimes be found necessary to keep some of the more quarrelsome hens covered on their nests all the time, except for awhile each day when they are let off to feed. We cannot always have choice as to what dispositioned hens we are to employ for hatching, but it is well to know which are preferable, in order that the faulty ones may be avoided whenever possible.

In case at any time an egg is broken, the soiled eggs should be carefully washed in warm water and transferred with the hen to a clean nest, which should, of course, occupy the same place as the other. The wetting of the eggs will not injure them at all, but will be a benefit rather, especially toward the close of the period of incubation. It is even well, a day or two before the chicks are due, to dampen the eggs. This may be done by syrinkling or by placing them for a few seconds in a basin of warm water. We prefer the latter plan. The inside lining of the eggs sometimes becomes so parched and tough as to make it very difficult for the chicks to disengage themselves, even when the shell is partly chipped. The dampening of the eggs will tend to prevent this, and the chicks will come out promptly, lively and strong.

One object in setting hens on the ground is to secure the advantage of moisture; but where it is more convenient to have the nests on board floors, the dampening of the eggs as mentioned may be made to answer every purpose.

HOW TO KEEP HENS FROM EATING THEIR EGGS.—A letter from a small boy, thirteen years old, residing at Mount Morris, New York, was read before the Farmers' Club of the American Institute, lately, asking how hens were to be kept from eating their own eggs. He stated that he had an inclined nest with a hole in one end and a box beneath, and found that to be the best way. Mr. Ely said that the hens should be given certain quantities of powdered oyster or clam shells to eat. They must eat something to make their egg shells, and lime and some hard substance was required. Dr. Smith said that the fowls got enough lime in their ordinary food, and that they did not need to be given pounded shells. Nature provided them with what they wanted. He suggested that Mr. Ely should shut up a hen and keep pounded shell from it, and he would find that the eggs would have a shell. Mr. Ely said that he had tried that very experiment, and found that the hen dropped only soft eggs. Other members of the Club agreed with Mr. Ely that it was necessary to give hens pounded shells. Mrr Wolf said that the hens needed lime to make their egg shells. If they got it in their food, pounded shells were not required; if they did not get enough lime in their food it should be given them in some form. A stranger asked how it was that so many eggs came from parts of the West where there was no shell. Dr. Wells said that the fowls got what lime they needed in the water they drank.

Probably the best way—and a very convenient way, too—to supply hens with lime is to pulverize bones which have been burned and give to them; or, lime itself will be found sufficient.

Pisciculture.

Fish Culture.

THE experience of the past few years has confirmed the opinions of those who have contended that it was not only possible but practicable to raise fish and to restock the streams and rivers which once abounded with food fishes, but which, from various causes, have been depopulated. Not only the native varieties can be brought back, but valuable species from foreign countries or from distant portions of our own country can be introduced and naturalized. The fish crop is destined to become as much a matter of certainty as any product of the land, and one which is capable of indefinite increase.

The *Journal*, referring to this subject, says it has been noticed that the smelt on our sea coast were never so large as during the last season, and the result is attributed to the protection of the laws during the season of spawning and growth. In New York the plentifulness and cheapness of the North River shad this Spring have been often noticed by the newspapers. This seems to be due in a large degree to the action of the State Commissioners of Fisheries, who last year placed five millions of young shad in the Hudson river. It is no wonder that the prices of the grown fish fell to about one-third of the former rates, thus bringing what used to be considered a luxury within the command of all.

This instance must be very gratifying to those who, amid opposition, ridicule and, what is still worse, the blank indifference of the public, have steadily labored to realize the modern theories of fish culture. What has been done with shad can also be accomplished with other kinds of fish, according to circumstances. The New York Commissioners are confident that their introduction of the California salmon into the waters of their State will prove equally successful, even in the Hudson river. During the last year alone they distributed forty-three boxes of salmon trout eggs, three boxes of brook trout, and five boxes of white fish; besides 181,000 salmon, 1,080,300 salmon trout, 527,000 whitefish, 240,000 California salmon, and 2,176 bass and perch. They placed 36,000 young eels in Buffalo Creek, above Niagara Falls, in order to see the result of introducing them into Lake Erie.

When we remember that the State of New York has six hundred and forty-six lakes—some of them entitled to be called seas as to size—to say nothing of its rivers and streams of all kinds, we can see what a field is here opened for adding to the wealth and comfort of the people. And what is true of New York in this respect is equally true of all our States according to their natural resources. The work has been shown to be feasible and easily accomplished, provided only it receives a proper degree of public interest. What is everybody's lookout is nobody's, according to the old saying; so that no matter how much progress is made in developing the best methods of fish culture, and how much pains is taken by commissioners in stocking waters with the young fish, the latter must have the protection of suitable regulations, steadily enforced, or failure will be the inevitable result. Among other legal provisions recommended by the New York Commissioners, is one forbidding any fishing to be done from Saturday night to Monday, which ought to be adopted on moral as well as protective grounds. The whole subject deserves careful attention, and we are glad to observe that it is receiving it to an obviously greater extent every year.—*Prairie Farmer.*

SEA SALMON IN FRESH WATER.—The question as to the ability of the salmon to remain permanently in fresh water has received an important illustration during the past winter. It is well known that the lakes of Maine along the coast contain a variety of fish known as the land-locked salmon, which, while possessing the external appearance and peculiar habits of the salmon, together with equal excellence of flesh, is much smaller, and remains permanently in the lakes; and it is still a vexed question whether this is actually a descendant of the true sea salmon or a different species. An argument in favor of its being the former is afforded by the fact that in two localities young salmon, hatched from the eggs of the true sea salmon collected at Bucksport, have lived in fresh water ponds, and yielded ripe eggs during the past autumn; in the one case at New Hope, Pennsylvania, the fish attaining several pounds in weight, while some bread in Wisconsin were only five to seven inches in length, though perfectly mature in every respect. In the first case, however, the ponds were quite large, and offered ample space for the movements of the fish, while in the other they were confined to small trout ponds of only a few yards in extent. Whether the eggs thus obtained will produce healthy young, and whether these will attain maturity, are questions of much interest.—*Harpe'rs Magazine for June.*

GENERAL SPINNER writes as follows to Mr. Seth Green, the pisciculturist: "The time will come, if it is not already here, when the credit of having demonstrated that an acre of heretofore water waste is worth more for the production of wholesome food for man than an acre of the most fertile land, will be awarded to you."

THE Fish Commissioners of the State of Connecticut report that 1,359,000 young salmon have been introduced into the Connecticut river during the past year, and that a like number will probably be put in during the present month.

THE State Fish Commissioners have received word from the East that a large number of young shad will be sent out this summer to stock the California streams.

At a recent spelling match one man spelt it "parsnip" and got beet.

Apiary.

A Stinging Subject.

My wife is very prond of our garden, and while gushing over it the other morning, a happy thought worked its way under her back hair.

What a delightful thing it would be to have a hive of bees and raise our own honey, as well as everything else.

I have always thought that woman inspired ever since she convinced me that I couldn't do better than to marry her.

This was an original, bold idea; happy thought; glorious idea. I promised her a hive of bees, and went to business with a lighter heart and a firmer belief in the genuineness of home comforts and amusements.

I bought a hive of honey-bees and brought it home with me that very night.

It was one of those patent, hydrostatic, back-action hives, in which the bees have peculiar accommodations and all the modern improvements.

It was a nice little hive, none of your old-fashioned twists or barn-size affairs.

It even had windows in it, so that the bees could look out and see what was going on, and enjoy themselves.

Both myself and Mrs. B. were delighted, and before dark I arranged a stand for the hive in the garden, and opened the bay windows so that the bees could take an early start, and get to business by sunrise next morning.

Mrs. B. called me "Honey" several times during the evening, and such sweet dreams as we had.

We intended to be up early the next morning to see how our little birds took to our flowers, but a good half hour before we probably should have done so, we were awakened by the unearthly yells of a cat.

Mrs. B. leaped from her downy couch, exclaiming:

"What can be the matter with our Billy?"

The howls of anguish convinced us both that something more than ordinary was the matter with him, and so we hurried into our toilettes without waiting to do much buttoning.

We rushed out into the garden, and oh! what a sight met our astonished gaze!

The sight consisted of a yellow cat that appeared to be doing its best to make a pin-wheel of itself.

It was rolling over and over in the grass, bounding up and down, anon darting through the bushes and foliage, standing on its head, and then trying to drive its tail into the ground and all the while keeping up the most confounded howling that was ever heard.

"The cat is mad," said Mrs. B. affrighted.

"Why shouldn't it be? The bees are stinging it," said I, comprehending the trouble.

Mrs. B. flew to the rescue of her cat, and the cat flew at her.

So did the bees.

One of them drove his drill into her nose, another vaccinated her on the chin, while another began to lay out his work near her eye.

Then she howled and began to act almost as bad as the cat.

It was quite an animated scene.

She cried murder, and the neighbors looked out from their back windows and cried out police, and asked where the fire was.

This being a trifle too much, I threw a towel over my head and rushed to her rescue.

In doing so, I ran over and knocked her down, trod upon the cat and made matters no better.

Mrs. B. is no child in a wrestle, and she soon had me under her, and was tenderly stamping down the garden walk with my head, using my ears for handles.

Then I yelled, and some more bees came to her assistance and stung me all over the face.

She was still giving me darby, under the impression that I was the cause of all her pain.

It was love among the roses or something of that nature.

In the meantime, the neighbors were shouting and getting awfully excited over the show, while our servant, supposing us fighting, opened the street door and admitted a policeman, who at once proceeded to go between man and wife.

The bees hadn't got at Mrs. B.'s tongue yet, and she proceeded to show the policeman that I had abused her in the most shameful manner, and that I had bought a hive of bees on purpose to torment her into the grave.

I tried to explain, but just then a bee stung the officer on the nose, and he understood it all in less than a minute.

He got mad; actually lost his temper.

He rubbed his nose and did some official swearing. But as this didn't help matters, he drew his staff and proceeded to demolish the patent bee-hive.

The bees failed to notice his badge of office, and swarmed on him.

They stung him wherever he had no clothing, and some places where he did have it.

Then he howled and commenced acting after the manner of the cat and its mistress. He rolled on the ground for a moment, and then got up and made a straight line for the street, shouting fire.

Then the bees turned to the people who had climbed upon the fence to see the fun. The excitement increased.

Windows went down, and some of the neighbors acted as though they thought a twenty-inch shell was about to explode.

By this time a fire engine had arrived, and a line of hose was taken through the house into the garden.

One of the firemen asked where the fire was, but just then one of those honey mosquitoes bit him behind the ear and he knew directly.

They turned a stream upon the half-ruined bee-hive and began to "play away" with one hand, while they fought the bees with the other. But the water had the desired effect, and those bees were soon among the things that were.

A terrible crowd had gathered in the meantime in front of the house, but a large portion of it followed the flying policeman, who was rubbing his affected parts and making straight for the station house and a surgeon.

This little adventure somehow dampened our enthusiasm regarding the felicity of raising our own honey.

During the next week we wore bread and milk poultices pretty ardently, but not a word was said about honey, and now Mrs. B. has gone to stay a week with her mother, leaving me and the convalescent Tom cat, and the tickled neighbors, to enjoy our own felicity, but not with bees—oh, no!—*Story Teller.*

The Bee as a Scavenger.—A mouse found its way into the hive of one of our amateur bee men not long since, and the intruder was found dead and completely imbedded in wax. The mouse, having a sweet tooth, crept into the hive to steal honey, but unfortunately aroused the inmates, and before he could find his way out again was stung to death. By-and-by decomposition set in, and Mr. Mousey began to disseminate a bad smell, which bees cannot tolerate; but finding it impossible to hustle him over the ramparts, as they do other nuisances, they went energetically to work and sealed him up in wax, hermetically sealed him, in fact, so that not the slightest odor escaped to make the hive unpleasant for the high-toned, extremely neat and cleanly inhabitants.—*Scholastic Republican.*

Handling Bees.—I commenced helping my father handle bees in 1818. I have handled them in the old way most of the time. I have a few gums of my own getting up that I can go to, and in one minute have them open, lift the frames and give them a thorough examination. Long since I found that one should move slow around the hives, and if the bees should surround him, or even come within an inch of his nose, he should be composed. If he should get angry the bees will know it and reciprocate it, and so will they know if you are at ease with them. When you open the hive, if they seem angry or disturbed a few puffs of smoke will entirely subdue them, and you can proceed with your examination.—*J. Frost in American Bee Journal.*

A Plant Destructive to Bees.—The large podded milk weed, almost invariably causes the death of every bee alighting upon it. The bee either adheres to the plant or else bears away a small scale sticking to its feet, and cripples itself fatally in attempting to remove the annoyance.—*Agricultural Report.*

Why Farming is Unprofitable.

The question, "Will farming pay?" has been discussed before the New Hampshire State Fair as follows: It is complained that farming is unprofitable. Men are leaving the farm and seeking employment in manufactures and the trade of the city. New Hampshire, the agricultural part of Massashusetts, of Maine and Vermont, have gone back in population and productive agricultural wealth in the last ten years. Without seeking to touch all the reasons for it, may we not find it largely in this, that we ask too much of the farm? Having a capital of $2,000, $3,000 or $5,000 invested in it, we ask that the farm shall support our families, educate our children, and give us a comparative wealth for old age besides. And yet, do we treat it as other men do their business by which they succeed? If we fail in getting all this from it, we say at once that farming is unprofitable! We are unmindful of the fact that in mercantile business, only one in a hundred is fairly successful, and only one in a thousand eminently so. Does not farming do as well as that, and better? Does only one in a hundred farmers succeed to a competence, and only one in a thousand succeed to affluence? And yet do we not deal with our farms in the same way that we have seen that the nation does with its producers? Do we not take everything off and put comparatively nothing on the land? In every other business of life all the gains a man gets he immediately puts back into his business. The merchant increases his capital year by year, from gains of the preceding year, if he is a prudent man, until it becomes as large as he can profitably manage. But if the farmer makes any surplus on his farm, as a rule, does he return it to his land, either in increased facilities for farming, in enriching the soil, adding to his stock, or draining his land? On the contrary, is he not much more likely to invest in railroad shares or bonds, or some manufacturing enterprise, or loan it to some neighbor? Having taken away from the farm what the farm has brought him, and ought to be returned to it again, to make it more productive, he leaves it impoverished, and then complains that the gains do not increase. Is not the difficulty that he is continually taking away the increase of his capital and leaving it only what it was at the beginning? The merchant, as we have seen, increases his capital year by year; but the farmer too frequently takes his and invests it in other enterprises, and then complains that the farm does not succeed. No farmer we ever heard of ever mortgaged his farm to put manure on it; yet men frequently do mortgage their farms for the purpose of building a fine house; and many take all the earnings of the farm for ten years for that purpose. The mortgage, or the indebtment, once on a farm, as a general rule in the past, except in the change of fortune made by the change of prices arising from the war, remains years, if not to say forever.

The Horse.

Good Things About Mules.

MULES are easier kept than horses, because they eat less and will keep in good condition on poorer food. They are by far less liable to disease. They are more hardy, and will endure degrees of heat and cold that would greatly injure horses. If they sometimes refuse to go, they are rarely known to run away, and, accordingly, they do not break harness, wagons and carts, not to speak of legs and arms. They are not naturally vicious, and most of their bad characteristics may be ascribed to defective education and to bad examples.

The power of endurance of mules is much beyond that of horses. They are also surer footed. They are, accordingly, better adapted as beasts of burden to travel in a warm climate, to endure fatigue, and to make trips over mountains. Mules are almost the only reliance of the inhabitants of Central and South America. They are used for drawing plows, harrows and harvesters, and for taking produce to market, and for all purposes of traveling. In the Southern States they perform nearly as many useful purposes, and there is hardly a cotton, cane or tobacco raiser who would think that he could raise one of these crops without the use of mules.

For plowing between the rows of cultivated crops the mule is in many respects the superior of the horse. His feet are smaller, and, accordingly, do less damage in stepping upon plants. His skin is tougher, and therefore is not so liable to be injured by defective harness. The gait is more uniform and accordingly the driver is not so likely to become wearied. As a rule, mules are less liable to become irritable and fractious on account of the presence or bites of insects, and consequently, do less damage to crops among which they work.

Mules may be put to work much earlier than horses. There is in this respect at least the advantage of one year in the favor of the mule. In other words, the mule will do as much work when three years old as the horse will when four. The mule not only begins to pay his way much earlier but continues to be useful much later in life. We have repeated accounts of mules continuing to do good service after they were forty years old. A mule, the property of the late Prof. Mapes, of New Jersey, was healthy, active and fit for labor when it was sixty years old.

It is urged that the mule is slow and awkward, but these faults are largely the results of bad breeding. As a rule, no care is taken in breeding mules. The dams of most mules are animals that no farmer would want to raise colts from. They are themselves slow and awkward and oftentimes lame and diseased. It is not to be wondered at that these defects reappear in the offspring of these animals. Horses would be slow and awkward if they were raised from animals of this sort, and we can expect nothing different in the case of mules.—*A.*

HORSES vs. MULES.—Much has been said in agricultural papers about the advantage of mules. I have raised some of the best I ever saw, and have had some means of comparing them with the horse. It is very true that the mule will climb a steep hill, if it is free from mud, with a bigger load according to his weight than a horse. It is true that he will rough it through a hard Winter better than a horse, and it may be also that he is less liable to disease than a horse, but he is slow and lacks spirit. In deep mud he is almost worthless.

He seems to have but little power to draw his feet out of sticky soil, and the exertion tires him and he loses heart. In a slough where the spirit of the horse prompts him to a gallant struggle to regain the solid ground, the mule gives up and lies contentedly down in the mud. Of course some mules are worse than others in this respect, but none are equal in mud to the most average horse.

For very hard, heavy work, where there is no mud, the mule will always be valuable, but as long as it remains true that time is money we must prefer the horse to the mule.

The rage for mules commenced in the United States about seventy-five years ago and has been revived at different periods since; but the horse still continues to bear sway, and falsify the oft repeated predictions made many years ago that the mule would eventually supersede the horse in the general work of the farm. For heavy hauling and rough usage on the hard streets of cities I have no doubt but that the mule is the most economical. For this sort of work there is a demand for him, and he may be raised for the market with profit; but it is simple folly for any one now, after seventy-five years of experience with mules in the United States, to talk about their taking the place of horses.—*Cor. Iowa Fine Stock Gazette.*

WINDOWS IN HORSE STABLES.—A German paper states some curious facts relating to the position of windows in horse stables, and their power to affect the eyes of horses of a farmer—fine animals, celebrated for their excellent condition, were kept in a stable lighted only by a small window at one side. When light was needed for work, the door was temporarily left open; the result was that nearly all of these animals had eyes of unequal strength, and in time a number of them became blind on the side toward the window.

Strong light directed in the horses' faces has been found to weaken the sight. The worst position of all for a stable window is in front of the horses and much higher than their heads. An officer had bought a perfectly sound mare from a gentleman whose stable was lighted by windows at the rear of the stalls. The animal was sound and perfectly satisfactory. After three months she became suddenly "ground shy;" on examining her eyes they were found directed upward, and this was explained by the fact that the windows of the officer's stable were situated above the head of the stalls, the eyes being generally drawn in that direction. She was removed to another stall, where the light was admitted from all sides, and in three months' time the difficulty had disappeared.

SOCIAL MORALS IN HORSE-BREEDING.—A horse breeder says: In selecting breeders, great care should be taken relative to the social morals of both horse and mare. Like begets like, and in no case more so than that of the horse. A bad and vicious temper in a horse may be checked, but never eradicated, and he will be unpleasant, dangerous, and his fretting and fuming will unnecessarily waste his strength.

A man bought a horse. It was the first one he ever owned. He saw in a newspaper that side windows in a stable make a horse's eye weak on that side; a window in front hurts his eyes by the glare; a window behind makes him squint-eyed; a window in a diagonal line makes him shy when he travels; a stable without a window makes him blind. He sold his horse.

A horse is never vicious or intractable without cause. Cruelty makes a horse wild. Good men make good horses.—*Ex.*

Following the startling frauds in the whisky business comes the unearthing of gigantic swindling in the importations of silk. In two years, it is currently believed that the Government has been cheated out of at least $1,000,000 at New York alone. How much at other points is unknown. Of course, more or less of the custom house officers are concerned in the matter. In what direction shall we look for the next steal?

Porcine.

The Berkshire Hog.

IT a late state fair in the East, there was not one white hog exhibited. All were black, and either Berkshire of Essex. At the largest of the Western state fairs, that of Illinois, nearly all the hogs were black, or black and white. This would seem to indicate the rapid growth of the black breeds in public favor, and of these the Berkshire takes the lead. As well indirectly as directly, for in the Poland Chinas of the West is seen, in the majority of cases, the Berkshire blood greatly predominating. The Berkshire has been most carefully bred for many years, starting from what was originally a large breed, possessing many good points, and of a black and white and yellowish spotted color. The improvement of the old Berkshire hog was begun in England by Lord Barrington, who died in 1829, and most of the best herds now trace back to this original improved herd. By careful breeding the yellowish color has been gotten rid of, and the white has been confined to the feet, a spot between the eyes, and in some cases a few white hairs near the shoulders, although there are herds in which these last white marks are entirely bred out. The Berkshire, as we now know him, is a moderately large hog, with a smooth, round carcass, broad across the shoulders, with well developed and round hams, a long, deep flitch, very fine, small, bony legs and feet, short face and snout, and covered with a good coat of long, silky, black hair. In many good Berkshires, the bluish or slate colored tint and thin hair of the Neapolitan hog, which has been crossed upon it, is very conspicuous; but it is a question if the black, well-haired animal is not the more vigorous and thrifty sort. One of the chief characteristics of the Berkshire is the evenness with which it breeds. At the exhibitions and in the breeders' yard, whole litters may be seen that scarcely vary from each other, and hardly to be distinguished one from another in appearance, and pen after pen may be examined without any marked variation, excepting in those cases in which, as already noted, the Neapolitan cross is apparent. After fifty years of careful breeding, this is not more than might be expected, and the result appears in an animal which, on the whole, is probably the most profitable to the breeder, the feeder, the butcher and the packer. There is no pig that is more useful to the man who keeps but one, and more to the farmer who feeds a hundred, if the amount of meat in proportion to feed consumed is considered. There is more lean in proportion to fat than in most other, if not in all other breeds, and the bone and offal are very light. The black color is not only skin deep, but the color lies in the outer skin, which is all removed by scalding, and a Berkshire ham is not to be distinguished from that of a white hog, if the hair has not been left on to tell the story. It is no little evidence of its good qualities that the Berkshire has become so rapidly popular, in spite of the prejudice against its color, as to supplant, along with the Essex, all the white breeds, at one of the most prominent Eastern state fairs.—*Home Journal.*

THE following experiment is vouched for by the *Kansas Farmer* as coming from a good and reliable farmer. As showing the relative value of corn and wheat for fattening hogs, it is valuable: He took one hundred hogs and put fifty in pens and fed corn, and fifty and fed wheat, with the following result: Those with corn made eleven pounds per bushel; the fifty with wheat made seventeen pounds of good solid pork per bushel of wheat. The wheat was ground like meal, boiling water poured over it, and then let stand forty-two hours.

We have found that the Berkshire and Essex make an excellent cross for feeding purposes. As a principle, I do not consider it advisable to cross the improved Berkshire with any other on their own account, but prefer rather to keep that breed distinct and up to the mark by occasionally renewing with a foreign blood of its own kind. By foreign blood I mean that of a distant or unrelated family. They are a standard breed, very near perfection in themselves, possessing qualities that cannot be much improved upon without affecting the combination that constitutes the Berkshire and stamp them with a character wholly their own, and which only requires to be kept up to the ideal of their style and perfection to satisfy the requirements of almost every class, condition and locality. The true well-bred Berkshire has the stamp of the thoroughbred, and possesses the merits required for its purpose, and great pains should be taken to perpetuate the purity of that blood. However, when it is necessary or advisable to cross them (for the reason before given) it should be made with the Essex whenever practicable. The result of a single cross will always give satisfaction, the produce being such as will feed quick and mature sooner than the pure-bred Berkshire, and the pork is second to none that goes to market. The general style and appearance of the animals will be similar, except in the markings; some will be more or less spotted, some marked like the Berkshire, some partially marked, and some all black. The cross continued upon itself will soon lose its identity with either breed, and eventually will result in a lot of mongrels.—*Ex.*

Keep Them Fat.—A practical farmer, in communicating his views in the columns of one of our exchanges, says: Keep your hogs fat. The good farmer gives all his young stock a good fat start in life, because he knows it always takes twice or thrice as much to feed a poor horse, cow, or hog, as it does one in good condition. It ought never to be necessary to keep "killing hogs" in the "fattening pen" longer than a week or ten days—just long enough to harden their fat with grain. The hogs ought to be fat to begin with. In fact, the good farmer never has a poor animal of any kind on his place. It pays well to push young pigs from the word "go"—that is, as soon as they are able to crack corn. We knew once a litter of thirteen, half Beskshires, dropped in February, that under this plan, without going into the fattening pen at all, eleven months later averaged 175 pounds net meat—total 2,276 pounds—and the heaviest one was a "runt" at the start.

A New Hog Disease.—A Greenville, Ohio, correspondent of the *Cincinnati Gazette* says: The pigs in our settlement are having a new and strange disease commencing in the head and nose. Symptoms: First, the nose swells, the swelling lasting a few days. Then the nose and head get sore. The sores appear to be of an eating nature. They get larger, and spread over the pig till dead. We have lost over one hundred, and saved perhaps six or eight out of all that took the disease. But even the saved ones are of but little account.

The saying "Excuse haste and a bad pen" has been attributed to a pig who ran away from home.

When a hog roots in a snow bank its nose knows snows.

Gems.—Indifference to the welfare of our country is a crime; but if our country is reduced to a condition in which the bad are preferred to the good, the foolish to the wise, hardly any catastrophe is to be deprecated or opposed that may shake them from their places.

Horticulture.

Heading Off Borers.

Mr. B. Hubbard, writing to the *Rural New Yorker* on the subject of borers in peach trees, says:

I will not waste time to refer to the various expedients to which I have resorted, but hasten to state that at the introduction of Hale's early peach I procured fifteen one-year old budded trees, took extra pains with them, and discovered the next season that the borers had commenced their depredations. I worked at them, knife in hand, for several years, until I had mutilated them very badly. I began to look about for some more effectual remedy. I prepared boxes of inch boards, eleven inches square, ten inches wide; put one around each tree; filled each with damp, leached ashes, pounded down slightly; smoothed the surface nicely, with a damp shovel, quite up to the trunk, and called the work finished. This was the last trouble I experienced with my fifteen trees, and to my mind this is an effectual remedy. The beetle cannot puncture the bark at that distance from the ground, it being dry and hard, and being no ingress or egress, reproduction must cease, of course.

N. B.—This wooden structure will decay after a time. I suggest instead of boards use bricks, which are easily placed about the trees, need no mortar, as the pressure is very slight, and the material indestructible. The expense will be trifling compared with refitting occasionally with wood. I claim not that this remedy is infallible; but this I do know, that for a series of years in my experience it has proved an entire success, and I think from its simplicity no one should be so skeptical as to fail to make the experiment. I speak somewhat positively, but I apprehend my zeal is according to my knowledge.

[If the trunks of the trees are shaded from the sun with boards it will answer the same purposes.—Eds.]

Lime for Apple Trees.—A successful pomologist of New Jersey writes the New York *Herald* that he once noticed that a tree standing in the immediate vicinity of his dwelling had all at once put forth with renewed energy and he was at a loss for some time to define the cause. On examination he found that a quantity of lime, which had accidentally been spilled, and rendered worthless by becoming mixed with the refuse on the stable floor, had been thrown at the foot of and around the tree, and to this, as the principal cause, he immediately accredited the revivement and renewed fructification of the tree. Taking the hint from the incident, he purchased twelve casks of lime, and applied half a bushel to each of the trees in his orchard, and found that it produced immediate beneficial results. Not the health of the tree only but the quality of the fruit also was greatly improved. The *Herald* adds that it has known some farmers to make it a regular practice for a succession of years to throw caustic lime around their apple trees in the spring and summer.

In our own experience on the farm we found that leached ashes worked about the same result as given above. A pear tree close by a leach grew twice as rapidly as one a few rods away.—*Ohio Farmer.*

The Black Pepper.—The two specimens of the black pepper tree planted in the Courthouse yard a year old, with a view of testing its adaptability to this climate, made a rapid growth last summer, but the past winter was unusually heavy, and the frost killed most of the leaves and tips of the twigs. Enough is determined, however, to show that black pepper can be produced here in any desired amount, and that it is capable of becoming an article of export. The tree is an evergreen, and has a strong resemblance to some of the varieties of acacia.—*Tulare Times.*

Value of Evergreens Among Fruit Trees. A well-grown evergreen tree gives off continually an exodium of warmth and moisture that reaches a distance of its area in hight; and when tree planters advocate shelter belts, surrounding a trace of orchard fifty or more acres, when the influence of such belt can only trace a distance of the hight of the trees in said belt, they do that which will prove of little value. To ameliorate climate, to assist in prevention of injury against extreme climate, to assist in prevention of injury against extreme climatic cold in winter and of the frosting of the germ bud of fruit in the spring, all orchards should have planted, in and among them indiscriminately, evergreen trees at distances each of not more than 150 feet apart. Such a course pursued will give health to the tree, and be productive of more regular and uniform crops of fruit. At all events, it is worth the trial, and we shall be glad if our readers can inform us of practical experiments on the subject.—*Scientific American.*

Ripening Fruit.—Acting upon the principal that removal of the earth immediately surrounding the roots increases their activity and accelerates the maturing of all parts of the plant, including the fruit, Mr. Stall removed the earth about an early pear tree eight weeks before the normal period of ripening, for a space of thirteen to fifteen feet in diameter, and to such an extent as to leave a depth of earth over the roots of only about two to four inches, which could be thoroughly warmed by the sun. He was surprised not only by the ripening of the fruit in the middle of July, but also by its superior juiciness and flavor. In another experiment the removal of the earth from the north side of a tree alone caused the fruit on that side to ripen several days earlier than that on the south side. Frequent watering was of course necessary in the above experiments.—*Vineyard Gazette.*

The cranberry is cultivated in Wisconsin and some of the other Western States on a pretty large scale, by simply building dikes for keeping out surplus water from the swamps on the margin of lakes. It is claimed that a capital of only twenty dollars per acre is required for successful cultivation of the cranberry there, while, in New England, it often costs from two to three hundred dollars per acre. Several gentlemen interested in the cultivation of this fruit at the West have lately visited Eastern capitalists and a meeting for discussing the subject has been held in Music Hall, Boston.

Market-Gardening in the Rural Districts.

The census often shows the drift of farm-life more accurately than any partial observation, however minute. It is quite clear, from the returns already examined, that there is a decrease in the amount of live-stock in the New England and Middle States during the past decade, and likewise a decrease in the yield of stable grains, while there will be shown a large increase in the crops of vegetables and in garden products. This shows pretty conclusively that grain-farming and live-stock raising, does not pay so well as some other branches of farming. The city and village population has increased, and the farmers in the immediate vicinity of these large towns are turning their attention more to supplying their daily wants. They can sell potatoes and turnips every day in the year if they have them, and garden products although the summer and fall. There is, however, a brisk demand for poditry, eggs, milk, calves, lambs, and swine, and they very properly raise what the market demands.

How much does a fool generally weigh? A simple ton.

The Flower Garden.

How to Take Care of Bulbs.

AS soon as their beauty of flower is over, we always cut off the flower stems just below the lowest flower, and for this reason: the hyacinth and tulip both seed freely, particularly the latter; if the bulb is forming seed, its strength is in a great measure wasted by that process; whereas if the flower-stem is cut off, the bulb has nothing to do but to prepare itself with vigor for blossoming the ensuing year. We pay great attention to the protection of the leaves of both hyacinths and tulips, and never allow them to be interfered with until nature indicates, by the decay of their points, that the bulb is preparing for rest. We then follow a course with both hyacinths and tulips which we believe many do not; that is, we take them up before the leaves are quite decayed, and for this reason: we believe that both of them, after the bulbs have attained this period of growth, are only weakened by remaining in ground, because the offsets are living upon the parent bulb, and consequently weakening it for the flower of the following year. If a cultivator wishes for stock, he should let his bulbs remain until the leaves are quite decayed. If he wants his bulbs to flower in beauty again, he should follow the practice above mentioned. When taken up, the bulbs should be removed to a shed sheltered from the sun but free to the air, and any earth adhering to the fibres or roots should remain for some little time; after two or three days they should be looked after and the loose earth shaken from them; and, as the leaves decay, they should be occasionally removed. We have generally placed our bulbs at first on the ground, in the tool-shed, and as they got dry removed them to an airy shelf. When the leaves are nearly decayed, we place them in very shallow baskets, and allow as much air as practicable to be between each root to harden them, turning them every two or three days. By this treatment, and rubbing off any portion of mold attached to the bottom and sides, they are in a fit state to be placed for the summer in a dry room; and by a little occasional attention, the rough and outside coat will, by a gentle side-pressure of the thumb, be effectually removed, and exhibits the appearance of the bulb clean, smooth, and in good condition. This latter operation is best performed in the end of August, and at the end of that time remove the remains of such parts of the root of the former year as may have dropped off previous to this time. It is hardly necessary to state that any bulb in an unsound state, either from appearance of decay or from having been injured in taking up, should not be put with those intended for future planting.—*The Garden.*

TUBEROSE BULBS—HOW TO PRESERVE THEM. There are a few rules that the novice in these matters must bear in mind. Do not undertake to dry the bulb with all the top on; do not cut it off too near the crown of the bulb. Either proves injurious. The first, because there is such a mass of green, succulent growth to wither up, and consequently to engender decay; and the latter because there will be great danger of destroying the germ in the center. I have seen bulbs to all outward appearances sound and healthy, but when I examined this vital point I found it gone beyond recovery, and the bulb was necessarily worthless. My practice is to dig them as soon as the first frost injures the leaves, cut them down to say three inches of the bulb, and then spread them thinly on a shutter, or, what is better, a slatted frame, and place them in the sun or near the fire heat, until every vestige of moisture has departed. It is really wonderful how much vitality there is in the leaves of this beautiful flower, for not unfrequently one has to wait for several weeks before they are ready to store away. When once thoroughly dried, I simply place them in a box without any packing material whatever, and keep them in a warm and perfectly dry place. The cellar near a furnace will answer, provided there is no dampness in the air. It is a good plan to examine them carefully during the winter to see if there is any moisture present, and if it is detected, take them out at once, and again spread thinly over the top of a furnace or other surface, to remain until dry once more.—*Ex.*

Educational.

What Should Young People Read?

IT is very hard for boys and girls between ten and twenty to believe what older people tell them concerning the selection of reading matter. If a book is interesting, exciting, thrilling, the young folks want to read it. They like to feel their hair stand on end at the hairbreadth escapes of the hero, and their nerves tingle to the ends of their fingers at his exploits, and their faces burn with passionate sympathy in his tribulations—and what harm is there in it? Let us see what harm there may be. You know very well that a child fed on candy and cake and sweetmeats soon loses all healthy appetite for nutritious food, his teeth grow black and crumble away, his stomach becomes deranged, his breath offensive, and the whole physical and mental organization is dwarfed and injured. When he grows older he will crave spices and alcohol to stimulate his abnormal appetite and give pungency to tasteless though healthful food. No man grows up from such childhood to have positions of trust and usefulness in the community where he lives. The men who hold those positions were fed with milk and bread when they were young, and not with trash.

Now, the mind, like the body, grows by what it feeds upon. The girl who fills her brain with silly, sentimental, love sick stories grows up into a silly, sentimental, lackadaisical woman, useless for all the noble and substantial work of life. The boy who feeds on sensational newspapers and exciting novels has no intellectual muscle, no commanding will to make his way in the world. Then, aside from the debilitating effect of such reading, the mind is poisoned by impure associations. These brilliant stories have always murder, or theft, or lying, or knavery as an integral part of their issue, and boys while reading them live in the companionship of men and women, of boys and girls, with whom they would be ashamed to be seen conversing, whom they would never think of inviting to their houses and introducing to their frends, and whose very names they would not mention in polite society as associates and equals. Every book that one reads, no less than every dinner that one eats, becomes part and parcel of the individual, and we can no more read without injury an unwholesome book or periodical than we can eat tainted meat and not suffer thereby. Just as there are everywhere stores full of candy and cake, and liquor, and tobacco, and spices, so there are everywhere books, newspapers and magazines full of the veriest trash, and abounding in everything boys and girls should not read. And just as the healthful stomach, passing all these pernicious baits, will choose sound aliment, so the healthful mind will reject the unwholesome literature current everywhere, and select such as is intrinsically good.

The other day we picked up a popular juvenile weekly, and presently found ourself knee-deep in slang, over our head in vulgar allusion, and in the midst of a low-lived metropolitan crowd, where cock-fights, dog-fights and man-fights were the condiments offered to whet the appetite for reading; and yet we know families where that paper is regularly taken. Do the parents read it? Do they know what company their children are keeping?

But, says the young inquirer, What shall we read, and how shall we know if books are suitable? Read such books as give you valuable information, works that are approved by people of correct judgment. Our leading magazines contain a vast amount of reading, interesting alike to young and old. Do not read what renders distasteful the duties of life, or renders vice attractive, or makes you long for an impossible and romantic career. A correct taste, once formed and carefully consulted, will enable you to select the good and eschew the pernicious.

"Might I give counsel to any young hearer," says Thackery in his lecture on Prior, Gray and Pope, "I would say to him, try to frequent the company of your betters. In books and life that is the most wholesome society; learn to admire rightly, the great pleasure of life is in that. Note what the good men admire; they admire good things; narrow spirits admire basely and worship meanly.—*N. Y. Tribune.*

IT is often said that students of agricultural colleges do not, in after life, pursue agriculture as a profession; but this cannot be applied to the college at Lansing, Michigan. According to President Abbott, at least forty-two per cent. of the living graduates of that institution are engaged in farming or gardening. If all our agricultural colleges can make this kind of a showing, there will be less cause for growling about them than people suppose.—*Prairie Farmer.*

ONE of the most important errors in education is the idle vanity that looks for everything before its time, and will have fruit before flowers, in order to enjoy the surprise of the guests at seeing the table decked with the evidences of Summer when the earth without is covered with ice and snow. Such things are always pleasing to the eye, even when the growth is not natural. A precocious child, however, seldom grows up into a valuable man.—*Jacobs.*

THE line of conduct chosen during the five years from fifteen to twenty, will, in almost every instance, determine the character for life. As a young man is then careful or careless, prudent or improvident, industrious or indolent, truthful or dissimulating, ignorant or intelligent, temperate or dissolute—so will he be in after years; and it needs no prophet to cast his horoscope or calculate his chances in life.

THINKING.—Thinking, not growth, makes perfect manhood. There are some who, though they have done growing, are still only boys. The constitution may be fixed, while the judgment is immature; the limbs may be strong, while the reasoning is feeble. Many who can run, and jump, and bear any fatigue, can not observe, can not examine, can not reason nor judge, contrive nor execute—they do not think.

Accustom yourself, then, to thinking. Set yourself to understand whatever you see or read. To run through a book is not a difficult task, nor is it a very profitable one. To understand a few pages only is far better than to read the whole, where mere reading it is all. If the work does not set you to thinking either you or the author must be very deficient.

It is only by thinking that a man can know himself. Yet all other knowledge without this is splendid ignorance. Not a glance merely, but much close examination will be requisite for the forming of a true opinion of your own powers. Ignorance and self-conceit always tend to make you overrate your personal ability—as a slight degree of knowledge may make a timid mind pass upon himself too humble a judgment. It is only by thinking, and much impartial observation,

Hygienic.

"Beverages."

BEVERAGES, so called, are tempters to the first steps towards drunkenness. At the appropriate seasons, the newspapers abound in receipts for making various kinds of summer drinks, wines, cordials, beers, and cider. There is no easier and more certain way of making a family of drunkards than by having such things always at hand, "in case of sickness," as it is termed. I know a man, my neighbor for many years, who was accustomed to "lay in" a barrel of cider every autumn, and it was placed on the table every day until exhausted; but every day it became more sour, alcoholic; and by the time it was out, the stimulus of it was so decided that a disagreeable want was experienced, and it was determined that next year he would lay in two barrels; at length six barrels were laid in for the winter's supply; meanwhile, my friend and neighbor had become a habitual drinker, on rising, at breakfast, at dinner, in the middle of the afternoon, and from supper until late bed-time; cider is too tame now; his position and means demand and supply the costliest brandies; he is seldom drunk, but always full; there does not live anywhere a more honorable and high-minded man; in all business transactions he has maintained the very highest position for incorruptible integrity, and as a neighbor and friend and good citizen, he has no superior; but take from him the brandy bottle for a day and he would go mad, or die of exhaustion—of an insufferable sinking.

It is an incontrovertible physiological fact, that any artificial stimulus continued for a few days, makes the system feel the want of it, instinctively lean upon it, and look for it; but this is not all: the same amount of stimulation is demanded every day; but to create that amount, a larger and an increasing quantity of the stimulus becomes necessary, or it must be more frequently supplied. No habitual user of spirits, or of tea and coffee, can possibly deny this, after ten years' practice; as proof, see how much oftener they drink or smok or chew than when they first entered on the miserable, useless and degrading career of self-judulgence. The truth is, there is no safety except in absolute retusal even to taste a drop or chew an atom. He who takes one drop may die in the gutter; he who has the high moral courage to refuse that first drop, that first atom, never can!

I know a whole family of beautiful grown-up daughters, not one of whom by any chance ever refuses, at home or at a party or on a picnic, to take a glass of brandy, toddy or any of its likes. The habit was formed by the mother making brandy the panacea for every stomach-ache, for nausea, for faintness, for bodily derangement, for a chill, for an overwork or an over-meal.—*Boston Watchman and Reflector.*

THE LIVER, weighing about four pounds, is the great wheel of life's machine; it regulates the whole mechanism of man; when it "acts," works well, every other wheel, gland, factory, works with it; when it stops, is "torpid," the whole system begins to get out of order; the feet become cold; the head aches; the mouth tastes bad; there are pains at the edges of the ribs; at the shoulder blades; on the tops of the shoulders; the body is chilly; the mind is confused; the spirits despondent; the disposition fretful, peevish and complaining; there is no ambition, no animation, no life; and if these things are allowed to go on, especially if moodiness is cherished and melancholy feelings are indulged in, the end is suicide. This unhappy state of mind and body is the result of what is called "biliousness," that is, the liver, whose office it is to withdraw the bile from the blood, fails to perform that duty, and the blood, having more and more bile in it, becomes more and more impure, thickens more and more, until at length it is almost too thick to flow at all; if this take place in the chest, it is called congestion of the lungs; if in the liver, congestion of the liver; if in the skull, congestion of the brain; if in the whole body, it is congestive fever, which generally means death. Some of these congestions may arise from other states than a disordered liver.

The bile is composed mainly of those waste portions of the human machine, which, having subserved their purpose, are not further needed, but require to be removed from the body; and in the wonderful wisdom and economy of the great Architect of our frame, and of all worlds, the very passing out of this waste is made to answer a purpose fundamentally essential to all human health; for, after having eaten a meal, the bile is conveyed into the intestinal canal, drop by drop, causing an action which results in the regular daily motion of the bowels, without which there can never be good health for forty-eight hours at a time; hence, "constipation" shows that the liver is not working healthfully, and remedies are required which "act upon the liver." There are two safe, unmedicinal modes of acting on the liver, of starting the machinery of life, when it tends to stand still: go to bed, wrap up warm, make hot applications to the feet, drink warm teas abundantly so as to cause profuse perspiration for two or three hours; a better plan is, go to work in the open air and keep at it, to the extent of exciting a gentle perspiration until tired or very hungry, for whatever starts perspiration on the skin starts the wheel of the liver to working, and the person gets well apace.—*Dr. Hall's Journal.*

DYSPEPSIA.—The most universal cause of dyspepsia is eating too often, too fast, and too much. The general rules should be:

1—Eat thrice a day.
2—Not an atom between meals.
3—Nothing after two o'clock but a piece of cold bread and butter and one cup of hot drink.
4—Spend half an hour at least in taking each meal.
5—Cut up all meats and hard food in pea-sized pieces.
6—Never eat enough to cause the slightest uncomfortable sensation afterward.
7—Never work or study hard within half an hour of eating.

The most universal and infallible indication that a person is becoming dyspeptic is some uncomfortable sensation coming on uniformly after each meal, whether that be in the stomach, throat or any where else. The formation of wind in the stomach, indicated by eructation, belchings, or otherwise, demonstrates that dyspepsia is fixing itself in the system. Then there is only one course to pursue, and that is infallible: eat less and less at each meal, until no wind is generated and no other uncomfortable sensation is experienced in any part of the body. No medicine ever cured confirmed dyspepsia; eating plain food regularly and living out of doors industriously, will cure most cases.—*Dr. Hall's Journal.*

TEA AND COFFEE.—The following result of an analysis of adulterated tea, which is given by Dr. Smith in his work on "Foods," is a fair illustration:

"Iron, plumbago, chalk, China clay, sand, Prussian blue, tumeric, indigo, starch, gypsum, catechu, gum, the leaves of the camella, savangua, *Chloranthus officinalis*, elm, oak, willow, poplar, elder, beech, hawthorne, and sloe."

It will be observed that in this sample there was not a single leaf of genuine tea, while there were two or three poisonous substances. Prussian blue contains a large proportion of prussic acid, one of the most deadly poisons known. Green and black tea are both made from the same plant, the only difference being in the mode of preparation. In general, the only difference is that a green tea is colored with Prussian blue. According to reliable authorities, the proportion of the poison used is *one grain* to every ounce of tea! How many thousands may have been the unsuspected victims of this wholesale poisoning. This mode of adulteration is exceedingly common with the Chinese in their preparation of tea for foreign markets. It is well known that they never use green tea themselves, on this account.

During the single month of July, 1872, 183,000,000 pounds of tea passed through the English custom house, of which 10,000,000 pounds were found so badly adulterated as to be entirely unsafe for use.

Here are a few of the diseases resulting from the use of tea, coffee, chocolate and similar beverages: Nervousness, sleeplessness, hypochondriasis, sick headache, insanity, tremens, convulsions, paralysis, insensibility, torpidity and congestion of the liver, vertigo, palpitation of the heart, tawny and torpid skin, consumption and other lung diseases, all sorts of nervous diseases, decay of the teeth, loss of sense of taste, constipation, diarrhea, hemorrhoids, dyspepsia, general muscular and nervous debility, epilepsy, cancer, and defective circulation.

Ask the tobacco-user, whose whole body is saturated with the filthy poison, if his nature makes any remonstrance to his daily use. He will tell you, No. Put the same question to the confirmed inebriate, and although his blood may contain so much alsohol as to be inflammable, he will tell you that it does him no harm. The user of tea will declare that the beverage is absolutely indispensable for the maintenance of his life; and the opium eater will declare that his daily dose of morphia "does him good."

Even the most inveterate user of either tea or coffee can cease its use at once without any fears of shortening his life by doing so, although he may feel as though death would certainly result. All his bad feelings are simply evidences of the injury which the tea and coffee have already done, and not of the necessity for their use, or of any injury resulting from abstaining from them. But when so sudden a change is made, the individual should make an exclusive business of it. Lay aside all cares and responsibilities. Do not attempt to pursue your usual avocations, at least, let only a very small proportion of the ordinary amount of work be done. Avoid anything taxing or unpleasant. Secure rest and quiet. If the head aches severely, and the nerves seem to be all unstrung, apply hot cloths to the head for a few minutes, take a tepid bath, and go to bed. A few days of persevering effort will end the struggle and give you the victory.

A less satisfactory plan is to gradually decrease the strength of the beverage and the frequency of its use until it can be relinquished without notice.—*Health Reformer.*

The deepest well in the world is in the village of Speremburg, twenty miles from Berlin, Prussia. It was bored by the German Government for a supply of rock-salt. Operations were commenced five years ago by sinking a shaft sixteen feet in diameter, and salt was reached at the depth of 287 feet. In order to find how thick the salt was, boring was commenced at a diameter of thirteen inches, to a depth of 960 feet farther, always boring into rock salt. Encouraged by this, a steam engine was erected, and the boring continued by its help until the present time, when a total depth of 4,194 feet has been attained, without having gone through the salt deposit, which is here at least 3,907 feet thick, while it it not known how much thicker it may yet be found to be.

The end of everything—The letter *g*.

that a man can discover his real disposition. A hasty temper only supposes itself properly alive; an indolent indulger imagines he is as active as any one; but by close and severe examination each may discover something nearer the truth.

Thinking is, indeed, the very germ of self-cultivation—the source from which all vital influence springs. Thinking will do much for an active mind, even in the absence of books, or living instructors. The reasoning faculty grows firm, expands, discerns its own power, acts with increasing facility, precision and extent, under all its privations. Where there is no privation, but every help from former thinkers, how much may we not expect from it! Thus great characters rise. While he who thinks little, though much he sees, can hardly call anything he has his own. He trades with borrowed capital, and is on the high road to literary, or rather to mental, bankruptcy.

How to Eat an Orange.

A correspondent of the *Home Journal* writes: Always on a Southern gentleman's table the dessert of oranges is furnished with small silver fruit-knives and spoons. The orange is held in a napkin—just as you hold an egg—and with the slender point of the knife a circular incision is carefully made made in the stem end of the orange, and the stem core is nicely cut out, leaving an orifice large enough for an egg-spoon. The orange is held and eaten then, just as gourmands eat an egg, in its own shell; and the skill and grace with which this is done—that is, without soiling the fingers or napkin—are, as in the same process with the egg, a test of good breeding. I have known the most inexpert person to master the few difficulties in the way after two or three efforts; and their satisfaction was an infinitely pleasant sight.

To the hostess who likes to have the table preserve in some degree, at the close of an entertainment, the beauty which dazzled the guests upon entering, this method is most desirable. Servants—let me put in a plea for those silent ones whose interests are two seldom regarded—are spared the tedious duty of gathering up the fragments; and guests who look with dismay at this tempting apple of the Hesperides, can thus enjoy it as they never did before. Only the delicious nectar of the fruit is eaten, with the more delicate pulp, the tough fibre—of which, indeed, there is very little in an orange plucked from the tree under its own skies—being left in the shell. I trust you will try this method, which we of the coast country along our Mississippi river think is the only elegant way to get at the heart of the matter. O, those dainty *dejeuners* of the past, with their fruit and flowers, and wit, and grace, and rippling laughter, in the fairest land that ever the skies bent over, our Beautiful, our Desolate.

What Might be Done.

The following is an extract from a speech of P. T. Barnum at Philadelphia:

I will undertake, and give bonds for the fulfillment of the contract, that if the city of Philadelphia will stop selling liquor and give me as much as was expended here for liquor last year, to run the city next year, I will pay all the city expenses (pause); no person living within her borders shall pay taxes (pause); there shall be no insurance on property (pause); a good dress and suit shall be given to every poor boy, girl, man and woman (pause); all the educational expenses shall be paid (pause); a barrel of flour shall be given to every needy and worthy person (sensation); and I will clear a half million or a million dollars myself by the operation! (cries of "hurrah!") It would be the best business speculation I was ever in. Unfortunately they wouldn't give it to me. As Benjamin Franklin said, "we are paying too dear for our whistle."

Boys and Girls.

Helping Papa and Mamma.

PLANTING the corn and potatoes,
Helping to scatter the seeds,
Feeding the hens and the chickens,
Freeing the garden from weeds,
Driving the cows to the pasture,
Feeding the horse in the stall—
We little children are busy;
Sure, there is work for us all,
Helping papa.

Spreading the hay in the sunshine,
Raking it up when 't is dry,
Picking the apples and peaches
Down in the orchard hard by,
Picking the grapes in the vineyard,
Gathering nuts in the Fall—
We little children are busy:
Yes, there is work for us all,
Helping papa.

Sweeping, and washing the dishes,
Bringing the wood from the shed,
Ironing, sewing, and knitting,
Helping to make up the bed,
Taking good care of the baby,
Watching her lest she should fall—
We little children are busy;
O, there is work for us all,
Helping mamma.

Work makes us cheerful and happy,
Makes us both active and strong;
Play we enjoy all the better
When we have labored so long,
Gladly we help our kind parents,
Quickly we come at their call;
Children should love to be busy;
There is much work for us all,
Helping papa and mamma.

A True Hero.

A boy about nine years old was bathing one day, when, by some mistake, he got into deep water and began to sink. His elder brother saw him, and ran to save him, but lacking strength or skill, he also sank to the bottom of the river. As the two drowning brothers rose to the surface for the last time, they saw a third brother, the youngest of the family, running down the bank for the purpose of trying to save them. Then it was that the nine-year-old acted the part of a hero. Struggling as he was with death, he gathered all his strength, and cried to his brother on the shore, "Don't come in, or father will lose all his boys at once!"

Noble little fellow! Though dying, he forgot himself, and thought only of his father's grief. He was a genuine hero. His brother obeyed his dying command, and was spared to comfort his father when his two dead sons were taken from the river clasped in each others arms.

Mary was the proprietress of a diminutive, incipient sheep, whose outer covering was as devoid of color as congealed vapor, and to all localities to which Mary perambulated, her young Southdown was morally certain to follow. It tagged her to the dispensatory of learning, during a natural section of time, which was contrary to all precedent, and excited the cachinnation of the seminary attendants, when the children perceived the presence of the young quadruped at the establishment of instruction. Consequently, the preceptor expelled him from the interior, but he continued to remain in the immediate vicinity, and tarried in the neighborhood without fretfulness until Mary once more became visible.

"Mother, mother," cried a young rook, returning hurriedly from its first flight, "I'm so frightened! I've seen such a sight!" "What sight, my son?" asked the rook. "Oh! white creatures, screaming and running, straining their necks, and holding their heads ever so high. See, mother, there they go!" "Geese, my son; merely geese," calmly replied the sapient parent bird. "Through life, child, observe, that when you meet any one who makes a great fuss about himself, and tries to lift his head higher than the rest of the world, you may set him down at once to be a goose."

The Pineapple.

The history of the pineapple dates back for three or four centuries. Columbus found it on the Island of Guadalupe in 1492. The Japanese cultivated it as early as 1590, and it is supposed that it was first brought to Europe from Jaua. It appears that this fruit was transplanted from South America to Asia and Africa; for, in 1592, it was carried to Bengal and China from that country. It thrived in Brazil, and, according to Humboldt, grows wild in the forest of Orinoco. They spoil very easily, and sometimes during the voyage here the whole cargo of a vessel is spoiled. It is considered a good trip if three-fourths of a cargo is in good condition when the vessel arrives. This depends not only on the length of the voyage, but also upon the bad weather experienced, thunder showers being particularly destructive to them. It is estimated that four million two hundred thousand pineapples are brought into New York annually. The business of canning this fruit is becoming quite extensive, and likewise profitable, and several firms are engaged in this preparation, and they put up at least a million pineapples in cans every year.

Treatment of Animals and Implements on the Farm.—Is not the following as applicable to California as to the South? If a southern farmer wants a wagon he buys it where best he can—most likely through some dry goods merchant, who secures the sale by exhibiting to the inquiring farmer a beautiful chromo, painted with all the colors of the rainbow. The vehicle is bought at the cost of a hundred dollars or more, possibly on a credit with fifty per cent. profit to the vendor, and finally reaches home as pretty as a picture. Left in the horse-lot on its arrival, there it stands, subject to winter's rains or summer's suns, except when in use, until every vestige of paint has scaled off, nuts and bands become loose, and wheels so rickety that the running gear can scarcely sustain itself, when the owner pronounces the manufacturer a cheat and his wagon "no account." The same vehicle, kept closely housed at all times, day and night, except when in actual use, would last almost a life-time and look fresh until it is worn out.

But to shelter these vehicles would require the building of sheds, and building sheds necessitates spending money, and money is the very thing we farmers do not have. This is the excuse of many farmers who have no shelter for vehicles on their farms, and not very desirable stables or houses for their stock in most cases. But it is an excuse without reason, for there is not a farmer in the South who cannot, by his own labor, free of the expenditure of a dime, build a shed that would shelter his implements from the weather.

The ploughs, that might be secured somewhere under shelter, are seldom brought nearer than a fence corner in the lot and there left until the next time they are needed, if it should not be for six months.—*Rural Carolinian for April.*

The Pacific Jockey Club of San Francisco offer a purse of $30,000 at their November meeting, for a four-mile-and-repeat race—$15,000 to the first horse, $6,000 to the second, $5,000 to the third, and $4,000 to the fourth. It seems that when there is so much money to spend in stimulating the breeding of race horses, our agricultural societies ought to do something to encourage the raising of farm and draft stock. If the sums above mentioned were offered to the men who in five years from this time would exhibst the best home-bred farm horse, we doubt not the result would be beneficial to the State—*Semi-Tropical Farmer.*

"Do you like codfish balls, Mr. Wiggins?" Mr. Wiggins, hesitatingly—"I really don't know; I don't recollect attending one."

SPROUT PRUNING.

We desire to say a word to orchardists, and all others, about suckering fruit trees. It is a common practice for persons in summer to go about amongst their trees and cut or break off the sprouts and suckers that are growing out where limbs are not wanted to grow. Now we expostulate. We say don't do it. It is not the right season to trim foliage from the trees, and it cannot be done without injury to the vitality of the tree. This is particularly the case with trees that have been heavily pruned, or that were grafted last spring or this year before. Such trees are most likely to throw out a good many shoots from the trunk and limbs, and because such shoots are not wanted to make limbs they are ruthlessly cut away. Our reasons, founded on experience and the most careful observation, are these: The tree needs leaves to absorb nutriment from the air and assimulate the same, induce a healthy circulation of the sap, shade the limbs and trunk of the tree, etc., all very important offices to the life, health and value of the tree. Nature puts out these shoots from such parts of the tree as are most likely to produce healthy leaves which can most perfectly perform this office. The *waste* in growing these shoots is very little compared with the *gain* through them to the rich juices that sustain the tree in vigor and growth.

Where you think that these suckers are "sapping," as the saying is, the life from your scions, nip off the outer ends of the suckers only. By checking their rapid growth the sap will naturally flow into such scions or limbs as have not been molested and make them more vigorous; when if you cut away the suckers the sap of the whole tree becomes in a measure stagnated, and an imperfect digestion is sure to follow. "Sour sap," with limbs exposed to the sun, will kill the limbs, and no tree can be deprived of its leaves, or any portion of them, at this season, without suffering proportionately.

Next winter and spring you can cut away whatever growth is out of place or not wanted with comparative impunity. The tree is then at rest, the starch and sugar now being formed and absorbed through the leaves are then held in store in its vital juices. The buds left on the tree next spring will be thrown into action to make new shoots and leaves. Healthy, strong, vigorous roots to a tree are of as much, or more importance than a good top. To keep the roots vigorous, a full top during the growing season is necessary. There is nothing vicious in suckers growing. It shows that a new stock of healthy leaves is needed to keep up an active circulating of the sap—that nature is true to herself, and responds to the call where a balance of power is needed.

Our advice is to the point: You may nip back the suckers that seem to detract from the growth of other limbs or of scions, but don't remove them until after the fall of the leaf. Next winter, during pruning season, cut away all surplus growth not wanted It is never safe to remove large suckers from the tree during the growing season, unless there is a great abundance of limbs and leaves on the tree to give breath, draw nutrition and give vigorous circulation to the vitality of the tree.

PUBLICATIONS.

Hints and Helps in Our Temperance Work.

This is a pamphlet of seventy-two pages, prepared by Miss Frances E. Willard, Corresponding Secretary of the Woman's National Christian Temperance Union, containing full constitutions and plan of work for every department of woman's Christian temperance work, State county and local unions, juvenile societies, etc., full of important hints and suggestions, making a valuable hand-book for all. Send 25 cents for this book, and you will always think it money well invested. Address J. N. Stearns, publishing agent, 58 Reade street, New York.

The Science of Health

For July commences volume seven of this vigorous, active, and most instructive monthly. Its contents are more than usually diversified; opening with an interesting sketch and fine portrait of the late lamented publisher, Mr. S. R. Wells, the interest is well sustained throughout. It is filled with excellent articles on health subjects. The recipes of the department of Household and Agriculture are unusually full. Take it altogether it is a capital specimen number of that sort of literature which the masses of the people need to read. Price 20 cents. By the year, $2. An excellent premium is offered to those who subscribe for the year. Address, S. R. Wells & Co., 737 Broadway, New York city.

The Phrenological Journal,

Published by the above firm, $3 a year, is one of the best publications in America, filled with rational, intellectual food. Mrs. Charlotte Fowler Wells is now conducting the business of her late husband, and these publications must continue to be as entertaining as heretofore.

"Wide Awake."

The first number of a beautiful illustrated children's magazine, *Wide Awake*, is on our table. It is edited by Ella Farman and published by D. Lothrop & Co., Boston, Mass. $2 a year. A glance through it shows us a splendid assortment of rational, original matter, just to suit boys and girls, tinted pages and lots of nice pictures in highest style of the art. Send 20 cents for a specimen number.

"Sunshine,"

Is our favorite magazine for the little ones. No clap-trap, wishy-washy trash in it, but pretty stories, pictures and other interesting matters that are worth reading because they entertain and have some point to them. This little waif is published at Santa Clara by two good-looking school-marms, and is only $1 10 a year, postage paid. Address "Sunshine," Santa Clara.

We are under compliments to A. L. Bancroft & Co., San Francisco, for a pink-covered novel entitled "The Woman of Fire," by Adolphe Belcit, translated from the French. Now, we know nothing about the author, and don't care a fig for the contents, but by a glance through it we see it is a sort of sentimental love story. Of course, it was very considerate of B. & Co. to send us this novel to read during the hot weather, but we wish that when they send us another book to be noticed they would send something worth noticing, worth reading, and something that we can recommend on its own merits to our readers. To grass with all such trash as this. The world is full of it, and none the better for it either.

Meal-Feeding and Animal Digestion,

By L. W. Miller, Stockton, New York is the title of a little book published by request of the American Dairymen's Association. Price, 25 cents. This little work will be found valuable to all dairymen and others who feed grain, ground or whole, to animals. Inclose 25 cents to the author as above.

The Statistician

Is a monthly publication containing all sorts of statistics, such as cannot be found anywhere else. Get a copy at the news-stand, examine it, and then subscribe.

"Do you like codfish balls, Mr. Wiggins?" Mr. Wiggins, hesitatingly—"I really don't know; I don't recollect attending one."

A Standard Temperance Prize Essay.

TO THE FRIENDS OF TEMPERANCE.

The Committee appointed by the National Temperance Convention, held at Saratoga, in 1873, on the subject of a Standard Temperance Work, decided to divide the work into three parts, and to offer Two Prizes for each of the three essays, to be open to all writers who choose to compete therefor, in this and other countries:

1. The Scientific; embracing the Chemical, Physiological, and Medical aspects.

2. The Historical, Statistical, Economical, and Political.

3. The Social, Educational, and Religious.

The fund at command, through the efforts of Job H. Jackson, of West Grove, Chester county, Pa., enabled the Committee to offer one year ago Prizes of $500 and $300 for accepted manuscripts for Part I, and the responses of writers, now under examination, lead the Committee to hope for a work of value commensurate with the great cause it is expected to promote. This encouragement and the fund at command, and personal guarantee of Mr. Jackson, now further enables the Committee to announce Two Prizes for Part II—the Historical, Statistical, Economical and Political, and Two Prizes for Part III, embracing the Social, Educational and Religious relations of Temperance; viz.: For the best essay for each of these parts, adjudged satisfactory, the sum of $500 will be paid; for the second best essay, the sum of $300 will be paid—accepted manuscripts to become the property of the National Temperance Society.

The offers for Part II and Part III will remain open to all competitors one year, till July 1, 1876. Manuscripts (with the names and addresses of the writers by whom they are forwarded for competition, enclosed in separate sealed envelopes, not to be opened till after the award has been made) should be forwarded to A. M. Powell, 58 Reade street, New York.

The essays should be of such a character that, while adapted in style to interest the general reader, they will also meet the demands of scholarly criticism.

Those who intend to compete for the prizes offered for these essays, and who may desire more information as to the scope of the work and suggested subdivisions, will be furnished with further particulars by applying to Mr. Powell, as above.

In order that the complete standard Work may be placed before the public at the earliest practicable day, the Committee urgently appeal to friends of temperance to promptly supply them with funds to meet the prizes announced and to publish the work. The sum of $500, at least, additional to that on hand, will be required. Contributions may be sent to Job H. Jackson, Treasurer, West Grove Chester county, Pa.; to J. N. Stearns, Publishing Agent of the National Temperance Society, 58 Reade street, New York, or to any member of the Committee.

A. M. Powell,
James Black,
R. C. Vitman,
A. A. Miner,
Neal Dow,
} Committee.

58 Reade st., New York, March, 1875.

HOW TO PAINT,

A New Work by a **Practical Painter,** designed for the use of **Tradesmen, Mechanics, Merchants, Farmers,** and as a Guide to **Professional Painters.** Containing a plain, common sense statement of the methods employed by Painters to produce satisfactory results in **Plain** and **Fancy Painting** of every description, including **Formulas for Mixing Paint in Oil or Water,** Tools required, etc. This is just the Book needed by any person having anything to paint, and makes **"every Man his own Painter."**

Full Directions for using **White Lead, Lamp-Black, Ivory Black, Prussian Blue, Ultra-Marine, Green, Yellow, Vermilion, Brown, Lake, Carmine, Whiting, Glue, Pumice Stone, Asphaltum and Spirits of Turpentine, Oils, Varnishes, Furniture Varnish, Milk Paint, Preparing Kalsomine,**

PAINT FOR OUT-BUILDINGS,

Whitewash, Paste for Paper-Hanging, Graining in Oak, Maple, Mahogany, Rosewood, Black Walnut; Hanging Paper, Staining, Gilding, Bronzing, Transferring Decalcomania, Making Rustic Pictures, Painting Flower-Stand, Mahogany Polish, Rosewood Polish, Varnishing Furniture, Waxing Furniture, Cleaning Paint,

PAINT FOR FARMING TOOLS,

for Machinery, and for Household Fixtures.

TO PAINT A FARM WAGON,

to Re-varnish a Carriage, to make **Plaster Casts.** The work is neatly printed, with illustrations wherever they can serve to make the subject plainer, and it will save many times its cost yearly. Every family should possess a copy. Price by mail, post-paid, **$1.** Address

Mr. STUYVESANT,
Of Edgewood, Poughkeepsie, New York, wishing to increase his Short-horn herd of cattle, offers for sale is entire herd of
AYRSHIRE CATTLE,
Containing Twenty-five Cows in milk and in calf to
"ROBBIE BRUCE,"
Undoubtedly the finest Ayrshire bull in the country; four Heifers, due to calf by the same Bull during the Summer; seven Heifer Calves, sapped this Spring; four Bull Calves of this Spring; one yearling Bull, and the Bull ROBBIE BRUCE. This entire herd will be sold for the sum of **$8,000.**

This herd is composed of the two entire herds formerly belonging to Mr. W. Birnie of Springfield Mass., and Mr. H. S. Collins, Collinsville, Conn. Mr. Stuyvesant having some years since bought these two entire herds, and having had a weeding out sale last fall. The above stock is now recorded in Mr. Bagg's Canadian and American Ayrshire Herd Book. Mr. Stuyvesant, however, will agree to record all this stock either in the new volume to be issued by the Ayrshire Breeders' Association, or in Messrs. Sturtevant's new work called "North American Ayrshire Register," or in both, to suit the buyer.

Mr. Stuyvesant was awarded the HERD PRIZE at the New York State Fair at Rochester, last Fall, with large competition.

THE PEDIGREES
of this stock are all good. Catalogues containing a description of the herd will be sent on application. Also, catalogue of the small but value herd of Shorthorns at Edgewood written out on application.
Address, JNO. R. STUYVESANT,

AND

LIVE STOCK JOURNAL.

Vol. 6. San Jose, Cal., August, 1875. No. 8.

A WHITE MAN'S SOCIETY.

We attended a business meeting of the Santa Clara Valley Agricultural Society on 10th ult., and took some notes of proceedings. Mr. A. C. Erkson—an annual member who had paid his fees in advance and was a voting member when a previous meeting passed an order allowing only life members to vote, and which changed the constitution so that annual members cannot vote—was present, and put in an objection, and claimed the right to vote as he had been a voter previous to the change. He would not be disfranchised without contesting his right. After considerable argument, the President decided that he should be allowed to vote this season.

Mr. E. then moved to strike out the word "life" in the constitution, so as to allow all annual members to vote. He regarded it as a serious wrong against the farmers and mechanics who mainly support the Society—men who cannot afford to pay $50 at once, but have freely paid their $5 a year into the Society. He declared that no man with self-respect could hereafter patronize the Society as an annual member, unless the constitution was changed back so that annual members can vote and take part in the proceedings. The imputation that had been made against this class, that they would endanger the property and prospects of the Society if allowed to vote on business matters, Mr. E. thought very unjust. The grounds belonging to the Society have been largely paid for by annual members. He had paid more money into the treasury himself than many $25 or $50 members, who never pay but once.

Mr. C. T. Settle, who had voted to insert "life," now opposed it also. He had talked with a good many interested people, and found that it would not do to make this Society a close corporation. An imputation that the votes could be bought up he thought would apply as justly to inside or life members as to annual members. He did not want to compel outside members to look upon this Society as a "ring."

Col. Younger, Carey Peebles, and J. R. Weller insisted that none but life members should be allowed to vote at their business meetings. Reasons as follows: Their valuable grounds might be endangered if any one by paying $5 could vote on any proposition. Designing persons could bring in votes enough to carry any measure. They had worked hard and long for the good of the Society, without one cent of pay, and would guard their trust with every restriction possible. They meant no injustice or disrespect to honest annual members. Until this question was broached, no annual member had attempted to exercise the franchise in the meetings. They cannot afford to risk this property to satisfy a clamor now. The community should be disabused, and not blame them. The doors were open to life members. They desired the community generally to take an interest in their affairs, etc.

Putting the matter to a vote, it stood 11 to 4 against permitting annual members to vote.

Mr. Erkson then wished the constitution so amended that any member outside of Santa Clara county can hold office in the Society. Killed—11 to 4.

Mr. E., who said that he would do all he could to "purify" the Society, then proposed striking out the word WHITE where it reads, "any white person can become a life member member by paying $50," etc. Voted down—11 to 4.

The same gentleman then moved to strike out the word WHITE as applied to annual memberships. Lost again, although some of the dissenters said they should be willing for the darkeys to buy tickets and attend the fair.

We will not append any remarks of our own, but leave our report of this white man's agricultural horse-trotting society to the discretion of the public.

EFFECT OF LAST SPRING FROST.

The high price of fruits this season is something unprecedented, if we except the times when orchards were scarce. The early reports of prospects for short crops were not overdrawn. Even the blackberries that bloomed after the spring frosts are very short indeed. Several patches near San Jose have failed entirely. Others have not produced one-tenth of a crop. For instance, Mr. Bird's eight acres, that produced seventy chests per day last year for weeks together, is yielding only five chests per day this season. The San Jose Canning Factory contracted for all that several vineyards produce at 6 and 7 cents. Last year they got all they wanted for 2 cents. The crop is so short that dealers have to pay nine cents by the chest, and many orders from a distance cannot be filled. The local demand is greater than the supply. As to other fruits the San Francisco markets govern ours, and much of the fruit used in San Jose is shipped from a distance. On an average, it sells for less in San Francisco than in San Jose, notwithstanding that San Jose is one of the finest fruit growing districts in the State.

It is wonderful how much time will be coosumed daily on a farm in doing a few chores. To sit down and make a calculation, after knowing just what one has got to do, it would be easy to condense into one hour what it will take two to three hours "to get round to." We have undertaken a job of this kind this season, for "fun," of course. We find by timing it that we can milk four cows in thirty minutes. It don't take us longer to drive the cows up, water them, feed the pigs, "put the chickens to roost," or do any other separate thing than any other person would use, yet we can manage to worry out some four hours daily, on an average, choring around, getting wood, water, milking, making butter, etc., and doing what seems necessary to be done in choring on a farm.

A man's surroundings, says Mr. Colman of the *Rural World*, are a very fair indication of his character. A home surrounded by a dilapidated fence, part rail and part plank; the posts propped up to hold the frail concern in anything like an upright position; the few old peach trees in the front yard leaning over the fence; the lawn decorated with Jamestown, dock and iron weeds—presents a sorry sight when placed in contrast with a home surrounded by a neat, upright fence, a gate well hung, and the yard planted with (it may be) a few well grown, thrifty looking peach trees; while scattered here and there are a few conifers or evergreens, a few flowering shrubs in clumps, and one or two flower beds or borders; the lawn covered with blue grass and kept in a trim and neat condition; the walks free from weeds, and raised well in the center so as not to necessitate the use of planks for walking on in muddy weather.

"He is an enemy of the State who desires more land than he himself can use," was a motto of Rome in the days of her greatest advancement and prosperity. Slavery and land monopoly was at last her ruin, and caused the downfall of the most powerful civilization of ancient times, by depleting the population and destroying the patriotism of the people who became homeless and dependent, and corrupting the rest.

Home is the foundation of freedom, patriotism and country. Land monopoly is one of the greatest curses that the world has ever seen. There is danger that our country may yet fall beneath its terrible power. There is no State in the Union more cursed by fraudulent land transactions than is California. Abused law and rascally lawyers have accomplished for designing villains what force could never have undertaken. The people have tamely submitted, and land monopolists are even respected. We hope the time will soon come when such men cannot hold offices of trust in the gift of the people.

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

We are glad to note, in the interests of producers, that the price of wheat has advanced very materially. We believe that the raise is a healthy one and must continue until another season.

A report from Kansas says that alfalfa has been fully proved to be as valuable in that State for forage as in California. Neither drouth nor grasshoppers kill it. It looks luxuriant and is considered to be the best grass for Kansas.

Uncle Ben acknowledges the receipt of two letters from our little readers, but not in season for the Boys' and Girls' department this month. Next month he promises to give the children a nice treat, and hopes every boy and girl who ever reads the AGRICULTURIST will send him a letter. Cannot the fathers and mothers encourage them to do it? He wants lots of letters, so that he can always make up a department for boys and girls worth reading—an original one, alive and as spicy as a nutmeg.

It is a safe policy to always sell grain and hay when it commands a price a little above an average, and generally safe to hold onto these products when prices are low, for a raise. Those who hold for a big thing generally lose, while to sell at a very low price is not a sound financial transaction. The farmer who is not a little sharp in such legitimate matters is sure to be taken advantage of by somebody. We are often asked for advice. Our answer must always be, watch the markets as reported in daily and weekly papers; depend upon your own and your good neighbor's judgment.

Mr. Wm. Landrum, of Watsonville, recently passed through San Jose, on his way to Oregon with a lot of his pure-bred Angora goats. Oregon promises to be a fine country for these animals, and there bids fair to be a lively demand for all the California breeders can spare from their flocks.

Pro-per Wheat.—This is a variety of bearded wheat which has this season yielded on dry soil at least one-third more than the Australian and Sonora beardless varieties. This is the experience on Mr. A. Woodham's farm, near Santa Clara, this season, and the beardless wheat had the advantage of earliest sowing, too. Another thing in favor of the bearded wheat is this, it will not thresh out in the field by the wind, as the beards protect the heads from striking sharply together.

Col. Younger thinks we did his stock an injustice last month in the article about Mr. Clark's farm. We did not intend to, and are willing to make such correction as may be proper. The Col. has been breeding for fine form, and has taken more first premiums at state and county fairs for fine cattle than any other man in this State. In every fine herd there will be some animal not so fine as the rest. Mr. Clark's Younger cow was purchased second-handed, and is not by any means equal to his average run of stock. Col. Younger has lately sold a yearling bull of his Short-horn stock for $500, and a heifer and two young bulls for $900.

The Domestic Department, this month, will be found unusually attractive. A frank acknowledgment on the part of a correspondent last month that she had poor success in making bread has "brought down the house." We wonder if the out-of-doors farmers would be so ready to help a fellow out of trouble if he would acknowledge that he did not meet with success in any particular branch of his farm labors? We honor those who are not afraid to ask for advice. We know that there are many farmers who are lacking in best practical methods and application in important matters, and we have traveled enough to know that good cooking among farmers' wives is as often the exception as the rule. An ambition to improve is always commendable.

A good quality of butter depends quite as much upon a good quality of feed for the cows as a good quality of pork does upon the feed the swine has to eat. The best butter is not made from either the greenest grass nor from dry feed, but is made when green feed is rich in nutritious matter, say about the time of blossom and before the seed is shattered out. Dry feed of good quality like good wheat stubble, will make butter that will keep well, but it has not the "grain" of butter made on greener feed. Alfalfa will make good butter the year round. Cows running in stubble fields should have roots or some green feed if you desire the butter to be first class and of good color. It will pay any dairyman to so plan it that he can have dry feed for his cows once a day when feed is green, to give the butter substance, and green feed when pastures are dry, to give texture and color to the butter.

Political corruption has it root in, and draws its main support from the corrupt newspaper press—a press that can be subsidised by central committees and candidates for office. An agreement to advocate the interests of any man or party carries an obligation to oppose the opposite man or party. The editor who is subsidised is hardly capable of expressing an honest opinion, and is surely not to be trusted. He gains the confidence of the people by subterfuge, to carry out the schemes of dishonesty, claiming at the same time to be working in the interests of the people. He is paid to deceive. The politician who pays him does so hoping for a chance to get even when he gets into office. He who subsidises can be subsidised; and the subsidised editor is paid to cover up as well as to support. Honest politicians and honest papers are so scarce that we know not where to point one out.

The remedy for political corruption is in a system that will drive out bad men by ceasing to offer inducements to them to seek office, and that will at the same time offer inducements to honest, patriotic and philanthropic persons to accept offices of trust and duty. A strictly conscienciens man cannot consent to be assessed to pay whisky bills and lying newspapers, but would be willing to do what he could for the public good for a workingman's wages at any time. The unscrupulous politician seeks office for the *pay* it promises, and the more pay there is in it, really and prospectively, the more corruption funds he will dispense to obtain office. If our premises are correct, then to reduce the salaries of public servants to the standard of wages earned by the industrious farmer and mechanic will be expedient. One temptation to use corrupt means to obtain office will be destroyed. Monopolists may still endeavor to elect men to further their ends, but even their Sampson will be shorn of his strongest locks.

Our lady readers who are fond of flowers (and who of them are not?) will find it policy to sow seeds of perennial plants either this month or next, and have their plants blossom next year. Pinks, Sweet Williams, Stocks, Wall Flowers, Columbines, Snap-dragons, Hollyhocks, Hibiscus Penstemon, Lark Spurs, Daisies, Garden Rocket, Cannas, Four O'clocks, Campannlas, Foxgloves, Shrubby Cypress, Oswego Tea, Polyanthus, etc. It is best to plant in boxes. A peach box six inches deep, with four inches of fine soil in it, on which to place the seeds, then cover the seed one-half inch with sand, is a good thing to use. Set the box out of the wind and where the sun will not strike it during the heat of the day. Keep the soil constantly moist by watering until the plants are up and growing nicely. When the first winter rains wet the soil you can transplant into the garden if you choose; or, if the seeds come up thickly, transplant sooner into some favorable place. By a little pains, in our favored climate, you can have all these perennial plants in beautiful condition to blosson early another year.

The coming woman—Annie Versary.

Poetry.

Straw Stacks.

BY KATE A. M. RAMSAY.

THE leafy bowers are sung of, and the seats 'neath the primrose hedge,
And the seats by the shady maple, and the nooks by the water's edge.
There are lines to the vine-clad arbor—cool refuge of summer time;
But the charms of a cheerful straw stack I never saw in rhyme.

Sometimes I chance upon one, in my plodding, rural way,
And am truly, surely tempted to indefinite delay,
And seeking its sunny corner, I build my castles there,
Those well-known, royal structures that disappear in air.

I dream of joy and sweetness; all hard paths fade away,
And only my hope and the sunshine illuminate the day.
Then, wooed by the brooding quiet, I count my blessings o'er,
While the blue, soft sky entreats me to think of clouds no more.

I fashion plans for the future, where I'll get a new book every week,
And tickets for concerts and lectures whenever I choose to speak.
I muse o'er my sometime travels, when "my ship comes over the sea,"
And visions of Rome and Paris in my journeyings come to me.

I shall see the Vatican famous, and behold the world renowned toe
Of Pius now reigning so widely—infallible man, you know
I imagine I see St. Peter's, and standing awe-struck 'neath the dome,
I wonder if it is a cathedral, and I am at last in Rome.

In "merry England" and Scotland, in Ireland, too, I must roam,
Going over the bogs and marshes, to kiss the "blarney stone."
Just here my thoughts are scattered. Blue-eyed brother Ben finds me out;
A picture of brown-faced wonder, he says, "What are you about?

"I've hunted and hunted an hour, and can't find any fish-line;
I want to go fishing with Charley, and ma says it's tea-kettle time."
I rise up and leave quite reluctant, but my feeling of unrest has flown.
And richer I feel for that hour spent by the big straw stack alone.

Modern Ethics.

BY HELEN E. CLINTON.

It may be sound philosophy,
As pertinent as brief,
To name a man a financier
Who should be called a thief.

It may be a Christian charity,
That looks with lenient eyes,
And says a man exaggerates,
When I should say, "He lies."

It be modern purity
To say a man is "fast,"
Who drags his victim down to death,
Then prates of follies past.

It may be modern justice true
That hurls her to the ground;
I'd hold the trembling creature up,
And strike the scoundrel down.

Labor.

Toil swings the ax and forests bow;
The seeds break our in radiant bloom;
Rich harvests smile behind the plow,
And cities cluster round the loom.
Where towering domes and tapering spires
Adorn the vale and crown the hill—
Stout labor lights his beacon fires
And plumes with smoke the forge and mill.

The monarch oak, the woodland's pride,
Whose trunk is seamed with lightning scars,
Toil launches on the restless tide
And there unrolls the flag of stars;
The engine, with its huge of flame,
And ribs of brass and joints of steel,
From Labor's plastic fingers came,
With sobbing valve and whirling wheel.

Here sun-browned toil with shining space
Links lake to lake with silver ties,
Strung thick with palaces of trade
And temples towering to the skies.
'Tis labor wores the magic press
And turns the crank in hives of toil,
And beckons angels down to bless
Industrious hands on seas and soil.

Keep the Heart Light as You Can.

BY CHARLES SWAIN.

We have always enough to bear,
We have always something to do;
We have never to seek for care,
When we have the world to get through.
But what though adversity's test
The courage and vigor of man,
They get through misfortune the best
Who keep the heart light as they can.
Though there's always enough to bear,
There is always a something to do;
We have never to seek for care
When we have the world to get through.

If we shake not the load from the mind,
Our energy's sure to be gone;
We must wrestle with care, or we'll find
Two loads are less easy than one.
To sit in disconsolate mood
Is a poor and a profitless plan;
The true heart is never subdued
If we keep it as light as we can.
Though there's always enough to bear,
There is always a something to do;
We have never to seek for care
When we have the world to get through.

There's nothing that sorrow can yield,
Excepting a harvest of pain;
Far better to seek fortune's field,
And till it and plow it again.
The weight that exertion can move,
The gloom that decision may span,
The manhood within us but prove;
Then keep the heart light as you can.
Though there's always enough to bear,
There is always a something to do;
We have never to seek for care
When we have the world to get through.

Follow Up the Plow.

BY WILL S. HAYS.

Hard times are now upon us,
And the people are in debt;
The country's full of trouble,
And the worst is coming yet.
'Tis but without its causes,
And we'll plainly tell you now,
The only way to stop it
Is to follow up the plow.

Chorus— Then follow up the ploy, boys,
Follow up the plow;
If you would build the country up,
Just follow up the plow.
Then follow up the ploy, boys,
Follow up the plow;
If you would build the country up,
Just follow up the plow.

Fill up your fields and prairies
With a crop that's "good as gold,"
And mine your hills and valleys wide,
For iron, salt and coal.
The earth is the producer,
And she can tell you how
To make a princely fortune—
'Tis to follow up the plow. Chorus.

There are too many people
Who from their duty sh rk,
Who'd rather make a fortune
By some other means than work.
The man who plants potatoes
Corn, wheat or cotton now,
Is king among the "moneyed men:"
He follows up the plow. Chorus.

Farmer's Song.

'Tis writ in records of the past,
And all the days of yore,
It will be in the present time,
Till time shall be no more,
That all the wealth, and power, and might,
Attained by human hand,
Is taken from, and built upon,
The precious, fruitful land.

Realms and nations now are built;
Great scepters, thrones and crowns,
Gigantic cities, towering high,
And o'er the earth fair towns;
But from their lofty hight could be
To desolation hurled,
Did we but stretch our hands on high,
And cease to feed the world.

The vaunted hight that idlers gain,
Proud rulers of the land;
Who wield the might of armies, too,
Which move at their command;
They fain look down on us, we see,
The proud lip then is curled,
Think not, proud lord, we'll serve you long;
'Tis we who feed the world!

The low shall learn their power in time,
That thrones are useless things,
And crowns of honor by and by,
We'll give our real kings;
'Tis those who feed, and those who teach,
Who then shall rule the land,
And rulers then, in that good time,
Shall move at our command!

—[Western Rural.

Sow to Reap.

Ever so little the seed may be,
Ever so little the hand;
But when it is sown it must grow, you see,
And develop its nature, weed, flower or tree;
The sunshine, the air and the dew are free,
At its command.

If the seed be good, we rejoice in hope
Of the harvest it will yield.
We wait and watch its springing up,
Admire its growth and count on its crop,
That will come from the little seeds we drop
In the great wide field.

But if we heedlessly scatter wide
Seeds we happen to find,
We care not for culture or what may betide,
We sow here and there on the highway side,
Whether they've lived or whether they've died,
We never mind.

Yet every sower must one day reap
Fruit from the seed he has sown;
How carefully then it becomes us to keep
A watchful eye on the seed, and seek
To sow what is good, that we may not weep,
To receive our own.

The Sower.

BY D. W. C. PACCARD.

Sow, farmer, sow, for the seeding time is here,
Plant for the future and sow for the year,
But weed out the thistle, and root up the thorn,
Make room for the apple, the wheat and the corn.

With foot on the spade, and with hand on the plow,
With grime on the palm, and with sweat on the brow,
Press onward, brave yeoman—thy vessal shall be
All green earth that stretches betwixt sea and sea.

The roll of the thunder, the best of the rain,
The wind of the mountain, the breath of the plain,
The shimmer of moonlight—the dew, and the sun—
Shall aid thee and cheer thee till Harvest is won.

Move on to the front, then, with shovel and hoe—
The coro field shall rustle—the hillside shall glow—
And Plenty and Peace shall abide in the land
Which Labor hath conquered and Freedom hath planned.

Centinela Orange Grove.

The Los Angeles *Express* of June 11th says: It probably is not generally known, but this young grove will be the largest orange orchard in one inclosure in the world. It covers nearly three hundred acres of the choicest land in the Centinela valley, and contains some 13,000 orange trees nearly five years old. Planted between the rows are some 2,500 almond trees, now three years old. The almonds will bear this year, and will yield about six pounds per tree. In two years they will easily yield twelve pounds per tree, or $6,000. Two thousand lime trees four years old, are in this orchard, and they will in two years yield $5 per tree, or $10,000. The almonds will be dug up as soon as the oranges begin bearing. In the meantime, they will pay the entire expense of attending to the orchard. The orange trees will commence bearing in five years. Two years later it is reasonable to suppose they will yield 1,000 oranges to the tree, which at one cent apiece, would give an income of $130,000. As they will hardly ever sell for less than one and a half to two cents apiece, an income of $200,000 to $250,000 from the Centinela orange grove is a quite reasonable expectation. The fruit will be of a fine quality, as the oranges grown at the Centinela Ranch House are large and luscious.

ORNAMENTING HOME.—The green house, flower beds, lawns, drives, ornamental trees and shrubs receive considerable attention, but not as much as they deserve. Remove all attempt at such things from any place and its value is decreased at once in a very large proportion. It is money well spent. There is no lesson of more importance than to teach the art of making home pleasant. This is one of the ways to keep the boys and girls on the farm, and to make them satisfied with their situation. For the want of something nice many a boy has left the country home, made a poor lawyer, or clerk, who would have made a good, successful farmer.—*Prof. W. J. Beal.*

WORK FOR THE SEASON.

Of course it depends upon circumstances, which every farmer should be a judge of, as to what work most needs to be done at this season of the year. It is generally looked upon by grain farmers as a season of rest, unless they have to haul their grain to market or the storehouse. In that case it is policy to improve the dry roads and weather at once.

Dry plowing and sowing can now be done to advantage on land that is clear of bad weeds and foul stuff. On none but clean land should dry sowing be done, but dry plowing—the soil to be plowed again after the weeds get started—will do even for foul lands. However, we cannot advise dry plowing as economical excepting the land is clean of foul seeds.

FENCING.

If any fencing is to be hauled, now is the time to do it. There are few farm in California so well fenced as to be convenient for stock-keeping. It will pay almost any farmer to so lay out and fence his place that he can economically pasture a portion of his farm every year, in the way of rotation, and be able to pasture a portion without herding. On dry farms, this is an important matter, as a field pastured this season will be much more likely to produce a good, clean crop of grain than one that is cropped to grain every season. It is the testimony of many good farmers that pasturing a field is as good, if not better, than summer-fallowing it, both as regards getting a clean crop and a full one. We are compelled to have much faith in pasturing to precede wheat culture, either of cattle or of sheep. Probably sheep would be preferable. So we say that it is important on dry ranches that farms should be well fenced where stock-keeping can be made profitable in connection with grain raising. On farms that will every year produce a good crop no argument is necessary to convince an intelligent farmer that it is to his interest to so fence that he can keep stock to advantage.

Of course setting posts or driving pickets is something that is best done when the soil is softened by winter rains. But if one gets everything ready and at hand for the work it will be greatly facilitated. This is also a good season to look out for and collect

FIRE WOOD FOR THE YEAR.

Chopping is hard work in hot weather, but let any farmer take his wagon and hired men and go into the timber prepared to camp out for a week or two and make a pleasure as well as duty of it, working in the cool of the day only, and resting when it is hot and they are tired, and our word for it, he would find it a recreation better than riding over dusty roads to town to spend his time in saloons or on street corners talking politics and spending money as well as time foolishly, as too many farmers do that we know of.

BUILDING A HOUSE.

This is a good time for building either a house or any needed out-building. How few farmers have habitable houses, such as a wife and family of children require to be comfortable, such a house as they will take a pride in calling *home*—HOME, the most sacred of names—a place that should be consecrated to every good that life is capable of enjoying—the center of our affections and the scene of our dearest joys. It should be made a comfortable abode for our bodies, convenient for the arrangements of the household, so handily arranged in every way as to make house-keeping as little laborious as possible, well supplied with air, sunlight and shade, with water pure, and surrounded with such attractive features as the cultivation of trees and flowers will always give. Paint and whitewash should never become too dingy, but reflect from without the brightness and light that shall be an index of the lives and cheerfulness within.

In building a new house, don't set it nearer than three feet to the ground. Let the wall be high, the windows large, and if you don't build but half of the house at once, let that half be substantial, and let it comprise an ample kitchen, as conveniently arranged as you can contrive it; and if you have to wait, let the parlor be the last room added. Remember that pure air and sunshine are blessings that we should never debar from our living and sleeping rooms and contrive accordingly.

FARM OUT-BUILDINGS.

A roof to shelter stock as well as straw and hay should be also considered a necessary part of every farm. An expensive barn is really not the most desirable thing on a farm in our climate. They may need such things in Maine and Minnesota, but in California a shelter from rain and winds is all that stock requires, and a shelter from the rain is what straw and hay need. We have studied a good deal upon this matter of farm out-buildings, and have come to the conclusion that the best, economically considered, buildings for hay and stock are sheds, so arranged about the stock yards that they will break the prevailing winds, shelter the hay and straw and stock at the same time. Last March we called attention to some on Mr. A. N. Story's farm that come near being the right thing. Mr. S. has a thousand feet in length of these sheds, the cost of which did not exceed $1,000, or one dollar a foot, running length. We reproduce our description:

"The main part of the building is 16 feet across, length of posts 12 feet, sided up on one side only, and covered with four lengths (two on each side) of six-feet split clapboards. On the open side there is an extension of two lengths more of clap-boards, resting upon a plate supported by strong posts, 10 or 12 feet apart, making a wing shed 10 feet wide for the stock to stand under, making the total width 26 feet. The main portion of the building is used to mow away hay or straw. It is pitched in through openings in the back side of the building. This manner of storing saves high pitching and is even handier than stacking. When the cattle commence feeding under the sheds they stand to the mow but are prevented from reaching beyond the length of their necks by a strong bar. Feed cribs extend with this bar clear around the inside of the buildings. As the hay or straw is eaten away it is an easy matter to go along with a fork and poke down more, so that one man can, in a short time, twice a day, feed the stock all the hay they will eat up clean."

The shed portion of this building may be sided up if one desires it so closed, but where wind is broken away by trees, by high fence, or by a similar building opposite, it is even better for stock open than closed. Two or three such buildings a hundred feet long, so arranged as to break the wind from the stock in the corrals and under the sheds, will be found convenient on any farm, and in this mild climate, we believe they would answer every purpose better than a big barn.

SAVE THE STRAW.

There is less need of this injunction than there was some years ago. Farmers are not burning straw now as then. Still, there are too many who do not appreciate its value, and who allow it to lie scattered in the field to be destroyed. The man who will question the economy of stacking his straw for the use of stock, should seek the advice of his thrifty neighbor.

SELLING STOCK.

If there is to be any thinning out of stock for beef, if any one or more of the cows or calves are to be sold, make up your mind which ones to dispose of. Don't sell the best milk and breeding cows at any price. Select the heifer calves from the choicest stock to raise. Sell off the ordinary cows and calves, and turn off as much beef as you can. The high price of hay, and the prospect of another dry season, warrants a close culling amongst stock of all kinds. Remember that it does not cost much to winter a calf, and save the best, or if you buy stock to increase your herds, buy the best calves.

It is poor economy to keep more horses than are needed on a farm. They will soon eat their heads off. Better raise something that will bring cash for beef, mutton or pork. Now is a good time to make plans for disposing of all surplus horses at as good a price as possible, but at some price. The large amount of emigration to this State should have the effect to give a better demand and price to horses.

MAP THE FARM.

Lay it out into such sized fields as may suit your ideal, and carry out your idea of a proper system of rotation. There is a good deal in laying off a farm to fence and cultivate properly, so that the buildings will be in the best place and so that the fields will be handiest for all purposes. An eye for beauty should always accompany every improvement. The orchard should be where it looks the best as

well as be in the best place for an orchard. The house should be on high, healthy ground, and every tree that is planted should be in the best place for it. The good wife should be consulted in every improvement that is contemplated. They who together make a home can best appreciate it, and will become attached to it as every one who has a home should be. The matter of

IRRIGATION

is one which concerns many farmers. Is not now a good time to take into consideration the ways and means for irrigating the farm, or at least some portion of it? Is it possible for you, either alone or in connection with your neighbors, to bring the waters of some stream upon your farm in the winter when water is running to waste? We know of several farms in this valley which might be made to yield abundantly with winter flooding that now are unprofitable from the lack of moisture; and these same farms are so located that they could easily be flooded in winter by a little co-operation among the owners.

Every farm should have an orchard and garden.

A WIND-MILL

is something within the reach of almost any one owning land. Where the prevailing winds blow in opposite directions, as they do in almost all our valleys situated between long ranges of mountains in California, a stationary mill—that is, one without a turn table—is good enough for all practical purposes, and may be made at home. Let the frame be very heavy and strong—made to stand. The shaft can be either wood or iron. Make the fans long enough to give several horse-power. Bore one or two wells for large-sized pumps, and let the mill run all the time. The water can be stored in a tank, the bottom of which is level with the ground, and run in furrows over as large a surface as the supply will allow. A good mill and pump, running whenever the wind blows, will irrigate several acres, if economically handled. It is well to have the mill so located that stock can be watered in either of the fields where they are allowed to run, with as little expense for water pipe as possible. For house use there should be a tank higher than the house, with force pump to raise the water into it, by wind power, and the same power should be utilized to do churning, etc. Those who can afford it will find an extra wind-mill for this purpose, with pipes running through house and barn, a most convenient thing. Why people in the country cannot have things as convenient as they do in the city is more than we propose to explain.

There is much more that might be said under this head which would appertain to specialties, but the foregoing hints on general principles we offer for what they may be worth as suggestions merely.

The farmer who toils for 40 years gathers knowledge and experience costing more labor, weariness and anxiety than the education of any other professional man costs; and then the avowedly professional man charges ten times as much for his advice and work as the farmer does; and in case of a dispute as to a fee, professional men are called in to say what is right, while the old farmer has to abide by the professional decision whether it be for or against him.

LETTER FROM OUR TRAVELING AGENT.

Eds. California Agriculturist: The success I have met with in a five-weeks canvassing trip for your journal, the affable and kindly spirit with which I was everywhere received, especially by old subscribers, and the grand prospects of the Agriculturist in the counties through which I have just traveled, all incite me to give expression to a few ideas picked up during my recent trip. Being well acquainted with the high character of the Agriculturist, I was confident from the very beginning that it needed only a proper representation, a simple unfolding or explanation of its characteristics, to commend it to all lovers of the good and pure. Need I say that a discriminating public nobly responded in support of the Agriculturist, which they unhesitatingly designate a champion of truth, morality, temperance, and the farmers' movement?

A short visit to Washington Corners, Alameda county, will reveal the most flattering signs of prosperity. The crops in the vicinity are good, when we take into consideration the dryness of the season. A large and elegant school house is being erected. A newspaper, called the *Alameda County Independent*, is published there, while Washington College was never in a more prosperous condition than now.

Mission San Jose, and, in fact, the entire country along the foot-hills, from Niles Station to Warm Springs, can boast of excellent crops. I visited Mr. Beard, at the Mission, and obtained from that gentleman much information regarding Alameda county in general, and Mission San Jose in particular. Mr. Beard, besides a magnificent orchard of apples, peaches, pears, etc., and several hundred acres under vines and grain, has about 600 olive trees produced from cuttings After experiment, he finds that the best time to plant them is in the fall, and that cuttings from young trees are the best. They commence to bear when about five years old, and are in full bearing at eight. So well have these trees throve that from one tree alone 120 pounds of olives were obtained.

Mr. J. C. Palmer, of the Mission has a fine vineyard of about 80 acres, all in excellent condition, and promises to bear immensely.

The crops in the vicinity of Centreville, Alvarado, Mt. Eden and Hayward are fine, and will compare favorably with those of any other portion of the State. A post-office has lately been established at Niles Station, some new buildings are being erected, and the town is fast developing.

George Buttner, an old resident of Sunol valley, has recently built a large and commodious hotel at Sunol Station. The farmers along the valley are much pleased with the prosperity of the crops, and may compliment themselves on having one of the finest agricultural valleys in the State.

Livermore cannot boast of the fertile soil of Hayward, Mission San Jose or Alvarado. A gravelly soil predominates, and the crops this season are at a serious discount. I visited the new coal mines, about eight miles from Livermore, and have every reason to consider them a success. Already a shaft of 375 feet has been sunk. The vein is about five feet thick and of an indefinite length and width. Eighteen men were at work, and an additional force will be employed as soon as a new steam engine is erected, which will probably be in a few weeks. The coal is of a bituminous quality, and is selling at $4 per ton at the mine. Mr. Thomas Harris, a practical collier, is the superintendent.

San Ramoan valley, including Pleasanton, Dublin, Limerick, Danville, Alamo and Walnut Creek, is one of the most fertile valleys in the State. The crops are looking splendid. The late rains, however, caused considerable damage in throwing down portions of the crops which were very heavy. The farmers here are seriously discussing the propriety of having a railroad through the valley, and advocate the scheme with much warmth. The course taken by the Contra Costa *Gazette* in disapproving of the enterprise is severely criticized, and rumors are afloat that another county paper devoted to the vast interests of Contra Costa will soon be established.

The crops from Altamont to the Mountain House are a veritable blank. Several of the farmers in this section have already taken flight to a more congenial clime. Very little of the animal creation greets the traveler, save squirrels, lizards and owls.

The country from the Mountain House to Point of Timber is more prosperous, leaving, however, ample room for improvement. Point of Timber is a rich agricultural country, well shaded with trees. The farmers in general manifest evidences of much prosperity, and have had a good three-fourths crop.

About two miles from Point of Timber are the salt springs which your correspondent visited, and learned from several persons there that these springs, for medicinal qualities, are second to none in the State. There are, however, no accommodations for visitors, the absence of which will necessarily prevent many from partaking of the advantages which, under different management, might be enjoyed by the health-seeking public.

The country around Antioch is hilly and the soil rather barren, consequently the crops are not like those of Eden Plains or Point of Timber. The town itself is quiet, and people complain that "money is scarce around that quarter," and yet the Agriculturist circulated as freely in that section as in more favored districts. We hope that a better state of things will soon be brought about, and that the generous people of Antioch and vicinity will have to build additional warehouses wherein to store the produce of next year's crop.

Passing Summersville and Nortonville—cities of coal mines, steam engines, heat and hills, we slide down into Mount Diablo valley, one of the finest in California. Well shaded with trees, liberally supplied with water, the soil rich and adapted to raise almost all kinds of fruit and vegetables, with many a fine vineyard and farm house, and Diablo in the distance, boldly and majestically looking down from an eminence of over 3,000 feet, we unhesitatingly say that the people of this valley may justly feel proud of their situation. And there is Clayton, the queen village of

Contra Costa county, beautifully shaded with trees in the heart of this lovely valley.

The crops here are fine, and almost continue so until Martinez is reached. Leaving Martinez, quietly nestled down on the Sacramento river and almost surrounded by hills, passing Benicia and her arsenal, your correspondent arrived at Vallejo. Still onward, from Vallejo and her navy yard to Napa City. The crops in this section are what we might term average. The new Insane Asylum is in process of completion, and judging from the immensity of the building, or rather series of buildings, the uninitiated would imagine that all the wrecks of intemperance in the entire State could be conveniently accommodated within its walls.

Towards Sonoma the soil is far more fertile than in the vicinity of Napa. With its surroundings, the town of Sonoma itself presents an alarming contrast. In the heart of a rich, prosperous, well populated country, it seems given to decay and death. It presents very little evidence of prosperity, but it is hoped that ere long its lost prestige will return, and that it will take its place among the prosperous towns of the coast.

Petaluma is one of the liveliest towns through which your correspondent passed. It is evidently on the high road to prosperity.

The late frost caused serious damage in nearly all the places I have visited. Mission San Jose, Hayward and a few other places might, indeed, be excepted. The farmers, however, express themselves satisfied with the general yield.

Returning thanks for the many courtesies extended to me during my trip by friends of the Agriculturist, I beg to subscribe myself,

Very respectfully, G. G. H.

A CONSERVATIVE ORGAN.

If the *Rural Press* of San Francisco is not a conservative organ, then we admit that our senses are so prejudiced against it that we cannot see straight. Were it really run in the interests of those who seek to monopolize all the benefits that can accrue from imposing upon the credulity of honest Grangers who rely upon representations of this same class, we can conceive of no more subtle policy for its conduct than its present stoical conservatism.

The Granger movement was started on radical principles, loud and earnest for reform. Its design was to correct the many evils that were, and still are, bearing heavily upon industry, and which make the producer a subject to be fleeced by greedy capital and its manipulators, and by smaller speculators upon the necessities of the people. The movement called out nearly every patriotic farmer, and many who felt the heavy load of oppressive tribute they were paying went in with a no less hearty determination because impelled by a selfish motive.

It is perfectly natural that such a movement, which embraced the sons of the soil, and which called for active measures and offered remuneration to organizers and others, should have barnacled upon it scores of designing, shrewd men who were anxious to profit by the tidal wave, and had the cheek to put themselves at the very wheel, as captains if necessary, to make themselves popular and "representative," and give them at once honor and coin.

The principles and true spirit of the Grange, or farmers' movement, to-day, are radical. How so conservative an organ as the *Rural Press* is can suit the Grangers all over the State is to us a little wonderful. But a paper run strictly on *policy*, as that paper is, of course is supposed to be shrewd enough to manage all that.

We are aware that there are many things connected with this Grange movement that need sifting rather fine, and we would like to see the Grangers' volunteer organ take up such matters as need over hauling and thus prove to the honest and confiding farmer that it is really, as well as pretendingly the farmer's friend. We are really anxious that all the good should come out of this movement that is possible. And to be successful, in the broad meaning of that term, the Grange must not be afraid to deal open-handed with those who are using it for personal ends.

We don't believe in covering up nor letting alone corruption of any sort that needs ventilating in the farmer's interest. But then we are not an organ. The Grangers' Bank and Grangers Business Association and Grangers' Emigrant's Bureau do not advertise with us. The big men of the Grange do not patronize the California Agriculturist in any way. We do not hob-nob with them nor hang upon their colored skirts, nor ask any favors of them, and of course we do not feel as much under obligations to these leaders as our contemporary and organ, the *Rural Press*. If we did, which would be impossible, we might possibly appreciate a conservative sentiment and hold our horses with a curb-bit.

Jute Culture.

Mr. Le Franc, of New Orleans, raised last year twenty bales of jute. He concludes a report to the Department of Agriculture as follows:

For new observations, I can re-assert that ordinary jute growth gives an average of at least one ton per acre of fiber, and that the whole cost of production will not exceed $25. In good, moist land jute grows ten feet in average, and has one-third of its body in fiber. The mower and reaper applied on wheat cut jute perfectly well.

Experiments were made in France last year to test how far the humidity of the atmosphere is affected by forests. One set of instruments for recording humidity were placed in the forest, and the other in the open air, a short distance off. The records show that more rain fell each month in the forest than in the open air, and the total rain-fall for six months was 7¼ inches in the forest, and in the open field less than 7 inches.

Correspondence.

Letter from Monterey County.

Eds. Agriculturist: Your valuable paper comes regularly, but I have failed in my duty to you until now. I believe the best apology that I can make is to send you two dollars, as I have kept you out of your hard earnings up this time—but I am very sure that my negligence has haunted me enough on account of reading so valuable a journal without paying for it in advance. I esteem the Agriculturist as being of more practical value to the farmer than any paper I ever read. So far as I am capable of judging, it is sound on all points—with the exception of "moles." I am a farmer of many years' practical experience, and I know the "mole" to be very destructive to gardens.

Perhaps some of your patrons would like to know

HOW TO GET RID OF FERNS, OR BRAKES.

I can tell you how I freed a part of my farm of them, and they were so thick that I could not produce a crop to any advantage. I just cut them off at the ground every two weeks all summer until the last of September. This I did in 1864, and I have not been troubled with ferns since.

TOADS.

I think toads are of great worth in a garden or on a farm. But you must keep your bees up out of their reach, for they eat them greedily. This they do at early night. When the evening is so cool that the bees are not watching about their doors, the toad will butt the hive, and as the bees run out to see what is the matter it catches them. This I have seen them do, and it is "true as gospel."

The late heavy frost did great damage to fruit in this county, but my apple trees are very full and promise to make a heavy yield.

EFFECT OF USING BAD WATER.

I owe you more than money for your able journal. I think it saved me and my four daughters from an attack of typhoid fever. Last fall we were all complaining of headache and felt dull, and had been so for perhaps ten days, and were getting worse. We were not given to headache prior to that time. About that time I noticed a warning in the California Agriculturist and Live Stock Journal against using impure water which put me to thinking, and to investigating. And I found the curbing in my well badly decayed, and the water impregnated with the substance and I abandoned the use of it immediately. I cleaned out a nice boiling spring near by, the water of which we are still using. It was some time before we got clear of that headache. And I believe that had it not been for the Agriculturist we all would have been taken down, and perhaps you would not have been troubled with this letter.

I have been fighting against

A NOTORIOUS LAND SWINDLE

in this county for the last six years. But the grantees procured a patent at a fearful cost—not in money, but through perjury, fraud, and offers of bribery. There is an army of well drilled land perjurers in this State who follow land grabbing for a trade, and they will swear to whatever is necessary to carry out their schemes. I have been in this part of the State for upwards of nineteen years. I have taken great pains in settling upon public lands—lands that the grantees themselves *affirmed to be public, and outside of their grants.*

I have bought and improved two homes in California, but I cannot call them my own to-night. Thousands have shared the same fate, and the work of destruction goes "bravely on." Our sheriff told me the other day that he had just served seventy settlers on the Milpitas grant in an ejectment suit which is another swindle.

As I am not used to writing for papers, excuse "style," etc. With many regards,

Yours, J. C. Gaillard.

July 11th, 1875.

Cultivation of Medicinal Plants in California.

A gentleman who has paid a good deal of attention to the subject of medicinal plants and the study of medicine as well as of agriculture, and thinks it possible to produce such roots, barks, herbs, etc., in California, and who thinks that many of our immigrants might find profitable employment by starting into the business for themselves here, sends us the following hints upon the subject. He begins by advising the cultivation of the olive tree, flax seed and castor beans for oil. Our readers are already pretty well informed upon the foregoing, and for several years quantities have been produced in California with success. The cinchona tree, which produces the Peruvian bark is next treated on. He says:

As to the feasibility of raising in California the cinchona tree, which produces the Peruvian bark, from which quinine is manufactured, there can be no question. Our climate is the exact counterpart of that in which it grows in South America. Being under the equator, notwithstanding the elevation of several thousand feet above the level of the sea, the climate is exactly like our's—a perpetual spring. The English have tried the experiment of its transplantation on the lower benches of the Himalaya mountains in India with success, and the Dutch have introduced it into Sumatra with similar results. For many years past the collection of the bark has been entrusted to Indians, who climb the trees, denude them of bark, and leave them as the white, unsightly ghosts of the departed forests. So extensively has this destructive process been going on, that it has been apprehended that the world's supply of bark would in no very remote future be entirely cut off. Hence the wise forethought of the enlightened nations above mentioned. Shall our's be behind hand? The exhaustion of the Cinchona forests would perhaps be the greatest calamity that could befall mankind. A celebrated physician, being asked what single medicine he would save in case all medicines should be destroyed except one, answered, "quinine." And in regard to its anti-pyretic powers, he was right. It has been found to exert a more direct and lasting effect upon fever, the universal manifestation of disease, than any other article in the *materia medica*. Its priceless worth in the malarial regions of our richest and most extensive valleys and river bottoms is familiar to every physician from Maine to California. That it has been the main cause of the lessening of the death rate throughout the civilized world of late years, there can be but little doubt.

Of the profitableness of its culture on the part of individuals, or of the State, there can be no question. With the bark at 25 cents a pound, wholesale, and quinine from $3 to $5 per ounce, an acre of these trees would constitute no inconsiderable bonanza. Besides, the many thousands of dollars sent out of the country for its purchase would be saved to the State, and its cultivation and preparation for market, and the great number of articles manufactured from it, would give profitable employment to large numbers of people.

"Several years since, a proposition was made before the American Medical Association to introduce the culture, as an experiment, of the Cinchona tree in the different States of the Union. The reason therefor was the scarcity and high cost of that invaluable drug, quinine."

The subject has also attracted the serious attention of the State Medical Society of California, which recommends the cultivation, on the part of the State, not only the Cinchona tree, but also of all other medical plants; in other words, the establishment of four botanic gardens, similar to those in Europe, in four appropriate points in the State where suitable temperature, elevation and soil can be obtained. These, the Society very properly advise, might be located near some of the numerous medical springs to afford cheap resorts to our invalid poor. The subject is still under discussion, and we hope the Legislature may render efficient aid to an undertaking of not only State but National importance.

The Agricultural Department of the State University at Berkeley, if it is not too busily engaged in getting up party "slates" and cultivating political "rings," might do much to forward this and other useful enterprises by raising the cuttings and plants and distributing them free to all who would cultivate them, and by disseminating useful information in regard to the cultivation of this and other valuable members of the vegetable kingdom.

The Department of Agriculture at Washington, if not too busy in President-making, might also lend a helping hand in the good cause. But it seems almost too much to expect anything of governmental departments and office holders. The public good is ignored and self-aggrandizement seems to be the order of the day.

The cultivation of Rhubarb might be engaged in with other articles, we should think. There can be no doubt about its growth here, as any one can convince himself in a moment by visiting our markets and examining the fine, large, long specimens in the shape of "pie rhubarb" there exposed for sale.

The Aloes could be cultivated on our dryest soils.

All the aromatic herbs are already cultivated on a small scale by our market gardeners. There can be no doubt, therefore, about their growing here.

We understand that Mr. Boots, one of our most enterprising farmers, is raising several acres of Peppermint. The sale of oil alone at from $6 to $6 50, wholesale, would amount to many thousands of dollars.

Safron has been raised here by Mr. Frank Lewis, of San Jose, in perfection, and would prove a valuable article of production.

All the various herbs, such as Catnip, Boneset, Lobelia, Geranium, Dandelion, Goldenseal, Hoarhound, Mandrake, Rosemary, Sweet Margoram, Pennyroyal, Rue, Tansy, Wintergreen, Wormseed, Yellow Dock, and many others, might be raised here with profit for the very plain and simple reason that our dry climate facilitates not only the drying and preservation of plants and roots, but also the concentration of all their medicinal qualities in the dried herbs and roots. It would be but a little while, in our opinion, before California dried herbs and roots, like her dried fruits, would command the market of the world.

The oil of Bergamot, used so extensively in perfumery would not yield a bad revenue at $8, wholesale, per pound.

If we have not enterprise enough among ourselves to establish this great branch of productive industry, we might invite the Shakers, who have several societies in different States in the East, to establish a similar institution here. They would find the climate of California far superior to all others at the East in properly and speedily curing all kinds of herbs and roots.

In connection with this subject, we might incidentally call the attention of our orange orcherdists to the manufacture of citric acid and lime juice. Both these articles are in good demand and command remunerative prices.

[Right here we will add that the cultivation of *garden and field seeds* might be made a profitable business in our State for many persons. We have often wondered that more attention has not been paid to such culture. Of course, irrigation would be necessary for many things. As to herbs, our dry, hot climate would give much strength of oil and flavor to them. The ideas of our correspondent are worthy of consideration.]

They Have Come to Stay.

Eds. Agriculturist: What all good Californians have been praying for the last ten or fifteen years—the great tidal wave of immigration—has come at last. It is pouring in upon us through the Dutch Flat Pass like a veritable human wind-fall. It is spreading through our mines and timbered mountains, traversing our rich valleys and extended plains, and crowding our towns and cities. Some come with money to purchase homes; others with muscles to earn them. The former can take care of themselves, but the latter need, and must have, assistance, but all they ask is work.

The wail of business men, capitalists and large land-owners for a number of years past has been for population. "We want settlers to develop our resources, workers to transform our raw material into merchantable values, and consumers to establish at our doors the best of all markets—a home market." This has been the burden of the song sung from the huskings, preached from the pulpit, and printed and scattered broad-cast throughout the civilized world by all the newspaper presses of California. And, as if this was not enough to attract immigration, various towns and cities, through their boards of trade, have published thousands of books in pamphlet form, embellished with engravings of their choicest improvements, and full of "school privileges," "rich soil," "healthy climate," "fine business opportunities," and everything that promised to be attractions. We do not say that there has been any misrepresentation or exaggeration in these statements. Some of them may have come short of the reality; but they have served the purpose intended. They have drawn people here from the frozen regions of the north, the rocky shores of the East, and the miasmatic graveyards of the sunny South. The influences have been extended even beyond the sea, and brought bluff John Bull from "the sea-girt isle," the merry Frenchman from the vine-clad hills of France, the Switzer from his Alpine home, the German from Father-land,

and the sons of Erin in their usual proportion. Now that these hardy, enterprising and industrious, but needy, people have come to our shores, at our bidding, the great question arises, "What shall we do with them."

As the great land-grabbers and capitalists were the first and loudest callers for this influx of population, let them first open their hearts and purses at the same time, and provide these people with homes on their broad acres on liberal terms, supply them with tools and animals, and provisions for a year, and our word for it, they will make a fair interest on their money, besides doing a righteous deed.

Others who have the capital might invest it in manufacturing enterprises that would employ thousands of these people to the great advantage of all parties. There are hundreds of articles imported into this State at a heavy cost of time and freight that could be profitably manufactured here. In the article of wool alone it is certainly a suicidal policy to ship it East in the raw state, and then import it in the manufactured article, paying double freight, when we might manufacture it here and command the markets of the world. We haven't half the sense of our forefathers who separated from the mother country because England attempted to impose this very policy on the infant colonies.

Every farmer, too, throughout the length and breadth of the land, should look kindly upon these immigrants, and employ them upon every possible occasion—as you would your brother, instead of a Chinaman.

Our next Legislature might inaugurate a general system of irrigation—the vital want of the State—before all the water, too, was gobbled up, and thus give employment to thousands of immigrants who will seek our shores in the future. The waters in our mountains would irrigate all our valleys, make California the granary of the world, and provide happy homes for millions instead of thousands, as now. Why should it not be done? ECONOMIST.

SAN JOSE, July, 1875.

A Plea for Cats.

EDS. CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL: Will you allow me a little of your valuable space to say a word for one of the farmer's best, but least appreciated and most abused friends—the domestic cat. I am not insane enough to ask the people dwelling in cities to look with favor on the increase of the cat tribe, but to the farmer I say, *don't kill the kittens.* Drive them out of the house to the barns and other out-buildings, and give them a chance in the fields, particularly in the orchard and vineyard. Make places for them to breed and to escape to when Towser and Bose double-team on them. A dry goods box under the straw stack, with a hole sawed on each side and a six-inch board or pole put up a foot from the ground so the straw will hang over it and give them an entrance to the box, is a good show for a reasonable cat.

In a vineyard it will pay to leave out a pair of vines every ten acres, and throw up a rockery or other shelter for a place for cats. There need be no loss of bearing vines, for the nearest vines may be trained over the place. Perhaps one cat in five hundred will suck eggs or kill chickens, but it is almost invariably the pet cat that grows up among the children and is hugged out of shape and manners that does mischief. The half-wild cat is oftenest seen watching a gopher hole, and when not disturbed there is soon one gopher less to eat roots and let the irrigating water run loose. This age almost worships graceful forms and movements, and the unhandled cat excells in both. Many of your attractive "rockeries," both in public and private parks about the city, would be all the more attractive if they had within a home for cats. A stately Thomas cat perched on the top and half a dozen kittens frolicking about the base is a sight to please a lover of the beautiful and a hater of the rascally gopher.

C. A. WYMAN.

Query About Hay-presses.

SALEM, OREGON, July 15, 1875.

S. H. HERRING & CO.—*Gents:* I wish to know if somebody will send me a circular for a *hay-press.* I do not see any advertisement in your paper, and I do not know where to send for information about them. There is a good hay-press invented and made here, but I thought I could do better in California than to pay $260 for one here. I think the price too high.

We like your paper, although not quite so well adapted to Oregon as to California in some things. Yours, truly,

THOS. C. HAINES.

If the manufacturers and dealers in hay-presses in California do not consult their own interests enough to advertise in the AGRICULTURIST AND LIVE STOCK JOURNAL, it is their own lose.

The two leading presses in California are the "Eagle," manufactured by Kimball & Co, San Francisco, worth $225 or $250 each, and the "Price," or "Petaluma," by Baker & Hamilton, San Francisco, worth $300 to $500 each, according to size. The Petaluma press seems to be the favorite. We give this information "gratis," but at the same time advise our friend Haines to *patronize home industry,* and if he can get a good press for $260 in Oregon, in is probably as cheap as it can be made and pay the workmen, and probably as well as he could do in California.

Domestic.

Chats With Farmers' Wives and Daughters---No. 8.

BY "JEWELL."

MORE bread-making? Yes. I make it a point to *succeed* in whatever I undertake to do, from the sweeping of a room to the making of a perfect-fitting shirt. If it be well done, there is a sense of power that nothing short of knowledge and success can give. It took me nine months, once, to learn how to iron a shirt well; but that very drill was good for me, and I can afford to give time for practical knowledge that is of so much use that even every Chinaman is supposed to understand all about it. So, in spite of my frank confession, I was fully resolved to "try, try again," and the many kind receipts sent me by dear readers of the AGRICULTURIST have helped to push this resolve to a speed trial, and, may I add, *success.* Well, friends, if several consecutive batches of light, sweet, white and tender bread can be called a success, I am the victor. But, alas! I dare not boast, as I have made only one batch of yeast as yet.

A kind reader of the AGRICULTURIST (Mrs. Summers) sent me, by the editor, a bottle of her "jug yeast," with her compliments and directions how to proceed, which were so very simple and plain that I felt "to try were to succeed." The beauty of this "jug yeast" is that one can bottle it and keep a week or two, which is a saving of labor, and we should all try to do that. Here is Mrs. S.'s receipt:

RECEIPT FOR MAKING JUG YEAST.

"Take about one quart of potatoes; pare nicely, and boil in enough water to cover them well. When well cooked, drain and mash smooth. Now take the water they were boiled in, pour it back on the potatoes, stirring all the time. Take a handful of hops, put them in enough water to make a gallon of yeast altogether, and boil for ten minutes; strain into the potatoes; add of salt and sugar each one-half cup; stir well, and then let cool till milk warm, then add a cup of yeast. Now cover up loosely until it commences to work, then put it in a jug and set the cork loosely for one day, when it may be corked tight and kept in a cool place. Shake well before using.

FOR MAKING BREAD,

pnt flour enough for your baking in a bread-dish, make a hole in your flour, put in a cup of yeast, three or four pints of warm water, and a teaspoonful of salt; mix slowly and beat well into a stiff batter; cover it lightly with flour and set it away in a medium warm place. When light mix the flour in slowly till it becomes dough; take it ont on your kneading board and knead it well with your hands, adding flour gradually until it becomes nice, smooth, springy dough, then place jt back in your bread-dish to raise; when light, take it out and knead, using just enough flour to keep it from sticking, till it is nice and smooth, then make it into loaves, put it into pans and keep warm till light, then bake. '

The following receipt by Alice I have not tried, but can vouch for it, as I have eaten of bread made by the same fsir hands that sent it:

"*Dear 'Jewell':* The AGRICULTURIST has just come to hand, so fresh and interesting. And as we feel particularly interested in 'Jewel's' writing, we turned to her department and found her in great trouble about her yeast bread. I felt very sorry for her—so sorry that I pushed back the jar of yeast I had just finished making for to-morrow's baking, and hurried in without coverlng it, and told mother I would just write and tell her how I did, as I was having such good luck at bread-making lately. So here is the recipe, under ma's directions: Peel three common sized potatoes and boil till very soft in a quart of water, then take out the potatoes, mash fine, keeping the water boiling hot. Add two big spoonfuls of fine flour, one of salt and one of sugar. Now, pour the boiling potato water into the whole, stirring it briskly, so that the flour will scald. Steep a pinch of hops five minutes in half a pint of water, and pour in. Let this cool until lnke warm, then add one teacup of fresh yeast from your good neighbor's crock, or from the brewer's. Make the yeast in the morning, and by bed time it will be ready for use, at which time I stir up my bread. For three quarts of flour add one teacup of yeast, and wet it with cold water, mix it soft, and sift flour over the top to keep it all soft and alike. In the morning it will be ready to mould into loaves; put in the bake pan to raise, and when light bake.

"During this warm weather we make yeast

one day and bread the next. We go through the same process of yeast making every time, adding your cup of old yeast from the jar—which article is much better than tin, as it will keep cool and sweet longer. You can make bread of the same yeast as long as it will keep sweet, and you have enough left to start another mess with."

Ah, fathers and brethren and husbands, I wonder if you half appreciate the life and love we women put into your very blood through the stomach, or how tired and weary many a woman grows in attending to her daily round of duties that keep your homes clean, neat and thrifty. If you do, pray acknowledge it in words of cheer. Women need praise for their kindly labors and trials much more than your wonderful new grain-cutter which works so to a charm—and *that* you can praise to a neighbor or your wife, perhaps, without ever a thought of the far greater and more wonderful piece of machinery by your side, whose complex structure combines intelligence of mind with affection, and soul life with so much mechanical power and skill. See to it that you give her equal care and rest you do your horses and iron and wooden machines — oil her with loving words and actions, and bestow equal praise for faithful work, and my word for it, your human machine will last longer, work better; and, more than all, will be worth more in the end than when you first promised "till death do us part." For age should improve as gray hairs add a charm that sunny curls never owned. The wrinkles that have displaced the dimples of youth, should only show where the smiles and joys have left their mirriads of foot-prints behind them. Living and loving together for years must bind our hearts together. Our joys and sorrows one, life's interests the same, our minds and souls will grow more harmonious and sympathetic. Age softens the passions and impulses, elevates the ambition, matures the judgment, and, though more grave, we are not sad, for life begins to grow more comprehensible, and death nearer and dearer to us.

Before closing this rambling letter, I will give a recipe for making

CREAM PIE-CRUST,

something which our country readers can enjoy but which few city folks can. Take flour and seive it with a little soda; wet up with sour cream; roll same as for other pie-crust. It is very nice. Made with Graham flour, you need no soda, nor will it be sour.

Here, also, is a palatable dish, which is called

ENGLISH FRUIT PIE.

Take a deep, round dish to bake in; fill a cup with sugar; turn it upside down in the center of the dish, leaving it there; then fill with fruit, cherries, plums, berries or any kind. If very juicy, no water is added; if not, put in a little water, then put on a crust and bake as for pie, and bake slowly. When served, cut a circular piece and take out the cup, when the juice will fill the dish. Very nice.

GRUEL RECIPE.—For a very delicate sick person, take two tablespoonfuls of Graham flour; stir this with cold water; strain through a seive; stir this into one quart of boiling water, and cook five minutes. Season it with a very little salt and sugar—a little lemon juice added makes it better. This is excellent. Try it. ALICE.

Familiar Talks—No. 2.

BY "SNIP."

I had intended giving my rules for making yeast and bread this month, but it is likely there will be plenty such recipes sent for "Jewell's" benefit, so I will only offer a few suggestions in regard to

MAKING BREAD.

I always knead bread twice. Letting it become just as light as possible in the sponge before moulding into loaves. If, as is sometimes the case, I am obliged to let it stand longer than it should, and there is danger of its being sour, I knead in a little white sugar. I once thought soda was indispensable in such a case, but I do not like to put it in light bread. Sugar is better.

I have tried "Jewell's" plan of cooking rice in a bag, and shall always cook it so when I want plain boiled rice. I make a *substantial* dish of this article by cooking it in the water in which fresh beef has been boiled.

HOW TO COOK CARROTS.

Many think that carrots are unfit for table use. We like them very much when cooked in the following manner: Pare them and cut into slices about a quarter of an inch thick; boil in clear water until done; pour off the water, and cover them with milk in which a very little flour has been stirred; add a little butter, pepper and salt to your taste, and then boil long enough to cook the flour.

Onions cooked in this way make a favorite dish with those who are brave enough to eat this condemned vegetable.

A Farmer's "Jewell."

EDS. CALIFORNIA AGRICULTURIST: Please allow me to say a few words to your new correspondent, "Jewell," before she again gives to the public her knowledge and experience in making bread, and thereby injures our claim to political equality to which our social and moral superiority gives us so sure a title. Immorality and dishonesty in every branch of our political and social system proves the great depravity of the male element; and while the only hope of reform lies in the superior mental capacity of our sex, here comes a "Jewell" of a farmer's wife saying that she cannot make a loaf of bread, but that at last she learned to make salt-rising from her husband, who "knows everything." This may be amusing to her, but it is not so to me, to whom she is pointed out as an example—one who can instruct others, but cannot even make salt-rising without instruction from her lord!

Now, a word to "Jewell." First have good potatoes to make yeast stock by boiling and driving through a colander the potatoes with the water; add for one pound of potatoes one tablespoonful of brown sugar and half a spoonful of salt; add also the water of a small handful of hops; put all of this into a glass jar and keep the air out. This will keep for a month in a cool place. When you wish to make a loaf of four pounds, put three pounds of flour in a dish with some salt, and into this one pint of yeast at least twelve hours old. Mix one teacup of the above yeast stock with three tablespoonfuls of flour and warm water. This will be your sponge. Let this stand in a temperature of about 60 degrees until it has risen very visibly, then, and not before, add flour and work it until it no longer sticks to your hands; then put it into your pan and let it rise again, and bake it under such a heat as to give it one hour's time to bake brown. On the day when you intend to bake bread be sure not to wear any "blue."

CAMP SARA TOGA.

POULTRY AT THE INTERNATIONAL EXHIBITION.

The admirers of fine poultry will no doubt have an opportunity during the International Exhibition to gratify their taste fully, as it is the design of the Centennial Commission to provide everything requisite to the proper reception and display of fowls and birds of every class.

It is desired by many that there be a permanent, as well as a temporary exhibition of poultry, and if applicstions for space for the exhibition of fowls during the six months covered by the exhibition, are received in sufficient numbers to warrant the outlay, the Commission will probably adopt measures to afford the proper facilities.

If the design of a permanent exhibition be carried out, the display should be such as would impress the character of each breed upon the mind of the observer.

This cannot be done when the exhibition is confined to trios in separate coops, but only by the display of as large a number as can be placed in one enclosure; thus affording by the multiplication of individual birds, each of the same breed, an opportunity of studying the characteristics of each particular family. Prominent poultry breeders could readily supply the birds for such an interesting and instructive exhibit.

The temporary exhibition will commence on October 25th, 1876, and last till November 10th, a period of fifteen days. The Commission will erect shedding, and the birds will be exhibited in the same boxes or coops in which they were transported. For the purpose of preserving uniformity, these boxes will be made according to specifications furnished by the Bureau of Agriculture.

Exhibitors will be acquired to assume all responsibility of feeding, and general attendance on their birds.

Only such specimens will be received as are of pure breed, and even these must be highly meritorious.

Further information may be had by addressing the Chief of the Bureau of Agriculture, Internation Exhibition at Philadelphia.

The Farmer's Cause.

We shall endeavor to advance our cause, says the *Western Agriculturist*, by laboring to accomplish the following objects: To develop a better and higher manhood and womanhood among ourselves. To enhance the comfort and attraction of our homes and strengthen the attachment to our pursuits. To foster mutual understanding and co-operation. To maintain inviolate our laws, and emulate each other in labor to hasten the good time coming. To reduce our expenses, both individual and corporate. To buy less and produce more, in order to make our farms self-sustaining. To diversify our crops and crop no more than we can cultivate. To condense the weight of our exports, selling less on the bushel and more on the hoof and in the fleece. To systematize our work, and calculate intelligently on probabilities. To discountenance the credit system, the mortgage system, the fashion system, and every other system tending to prodigality and bankruptcy. We propose meeting together, talking together, working together, buying together, selling together, and in general acting together for our protection and advancement, as occasion may require. We shall avoid litigation as much as possible, by arbitration in the Grange. We shall constantly strive to secure entire harmony, good will, vital brotherhood among ourselves, and to make our Order perpetual. We shall earnestly endeavor to suppress personal, local, sectional and national prejudices, all unhealthy rivalry, all selfish ambition. Faithful adherence to these principles will insure our mental, moral, social, and material advancement.

Apiary.

Bee-Keeping in California.

Southern California is attracting the attention of all the apiarists in the United States. It is evidently the bee-keeper's paradise. We think that we can do no better for this department, this month, than to extract from some letters on bee-keeping in Southern California which we find in the *American Bee Journal*.

A gentleman who signs himself "Amateur" writes:

Time has wrought a good many changes since I last wrote you. My attention has been turned a good deal to other things for the last two or three years, so that I have not taken the interest in my bees that I should have done. But now I am thoroughly settled in my pet business on the far off Pacific Coast, and from this "land of honey," as well as "land of gold," I propose shaking hands again with my brethren, through the columns of our beloved *American Bee Journal*.

The glowing descriptions of this coast as a honey-producing country, induced me to leave home and friends in the beautiful Mississippi Valley and seek a home in the mountains of Southern California.

There is so much in this country of interest to bee-keepers that I hardly know where to begin. I will, however, begin at the beginning and tell something of the history of bees in this State.

The first bees brought to California was in March, 1853, by Mr. Shelton, who bought twelve hives at Aspinwall. These dwindled down to one before swarming season. This one threw off three swarms, two of these were sold in the fall, one at $105, the other at $110. The next lot were imported in 1855. But not until 1857 and 1858 were there many bees brought here. So that by 1860 there were several thousand colonies of bees in this State. In the year 1860 Mr. A. J. Biglow brought from the apiary of Mr. S. B. Parsons, of Flushing, L. I., 113 Italian queens, and arrived safely in Sacramento with 111 of them. So you see that the Italians had nearly an even start with the blacks here. Although it has been but a short time since the first introduction of this noble insect along this coast, yet for several years past the woods and eaves have been full of bees, and thousands of them have been taken by hunters every year. The Italian stock is mixed many wild bees. Notwithstanding this country is so well adapted to the culture of the honey bee, and this insect has done so well here, it has only been a few years since the real resource of the country, in this particular, has been known.

At first bees were kept on the valley lands, where they do well, but make an inferior article of honey. But the honey district is on the western slope of the mountains, and is comparatively a small district. There are, it is true, many places not yet occupied by apiarians and many others that never will be, owing to the want of water. My present location is in the Santiago Canyon, 30 miles S. E. of Anaheim—my P. O. The surroundings are beautiful, and we have 150 colonies of bees, from which we have taken up to the present date 3,000 lbs. of honey. We expect to take 30,000 lbs. and increase to 300 colonies this season.

The honey-producing plants here are almost innumerable, as every plant and shrub on the mountains has a bloom from which the bee gathers honey, some are in bloom the year round.

A swarm put into an empty hive in November will live through winter and probably swarm in May next.

The earliest plant is the *manrinata*, which blooms about Christmas and produces a great deal of honey. Then comes in the many varieties of *willow*—some for pollen and others for honey. From February 1st there are a succession of plants in bloom, giving the bees every opportunity for swarming by the middle of March. Through April they have ample time to become strong for gathering honey from sage and other varieties of bloom in May, June and July. The principal plant is *white sage*, which blooms about the middle of May, and continues in bloom about seven or eight weeks, and from which the best quality of honey on earth is produced. The white sage grows on the hottest and dryest portions of the mountains, and produces abundance of honey every year, whether it rains or not; the hotter and dryer the better. There has never been a failure known here in the bee business owing to the season.

About California.—W. J. Whitney, of San Bernardino, California, sends the same journal the following general directions about emigrating to this State, in answer to the following questions:

Don't think of shipping bees here from east of the Rocky Mountains, as it will be money and bees wasted. If you can get half what the hives cost there, you had better sell them than to ship them.

Now for your questions in regular order.

1. What can good stands of bees be bought for in your vicinity? A. From $4 to $12, according to condition, style of hive, etc. In Los Angeles, for $2 50 in Harbison hives, the honey they make there not being saleable, since San Diego honey came into market.

2. There are two mills dressing, cutting up, and putting together (if wanted), at the following prices:

Harbison's, ready for putting together, $1 80.

Langstroth's, ready for putting together, $1 70.

Watson's improved Langstroth for five section boxes, $1 90.

Louth's improved hive for section boxes, the best yet out for this country, $1 95.

Section boxes for surplus honey, 13 cents each.

Cases, 22 each to hold 4 section boxes, can be had in any quantity.

3. Plenty of work to be had during haying and harvest threshing, etc., at from $2 to $3 per day and board. We can raise any amount of broom corn or any other corn you wish to plant. I should think broom making could be made to pay here as they are worth from 40 cents to $1 each, according to quality. There has been no broom corn raised here for market yet, that I know of.

4. We think fruit raising and bee culture our "best hold" here. We raise apples, plums, peaches, apricots, quinces, figs, almonds, walnuts, oranges, lemons, blackberries and strawberries. Of grapes, we can beat the world. I have the White Muscat, Flaming, Tokay, Rose of Peru, Hamburg and Mission, or native California grapes. We also raise pumpkins, squashes, melons of all kinds, beets, beans, potatoes, sweet potatoes, and in fact, anything which will grow any where from the Equator to the Arctic Circle.

5. This country is good for men with much or little means.

6. Country new and inhabitants scattering, but coming in pretty fast. I am twelve miles from the coast; from the postoffice five miles; have no school now, but expect to have this summer in the new Grangers' hall, which I am now building near the postoffice.

7. Don't know of any improved land with buildings for sale; unimproved land from $2 to $10 per acre. Government land for the taking up.

8. The same land needs irrigating for summer crops, not for grain or grass. The bees make honey nearly all, or all, the year round.

9. Cost of clothing about 25 per cent. above eastern prices. Flour $5 50 to $6 50 per barrel. Beef 5 to 6 cents. Will not pay to ship anything but bedding and clothes.

10. Society good.

11. Climate healthiest in the world. No cholera that I ever heard of. Very few poisonous reptiles. Once in a while a rattle snake may appear. I have killed four or five in the yard since I have lived here.

12. Rough lumber, red wood and pine, at $26 per thousand feet. Common red wood planed on one side, $28 to $30. Rustic, $45. Matched pine flooring and ceiling, $35. Surfaced red wood, $40. Bee hive lumber, $30. Nails, $5 50 per keg 8ds. Doors, $2 50 to $4. Windows, $2 25 to $6.

13. Hauling can be done for $10 per thousand feet. Climate so mild that a very cheap house will answer. Never any snow and but little frost. Never cold enough to need a coat on, except at night and when it rains.

Best Bee Location, etc.—R. J. Colburn, Chicago, Ills., writes as follows:

Seeing inquiries in the June number by Mr. H. B. Rolfe, about California as a location for an apiary, I would say, that being desirous of locating an apiary I have, myself, been on the look out for a place for some time past, and I investigated California among the rest, and I have come to the conclusion that Southern California is probably the greatest honey producing country, of equal area, in the world. I am further satisfied that its distance from good markets and liabilities to the disease known as "foul brood," as well as from ravages from the moth, may reduce the high estimate some people have of it. Again, there is just now a rush among the Eastern bee-keepers to Southern California; so much so that Mr. Harbison told me—on his recent visit to the East, when he marketed his gigantic crop—that where a few years ago he had no competitors near him, they are now so plentiful that he can hardly find a place to locate any new apiaries. His custom being to keep say from one to two hundred colonies in a place, and as fast as they increase, locate new ones.

In regard to the quality of California honey it seems to be the opinion of every person who has tasted it, with whom I have talked, that it cannot compare with our white clover, except in looks, "Novice" to the contrary notwithstanding. But its looks sell it. Again, I am of the opinion that the present season will see a drop in the honey market, as there probably will be shipped from California three quarters of a million pounds, and this with glucose so cheap, will materially reduce the profits of bee-keeping for Eastern apiaries. Look out for it, brother bee-keepers.

Pay as You Go.

The credit system is always attended with serious consequences, but it never resulted in such wide-spread disaster as at the present threaten. The credit system must at all times provide in some way for inevitable losses, and it does it by compelling the consumer to pay extravagant prices for everything he purchases and levying the debts of the unfortunate and dishonest upon the thrifty and honest. An unfortunate result, also, of being able to buy on credit is a tendency to purchase much that we do not need, and more than we need of what is actually necessary. When a man pays for what he gets at the time he gets it, there is little danger of his getting more than is absolutely necessary, and there is still less danger of his getting anything for which he is in no need.

The idea of turning a portion of the waters of the Colorado river from their present bed and cause them to run upon the lands of the Colorado Desert so as to reclaim it from its present waste and worthless condition, is a part of the plan of survey upon which Lieut. Wheeler is at present engaged.

The Horse.

Horses for Farm Use.

HALF the secret of doing good work lies in having good tools to do it with. In like manner the team which a farmer works has as much as aught else to do with his success or failure in farming. Our modern methods of farm management lessen the use of horses on one side by employing steam wherever practicable; but they immensely increase it on the other side by substituting horse-labor for that of men. Improved mowers and reapers for securing the hay and grain crops; improved cultivators nearly superseding the use of the hoe in cultivated crops, are the order of the day. It is no wonder that farmers are beginning to take decided interest in the horse business—not always in trotters for the race-course, but especially in good, strong-limbed and fast-walkers for the plow, the cultivator, the rake and the reaper. The higher price farmers have to pay for hired help makes it doubly important that it should not be neutralized either by inferior implements or teams. With some horses, six to seven acres a day is all that can be reaped or mown; while with others, twelve to fifteen acres are just as easily accomplished. It is discouraging to a farmer, and equally so to his hired man, to work hard all day and accomplish little through the inefficiency of his team. Work soon gets behind hand, and it costs twice as much, often more, to do work three weeks too late as to do it at the proper time.

What kind of horses do farmers want? This subject is a broad one. Most attention has been paid to the trotting and racing breeds; but these evidently are not the horses for average farmers. What they want is a horse strong enough for any kind of farm work, of good constitution, easily kept, and one that will readily learn a fast walk for ordinary farm work. The old Monroe County Agricultural Society, now the Western New York, did a good thing years ago in offering premiums for fast walking horses. There is no excitement in these trials of walking speed, but we opine that such premiums do more for the farmer than what Josh Billings calls the "purely agricultural hoss trot."

In our judgment, the Percheron horse, or some other strain of the Norman French breeds, makes the best basis for breeding a hardy, active and always healthy farm horse. In some sections these French horses have attained considerable popularity under the name of "Samsons," sometimes called "English Samsons," though the basis of the breed is rarely English. Their peculiarities are short legs, sound feet and heavy bodies in proportion to their size. The English or Scotch "Clydesdale" breed is generally too large-bodied, and too "loguey" to cross on our native mares. Possibly better results would be secured by taking Clydesdale mares and breeding with some of the heavier classes of American trotters. Theoretically, this should give all the strength and body required, with sufficient action and speed for all practical purposes.

A team weighing 2,100 to 2,250 pounds, closely built and well kept, will do the bulk of work on a hundred acre farm, as we know by experience. If more team help is needed get some more horses as nearly like them as possible rather than strive to get horses of unnatural size and proportions.—*Rural New Yorker.*

Horse-Racing at the State Fairs.

Among the abuses to which the State of California has become accustomed, is that which devotes large amounts for the encouragement of horse-racing at the State's annual Agricultural fair. We have no objection, whatever, to any reasonable encouragement of the breeding of good horses. And that horse-racing is one of the ways of encouragement for the improvement of racing stock, there can be no doubt. But does the hope of winning the stakes materially aid in the cultivation and breeding of good stock, such as the great majority of the people use, or have need of? We doubt it. It is the race-horse and fast trotter for which the stakes are offered, and it is the horse-jockey for whose benefit you and I, reader, are taxed to make up the stakes which go into his pocket. When the State, through its Legislature, offers premiums, or racing stakes, it is simply made a party to the violation of its own laws against gambling; for horse-racing is just as much gambling as is the betting at faro, monte or any other gambling game. Call it what you will, it is gambling, nothing less. So that while the State passes laws inflicting heavy penalties for playing games of chance, which it calls gambling, it offers large sums for the encouragement of gambling in another form, in which the horse is used instead of the cards, and the jockey takes the place of the dealer.

Manipulate the question as you please, plead improvement of stock, and all the rest of the flams used as arguments, it amounts to this: the State offers rewards for breaking its own laws; it encourages horse-race gambling at the expense of all its taxpayers. The horse-race calls together the gamblers particularly. It encourages betting, gambling, turbulence, a desire to obtain money without having rendered any consideration for it; and the race-course and the stand become the gambling hell out-doors of the gambling fraternity. And you and I, and every man who pays taxes, is assessed that the horse-jockey may win our money.

While the State does this, it takes away from our citizens who give their money and a portion of their time to military affairs, the miserable pittance formerly allowed them in part liquidation of their necessary expenses for Armories and other indispensable needs. How much better would it be to divert the money thrown away, and worse than that, in the encouragement of horse-racing and horse-gambling, and bestow it upon our public-spirited men, who, in times of peace prepare themselves for war, in accord with the advice of Washington. In the one case the money put up for the jockey to win, as the gambler wins on the turn of a card. In the other it would be given to men making themselves competent to defend the country against a foreign foe, or domestic violence. Abolish the premium on horse-racing bestow it upon the military.—*Alta, June* 14.

Horned Cattle at the International Exhibition.

The Centennial Commission proposes to adopt a scale to regulate the respective numbers of each breed of neat or horned cattle to be entered for competition.

It is assumed at 700 head will cover all desirable entries; and upon that basis will be calculated the number of stalls which will be apportioned each breed.

The scale divides the aggregate number into ten parts, and of these, four-tenth (4-10) are assigned to Short-horns, two-tenths (2-10) to Channel Islands, one-tenth (1-10) to Devons, one-tenth, (1-10) to Holsteins, one-tenth (1-10) to Ayrshires, and one-tenth (1-10) to animals of other pure breeds.

The exhibition in each breed will comprehend animals of various ages, as well as of both sexes. Draft and fat cattle will be admitted irrespective of breed.

The exhibition of horned cattle will open September 20th, 1876, and continue fifteen days.

It is desirable that all persons who contemplate exhibiting, will make application for stalls without delay, and if necessary at a later day such applications can be amended.

Inquiries may be addressed to the Chief of the Bureau of Agriculture, International Exhibition, Philadelphia.

Pisciculture.

The Growth of Salmon.

A HISTORY of the growth of the salmon from the small ova or eggs, may be interesting in this place. Each adult female salmon lays from 800 to 1,000 eggs to every pound of her weight. In their healthy condition, the eggs are generally of a pinky or amber color, with opalescent hues, semi-transparent, and exceedingly pretty in their effect. Sometimes, however, the eggs are very pale—nearly white in color; others, again, are of a bright coral red; but all that have a peculiar transparent iridescent hue are unmistakably healthy eggs. A tough, horny membrane is the "shell" which holds the embryo salmon and preserves it from injury. This external shell is exceedingly elastic; an egg dropped on the floor will rebound like an India rubber ball.

For a month or so no change is apparent in the healthy egg, as it lies in its bed of gravel in the running stream where it has been deposited by the mother, with the temperature or the water at about 45 degrees. The eyes of the fish appear in forty or fifty days; these may be perceived as two small, black specks; and in another three or four days a faint red line is apparent, running round the interior of one side of the egg, and in the centre a small red globule appears. The "thin red line" represents the vertebræ of the fish, just forming; and the red globule is a minute quantity of oil, which is destined to be absorbed by the fish after it comes out of the shell.

Gradually the faint indications of life within the semi-transparent shell become more marked till, about twenty days after the first appearance of the eyes, the fish bursts its prison. It now presents a most ludicrous appearance, with the lower side of its slender transparent body affixed to an oval sac which it carries wherever it goes. The vital organs of the fish can be distinctly seen; the pulsations of the heart are easily perceptible; and the rapid vibrations of the gills show that it is, for the first time, breathing just as an adult fish breathes. The empty "shells," as they float about in the water, showing the rent by which the young fish breaks its prison bonds, now appear like little bits of an India rubber air-ball, or portions of the white membrane found inside the shell of a hen's egg.

The fry are now "all alive," and as active as fish can be. Some of them will be found with their tails turned upward in an impudent manner; others bear their bodies in a becomingly staid longitudinal position; while others are strangely deformed. These unfortunates are unable to swim in a straight line, and can only turn round and round as on a pivot in one spot, lying all the time on their side, instead of swimming upright, and falling helpless to the bottom as soon as they cease their efforts at locomotion. These cripples generally die; though some of them, no doubt, arrive at maturity, as is proved by the instances—rare, it is true—of deformed salmon, with the backbone bent and crooked in various ways.

But the most curious instances of mal-formation are the fishy "Siamese twins." A double-headed creature is of frequent occurrence in a family of baby salmon, but these enormities seldom survive more than three or four days, though instances have been met with of a longer term of existence being given to these "monsters."

For some time after birth, the young fish do not seem to grow very fast; they are exceedingly active, and, though burdened with the umbilical vesicle, they swim swiftly about, rushing for a few seconds, and suddenly falling again to the bottom of the stream; they are unable to rest without touching the bottom.

The young fry do not require any food for

some time to come. The contents of the sac they bear about with them serves as food for the first six weeks of the salmon's life. The poor little fish has no mother to nurse it, so nature has provided it with a commissariat of its own. This vesicle or sac contains an albuminous secretion similar to white of egg, and a small globule of oil, the whole of which is gradually absorbed into the system. After six weeks of this self-sustaining process have elapsed, the outer skin of the bag appears to diminish in size, as the body of the fish increases.—*Chamber's Journal.*

The subject of pisciculture continues to attract public attention, numerous reports having been made by the state bodies since our last in reference to the subject. Among these we may mention the report of the Canadian government for 1874, and those of New Hampshire, New York, Massachusetts, and Connecticut. Operations looking toward the multiplication of the fishes of the United States have already been commenced, the United States Commissioner having been engaged for a month past in the rivers of North Carolina, Virginia Maryland and the District of Columbia in hatching shad and in turning the fry into the waters, as also in shipping a portion to localities destitute of them. The States of Maryland, Delaware and New York are also engaged at the present time in a similar undertaking.

Mr. Livingston Stone expects to resume his labors in procuring the eggs of California salmon on the Upper Sacramento for transmission to Eastern waters, and proposes a scale of operations looking towards the acquisition of ten millions of these eggs. It is probable that some of these eggs will be shipped to Chili for the purpose of determining whether the salmon can be successfully reared in the streams of that country, many of which, heading in the Andes, discharge their waters into the ocean, apparently possessing all the necessary conditions to constitute admirable places of abode for salmon. The United States Commission has already offered to deliver a sufficient number of eggs, properly packed in San Francisco, provided that their further transmission and subsequent hatching out are performed at the expense of the government of Chili. The offer will probably be accepted.

Mr. Stone has also paid a visit to the Columbia river for the purpose of studying the salmon fisheries of that stream, and to select a hatching station, should any provision be subsequently made for multiplying these fish artificially, to meet any anticipated decrease in consequence of the extensive scale of capture adopted on the Columbia to supply the various canning establishments.

An international exhibition of objects connected with the fisheries and pisciculture was held in Paris in July of the present year. Reference has already been made to the expectation of a similar exhibition of American fisheries at the Philadelphia Centennial, for which the general government and several of the States are making special provision.

Measures have been taken by the United States Commissioner of Fish and Fisheries for introducing the carp into the United States, by sending Mr. Rudolph Hessel, an experienced cultivator of this fish, to Hungary for the purpose of securing the best varieties. Opinions differ very much as to the excellence of the carp as an article of food, although it is claimed by its advocates that it is only in Eastern Europe, and in localities not often visited by Americans, that the best pieces are to be found. In any event, however, the fish is a desirable addition to our resources, as it ranks with poultry in point of domestication, and can be cultivated with very little trouble in almost any kind of water, thriving best in those which are warm, and thus eminently adapted to the Southern United States, where trout can be reared. As living largely on vegetable food, too, it becomes unnecessary to feed it with meat, or, indeed, to make any special provision for its nurture.

The American grayling still continues to be a subject of attention among pisciculturists, Mr. Fred Mather having recently made a second visit to the Au Sable river, in Michigan, and obtained a large number of spawn and of young fish. The eggs are now being hatched out at Northville, Michigan, and at Mr. Mather's establishment at Honeoye Falls, New York. The fish itself is not of any special economical importance; but as being one of great beauty, and readily taking the fly, it can be appropriately introduced into waters that are cold enough to receive it, and thus add, at least, to the resources of the angler. —*Harper's Magazine for August.*

Transporting Live Fish.—The London *Field* of a late date contains diagrams of an apparatus in use by the German Fisheries Association for transporting fish on long journeys, which consists of a long cask mounted on wheels, the motion of which works an aerating bellows, so that manual labor is dispensed with. There are iron or wooden tappets attached to the spokes by an open fork, and secured by a cotter, and when the wheels revolve the tappets strike upon and set in motion a swinging lever, and connecting wire attached to the lever works the bellows. Should it be desired to work the aerating bellows at a quicker rate, without increasing the speed of the vehicle, this can be done by adding to the number of tappets. The bellows can be worked by hand in case the apparatus remains stationary for any length of time, and the barrel can be easily removed from the frame at any time. It is a useful contrivance.

The Flower Garden.

Irrigation for Lawns.

The *Boston Journal of Chemistry*, in an article on "Making and Protecting Lawns," speaking of the dry and hot weather in New England the present season, says: "Grass plats, newly laid out, at much expense, in May, are now nearly ruined, and lawns look brown and sombre," and declares "that in such a climate no one can give advice that will serve to guide in the perfect preservation of lawns." Now, California is a drier climate on an average than New England, and right here in San Jose we can show the finest lawns in the world. The way they are kept fresh and green is by daily showering with water through sprinklers attached to hose under strong pressure. Water is first raised into high tanks by wind-mills, or is taken from the city water pipes. Many of the sprinklers are very ornamental and resemble fountains, but are movable, and will throw the water in any direction desired. Another way is to lay troughs under ground, a few inches deep, at a distance of several feet apart, and keep filled with water under a pressure, which will saturate the soil from below the turf.

By irrigation lawns can be kept fresh in spite of drouth, and in no other way can it be done. The time will come when the agriculturists east of the Rocky Mountains will resort to irrigation as a general system. Then they will have less failures, and will vastly increase the capacity of their soils, and thus add largely to the staple productions of the country.

The Love and Culture of Flowers. Nothing is so pleasant and encouraging as success, and no success quite so satisfying as success in the culture of flowers. It is a pleasure with no compensating pain—one which purifies while it pleases. We gaze on the beautiful plants and brilliant flowers with a delicious commingling of admiration and love. They are the offspring of our forethought, taste and care—a new, mysterious and glorious creation. They grew—truly; but very like the stars and the rainbow. A few short weeks ago the brown, earthy beds were bare and lifeless; now they are peopled with the fairest and frailest of earth's children. We have created all this grace; moulded the earth, the sunshine and the rain into forms of matchless beauty, and crystalized the dew drops into gems of loveliness. There is no greater pleasure than this in all the earth, save that sweetest and noblest of pleasures, the fruit of good deeds.

There may be hard-hearted, selfish people who love flowers, we suppose, for there were bad angels in heaven, and very unreliable people in the first and best of all gardens; but it has never been our ill fortune to meet with one such—and if by accident we should discover a monstrosity of this kind, we would be more frightened than we were a long time ago at what we thought a ghost sitting on a cemetery gate.

To love flowers, however, because of their sweetness and beauty and companionship, and as the wonderful work of a Father's loving hand, is what we mean when we speak of the love of flowers. Many cultivate flowers from a desire to excel their neighbors, or as an evidence of their refinement and culture, who know nothing of the absorbing love that causes a man almost involuntarily to raise the hat and bow the head in presence of so much heaven-lent loveliness. This love of flowers is confined to no age or station; we see it in the prince and peasant; it is shown by the aged father, tottering near the grave, who seems almost to adore the fragrant flower in his buttonhole, and by the little ones, who, with childish glee, search the meadows for the dandelions of early spring. The love of flowers, we fancy, is most pure and absorbing with the young. The innocent and pure can love the pure flowers, we think, with an earnestness and devotion unknown to some of us that are older.—*Vick's Floral Guide.*

Remove the Flowers.—The *Garden* says: All lovers of flowers must remember that one blossom allowed to mature, or "go to seed," injures the plant more than a dozen buds. Cut your flowers, then, all of them, before they begin to fade. Adorn your room with them, put them on your table, send bouquets to your friends who have no flowers, or exchange favors with those who have. On bushes, not a seed should be allowed to mature.

Recent scientific investigations appear to establish the fact that guano is not, as has been hitherto believed, the deposits of myriads of sea birds, accumulating through ages; but is the result of an accumulation of fossil plants and animals, whose organic matter has been transformed into a nitrogeneous substance. This view is substantiated by the fact that the anchors of ships in the neighborhood of the guano islands often bring up guano from the bottom of the ocean.

It is better to be flush in the pocket than in the face.

Stock Breeder.

The Improvement in Our Domestic Animals.

No branch of farming offers a better field for enterprise and careful expenditure of a small amount of money than the improvement of our farm stock, by the introduction of a few pure-blooded males, and females too, if the treasury will only admit of the expense.

About five or six years ago the subject of Short-horn bulls was introduced at some of our club meetings, the result of which was the purchase of one bull and two bull calves from Mr. Philip Tabb, who had at that time some very fine stock in Howard county, Md. The next season we had reported the sale of ten calves, averaging forty pounds more than from the same cows by a scrub bull; this alone gave a gain of $3 each on the sale of calves from the ten cows—quite a good interest on the first cost of the bull, which was $100. With most farmers in this part of the State the temptation of selling their calves is too great to resist; they will generally sell for nearly enough at six weeks old, to buy a two-year old steer or heifer, at the stockyards of Baltimore or Georgetown—of course the buying must be done at the dull time, in the fall of the year. A few, like myself, have some old fogy notions, and will raise a few calves, and lambs, too, even if they are worth more at six weeks than they will bring at one year old. Several other parties have since bought some thoroughbred bulls, of the Short-horn and Alderney breeds; from this small beginning we can now show more than two hundred young half-bloods of various ages. This will in a few years add very much to the value of our old native stock, both for beef and butter—all from a very small outlay of money for the first purchase of the thoroughbred males. Very many of our small farmers do not feel as if they could spare the necessary amount of money to make the first purchase. For such I would recommend that four or five living near should raise the necessary amount, by equal subscriptions, which would make the first cost seem much less, and all could derive the same benefit as by individual ownership. Or, what I consider much the best plan, is for one to own the animal and keep it at all times in the stable at his place, so that his neighbors will be sure to find him when needed, and charge them a reasonable price for service—say $1 or $1 50. At such a moderate price all will see that it is to their advantage to use a thoroughbred bull, as all his calves will be worth much more, either for the butcher or to raise; they will also be saved the annoyance of an unruly bull at all times on the place (except when he has jumped into a neighbor's corn field, or some other forbidden place). My own bull (a Short-horn) is kept up all the time, or nearly so, does not eat a peck of grain in a year, is in fine, thrifty condition on fodder, straw and other coarse food, with occasionally a little hay. By the above plan I get well paid for my investment and trouble of keeping the bull up, and my neighbors show that they are satisfied, as "sedge bulls" are a scarce article. I also have the satisfaction of seeing some good stock at home, and something to take a few prizes at the county fair, too.

I would recommend very much the same plan with hogs. One male will answer for several farmers; but be sure that he is a thoroughbred, of whatever breed you decide is best suited to your wants, and then do not rest satisfied with one pure crop, but continue to buy a pure blood to cross on the grade sows, so that the stock will be improving all the time. —*T. J. L., in American Farmer.*

Inflammatory Fever in Cattle.—To an inquiry from a correspondent about this disease the *Tribune* replies:

When young stock, especially calves, are subjected to a sudden change of feed, and from comparatively poor or rich sustenance, are put upon that of an entirely different character, the blood is at once affected. This altered condition is shown by fever, inflammation of the mucous membranes, especially about the eyes and the interior of the nose and nostrils, and a running from all of these. This frequently changes to stiffness of the limbs, with lameness and swelling. Afterward death is usually very sudden. The complaint is a blood disease, known as quarterill, blackquarter, inflammatory fever, anthrax, etc. It is seldom cured, but may be prevented. Caution should be exercised in changing feed. Cold, damp and excessive warmth should alike be avoided. Upon the appearance of the first symptom of disorder, a dose of salts (of six to eight ounces) should be given, followed by half an ounce of hyposulphite of soda, twice daily for a few days, administered in the feed or dissolved in water. A little linseed oil-cake meal should also be supplied each day. The disease may be communicated by means of a discharge from the nose.

Short-Horn Cattle.—In an interview with Mr. Wm. Curtis, a noted Short-horn breeder of Michigan, the inqury was propounded to him, Why is it you prefer the Short-horn, Mr. Curtis, to any other breed of cattle?

Well, sir, he said, I can very soon answer that question. Because there is more profit in them; there is more of them, you can get more out of them. The calves and young stock bring more money; they take on flesh faster. The cows give rich milk and the butter is rich. I know this, for I have tried Short-horns for years. They have no superior for beef. They make good working cattle. They combine more good qualities than any other breed. They cannot be improved by crossing with any other breed. Cross a Short-horn cow with a Devon or Ayrshire or Jersey bull, and you lose size. But the Short-horn improves everything it touches. It is the best known breed for improving native stock, and for this purpose alone they are valuable. They are kind and gentle, easily handled, good breeders and good mothers, hearty feeders, and I prefer them to any other breed. But I make no war on any other breed. They all have their good points, but the Short-horns, in my opinion, have the most best points.

Keep the Best Calves.—It is a common practice among our farmers to sell their best calves, and keep the poorest. This is not the true way, and they are reaping the disadvantages from so short sighted a policy. This selling to the butchers all the calves that fatten the quickest, and look the smoothest, is what has reduced the quality of the stock in this country.

Influence of the Male in Breeding. The Kentucky *Live Stock Record* gives its opinion on this topic as follows:

To improve the breed the question arises, whether the male or female plays the greater part in the proposed elevation of the herd. If a breeder wishes to perpetuate and impress the good qualities, and remove the defects of his breed, he must exercise the greatest care in the selection of the male and female. A single mis take in the selection of a bull will stamp qualities on his herd that will take years to eradicate. We believe the same rules that hold good in horses, hold with increased power in cattle. Although we believe the sire plays the most important part, and has more influence on the produce, the purity and good qualities of the dam are at least of equal consideration as the sire.

In reference to breeding horses, Gen. Daumas, a French officer, addressed himself to the Emir Abdel Kader. This was his reply: "The nobility of the father is most important. The Arabs greatly prefer the product of a blood horse and a common mare, to that of a blood mare and a common stallion. They consider the mother as having almost no influence upon the qualities of her produce. She is, they say, a vase which receives a deposit, and which retains it without changing its nature. Nevertheless, if race allies itself with race, there is not a doubt that the produce is good."

It won't do to depend solely on sires to improve the future condition of our horses or cattle; the mares and cows must be good also. We do not here speak of show cattle, running and trotting horses merely, but taking a more extended v[iew] of the subject, looking to th[e] tional advantage which the co[un]try derive from the improvement c[attle] of cattle and horses for general

It will be found in breeding cattle, horses, sheep or hogs, that the males parent chiefly governs the production of external character and structures, and very naturally the contour and action of the offspring, provided the male be of a superior or equally pure blood with the female; if not, the result will be uncertain.

From our observation in the human family, we have found, as a general rule, that the male children generally resembled their mother in the frontal and intellectual processes of the head, while the posterior portions partook of the father's characteristics. In the female child it is generally opposite, the upper and frontal processes resemble the father, the posterior the mother. It is crossing between animals evidently different in symmetry, proportions, characteristics and constitution, that has led so many breeders into difficulties and failures. But that differs greatly from crossing animals of homogeneons qualities. The best results have been experienced from that practice, when the object has been to influence the progeny of the female by the influence of a male of greater excellence.

In proof that the male parent governs the external form and character of the produce, we have only to look at the cross between the jack and the mare, and between the horse and jennet. In the first case the produce resembles the jack most, in the latter, the horse.

To milk a kicking cow stand off about eight feet and yell, "So, you darned skinflint."

Not Remarkable.—A Massachusetts farmer says: "My cattle will follow me until I leave the lot, and on the way up to the barn-yard in the evening stop and call for a lock of hay." Smithson says there is nothing at all remarkable in that. He went into a barn-yard in the country one day last week, where he had not the slightest acquaintance with the cattle, and the old bull not only followed him until he left the lot, but took the gate off the hinges, and raced with him to the house in the most familiar manner possible. Smithson says he has no doubt that the old fellow would have called for something if he had waited a little while, but he didn't want to keep the folks waiting for dinner, so he hung one tail of his coat and a piece of his pants on the bull's horns and went into the house.

Bunches in the Backs of Cattle.—A correspondent of the *Maine Farmer* says: Bunches in the backs of cattle are caused by the bot, or gad-fly, *œstrus bovis*. They may be peevented by procuring three ounces of pure carbolic acid, which can be obtained at any apothecary's, and diluting with one gallon of water; shake well, and place in a jug, keeping it closely stopped, and apply daily with a swab to the backs and sides of the young stock. Apply after the first of July, as it is about that time that the gad-fly appears.

In stock breeding no real advances have ever been made except by in-and-in breeding. The famous Vermont Merino sheep were produced in that way, and it is said that all the successful breeders of sheep in Australia have pursued the same course, and with the best results. While those imbued with the idea that stock deteriorated under close breeding and have spent much money to prevent it, have almost without exception ruined their flocks. No strain can become fixed except by close breeding.

"Too Poor to Take a Paper."

Moore, of the *Rural New Yorker*, was sitting in his office one afternoon some years ago, when a farmer friend came in and said:

"Mr. Moore, I like your paper, but times are so hard I cannot pay for it."

"Is that so, friend Jones? I'm very sorry to hear that you are so poor; if you are so hard run I will give you my paper."

"O, no, I can't take it as a gift."

"Well, then, let's see how we can fix it. You raise chickens, I believe?"

"Yes, a few; but they don't bring anything hardly."

"Don't they? Neither does my paper cost anything, hardly. Now, I have a proposition to make to you. I will continue your paper, and when you go home you may select from your lot one chicken and call her mine. Take good care of her and bring me the proceeds, whether in eggs or chickens, and we will call it square."

"All right, brother Moore," and the fellow chuckled at what he thought a capital bargain. He kept the contract strictly, and at the end of the year found that he had paid about four prices for his paper. He often tells the joke himself, and he never has had the face to say he was too poor to take a paper since that day.

The question of revenue must never stand in the way of needed reform.

Poultry Yard.

How to Keep Poultry.

A CORRESPONDENT, who, by long experience and continued success, knows whereof he speaks, sends the *Rural Press* the following on this subject:

The health of our chickens has always been in accordance with the house we gave them. Roup, pip, and other diseases have frequently put in an appearance, but by giving them plenty of vegetable diet and sulphur, they soon disappeared. Were the houses and yards are kept free from dirt and filth, there has never been any material loss; hence, this is the most important consideration. We make the houses tight up to within three feet of the eaves, and the balance is slatted. Roosting poles are placed from three to four feet apart, equal distance from the ground, so there will be no soiling of each other's feathers. The walls, outside and in, are whitewashed twice a year. Roosting poles and nest boxes are scrubbed with lye frequently, to destroy insects. If this is not found sufficient, fumigation with sulphur and tobacco is resorted to, which is certain death to all lurking insects and vermin.

A very important item is clear water, and an abundance of it. If a running stream can be provided, so much the better. The next thing is to provide a good wallowing place, and for this there is nothing better than dust gathered up in the road. Never keep more than fifty fowls in one enclosure. Give an occasional feed of meat. There is money in the poultry business, but not without labor and attention.

Lice on Fowls.—There are such a number of recipes for killing lice on hens that it is difficult to determine which is best. We use only one thing, and that is sulphur, and in the following manner: Whenever a hen takes a nest for sitting, fresh, clean hay is put under the eggs, and one tablespoonful of sulphur scattered over it. This will sift in among the hay, and the warmth of the hen will be just sufficient to cause slight fumes to arise and kill all the vermin which may be on the hen or in the nest. We have practiced this plan for the past twelve years, and neither a lousy chicken nor mother has ever been seen in our yard during the time named.

This is our preventive for lice on young chickens. Every spring we have our poultry house and roosts thoroughly cleaned and whitewashed inside, and then scatter flour of sulphur in every crack and corner and liberally over the floor. Do this and repeat it in the autumn, and we will venture to say that you will have no vermin on your fowls.

To kill the lice on the old fowls immediately, mix a little sulphur in lard and grease their heads with the compound, and put a little under each wing.

Sulphur is death to all kinds of lice, and not at all injurious to higher animals.

If scattered plentifully about barns and other out-buildings, it will destroy many kinds of vermin besides hen lice. We have had no "pip" among our chickens since we commenced the sulphur treatment.—*Rural New Yorker*.

A Model Hen Farm.—Of a hen farm near Marietta, Ga., the Atlanta *Herald* says: Laubere keeps his fowls in flocks of fifty. With these fifty hens are four cocks. To each flock of fifty he gives one acre of grain; i. e., he allows them the run of one-half acre this year and the other half next year, cultivating the unoccupied half acre every year. The farm, with its 800 occupants, occupies sixteen acres. Half of this is all the time under cultivation, so that only eight acres are really detracted from agricultural purposes. The farm lies pretty level, and is a beautiful sight; its regular succession of fences, its alternation of cultivated spots, its scores of shade and fruit trees, its hundreds of crowing cocks and clucking, matronly hens, make a picture worth going to see.

There is an egg on exhibition at Goggings drug store, opposite the plaza, that defies the genus of the hen kingdom, and completely sets at naught all former efforts of the genus hen to produce odities in their line. This egg has a moveable lid at its apex, one-half inch in diameter, leaving an opening in the shell of the same dimensions, from which its contents was pourred. The egg itself measures six and a half by seven and a half, and is the effort of a young Black Spanish fowl.—*S. V. Ag.*

Brahma vs. Black Spanish Hens.—A correspondent of the *Country Gentlman:* I have had as much experience with Brahmas and Spanish as any other variety, and I am confident that I can keep twenty Brahmas one year in good flesh with the same quantity of food that is required for twenty Spanish. Brahma chicks will attain a weight of six pounds each in the same length of time that a Spanish chick will attain four pounds. I can get as great a number of eggs in a year from ten Brahmas as I can from ten Spanish.

Porcine.

Breeding Better Pigs.

WE are glad to have a question from "a working man," as to how, without going into new-fangled breeds, he can make the best of his pigstyes, because, while the sneer at "new-fangled breeds" is a mistake, we hope wherever an interest in such things is felt, to be able to do some good in helping our readers to make more money out of what they keep, without the great expense many of them are so afraid of. And much may be done by any working man in pig breeding, if he will only use common sense.

Suppose, then, your present breeding sow is in pig—if she is not, you will of course put her to the best boar you can get—but we take her as she is, and her litter as it is, or is to be by-and-bye. The first thing you have to do is to watch that litter, especially the females. You will find a difference; some are more good-natured than the rest, and get on better on that account; all seems to come kindly to them. There will also be a difference in form, one carrying more flesh than another and of finer quality—not on account of a long, flabby belly, but because she is broad in the back and loins, has more barrel for her head and legs and so on. It is not rare to see one or two of a litter clearly ahead of the others. Now this good humor, this ample barrel, this greater quantity of good pork to offal, mark out such as your stock sows for the

future. Do your best with them, feed them well, and don't breed them till they are quite mature.

Before that time comes, find out who has the best breed in your neighborhood, not too unlike your own in size. Never mind the name, but find the man whose pigs grow fast, and fatten well and whose pork is best liked; he's the man we mean. Having found him, get if possible the use of his boar, either as a favor or for a moderate fee, if you possibly can. Don't mind so much about the fee; it will be the cheapest outlay you ever made, for we are not speaking of celebrated prize-winning strains (unless offshoots from them), but of good, well-bred, real quality animals that can be found within a moderate distance, and for a very moderate fee, almost anywhere. That one cross alone on your own best sows, will do a world of good.

But further, when you have selected the best of the offspring from this cross, use for them, if you can, another boar of the same sort. It is bad to go from one to another; whereas, by putting your own twice running to the same class of boar, from a good breeder you get better and better; and in this way, at almost no expense, you will ere long have got a much better class of occupants for your styes.

The rule is very simple; study to find out your own best, and keep on crossing them with the best you can get, always crossing from the same sort if possible, though it costs you trouble to find the boar you want. Only keep on twice to this plan, and you will find it pays so much better you will be sure to go right on of your own accord. The only objection is, if you keep on long enough, you will find you have got before you know it into one of the "new-fangled breeds." But you won't mind it by then. —*Live Stock Journal and Fancier's Gazette.*

The Berkshire Swine Record.—We learn that the American Berkshire Swine Association is meeting with hearty encouragement from many of the prominent breeders of the United States and Canada, among whom may be mentioned, as an indication of the wide-spread interest which the Berkshire Swine Record has already awakened, Messrs. T. S. Cooper of Pa., C. S. Taylor of New Jersey, John Snell Sons of Canada, H. M. Cryer of Ohio, and Theodore Eads of Iowa.

These and many others have expressed themselves thoroughly in sympathy with the work, and the very liberal support with which it is favored on every hand, encouraged the executive committee to believe they will be able to close the 1st valume by the 1st of August.

From a recent interview with Hon. A. M. Garland the Secretary of the Association, we learn that it has been decided to offer a premium of $100, for the best approved essay on the history of the Berkshire hog. In order also to call forth if possible, and to have permanently on record everything of importance that is known regarding the ancestry of such animals as are registered, it is proposed to allow to each patron, in the first volume, space not to exceed one page—at the mere cost of printing, for the purpose of giving a complete and detailed statement of all facts throwing light upon the past history of his stock.

It is evident the Association is determined to go to bed-rock for a foundation on which to build. The structure is not to be erected on uncertain sands. The establishment of a reliable herd-book for Berkshire swine has long been desired, but the element of reliability has always been deemed of such vast importance, and withal so difficult of attainment, that the task of founding such a work has heretofore never been undertaken. The almost universal response of encouragement from far and from near, throughout the country, shows that the day has come when such a work cannot longer be delayed. The very thorough manner in which the managers of the present enterprise are doing business, and the excellent plan for registers which has been matured, cannot fail to bring success, and to please all reliable breeders who want an authentic record. The decisive rejection of spurious pedigrees will make this already valuable and popular breed of swine more highly prized than heretofore, and will greatly assist farmers and stock-men in selecting animals best suited for the improvement of such stock as they already have.—*Prairie Farmer.*

Hog Cholera—Enteric Fever.—The period of incubation is from seven to fourteen days, but is less in a hot climate. Causes: Contagion, privation, starvation, confinement, filth, etc.

Symptoms: General ill health, shivering, fever, great dullness, prostrative fever, hides under litter, lies on belly, weakness of hind limbs, and later of the fore limbs, rapid, weak pulse, dry snout, covered by blood-stained spots, which also cover the skin, eyes, etc., often a hard cough, little or no appetite, intense thirst, tender abdomen. After death, blood staining infiltrations into lungs and bowels, ulcers on bowels.

Treatment: Give cooling, acid drinks, buttermilk, sulphuric acid, etc.; feed soft, mucilaginous food, such as oil cake. Administer twenty drops of perchloride of iron twice a day. Blister the abdomen by means of mustard and turpentine; stimulate if very prostrate.

Prevention: Avoid all debilitating conditions, poor or spoiled food; keep animals constantly thriving. Feed charcoal or ashes, also tar or carbolic acid. Avoid contact with disease. Burn infested pigperies and remove to a new place.—*Prof. James Law.*

Hygienic.

Does the Use of Flour Promote Decay of Teeth?

BY EPHRAIM CUTTER, M. D.

THERE is no doubt that the decay of teeth prevails to an alarming extent, and it is very humiliating to our modern civilization to have it characterized so generally by the occurrence of diseased teeth. The ætiology of this disease is a great, broad, and deep subject. No doubt many elements combine together to cause it; and the person who should positively announce a single agent would be dismissed as unworthy of attention. Still it is a matter worth discussing, and deserving the attention of the ablest minds. To ignore is not to arrest; hence we offer a few suggestions for consideration.

"The *Chemical News* ascribes the potato rot to a deficiency of lime and magnesia in the soil. Different observers state the percentage of magnesia in the ash of sound tubers at from five to ten per cent.; in the diseased tubers an analysis shows only 3.94 per cent. Analysis of sound tubers shows over five per cent. of lime, but in the ash of diseased tubers only 1.77 per cent. was found. A similar observation was made some years ago by Professor Thorpe, with regard to diseased and healthy orange trees; in the former there was a deficiency of lime and magnesia."

According to these authorities, a deficiency of mineral salts in the vegetations named is supposed to be a sufficient cause for decay. Now, it is an interesting question whether there is any article of food employed by mankind which is deficient in mineral matter. If so, then it should be made known to every family in the land.

Perhaps there is no article of food more generally consumed than flour, that is, wheat flour. In the forms of bread, cakes, and pastry of all kinds, it enters into every house, and is universally used and regarded as the "staff of life."

Does flour possess a requisite amount of mineral matter?

To answer this question, Mr. Sharples, the well-known chemist, analyzed for me the "Peerless Flour." He found .55 per cent. of mineral ash, a little over half of one per cent. He stated also that the proportion of ash in the whole grain varied from 1.65 to 2.50 per cent. So that the diminution of mineral food varies from two-thirds to four-fifths. In other words, by the use of flour, mankind loses from two-thirds to four-fifths of the elements that go to make up teeth and bony structures. This statement deserves to be written in letters of gold over the door of every bakery and kitchen in the land.

Flour has been used for generations, and if we can rely upon Mr. Sharples' statement, mankind has all this while been deprived of the greater moiety of the mineral food that the Almighty intended it should have the benefit of. Is it not natural to expect that the bony structures should suffer from this great withdrawal? For it is a *great* withdrawal. Suppose that a water supply pipe should be cut off two-thirds to four-fifths, would not the supply be greatly diminished? Cut off the same quantity of time from the hours of daylight; and would not our darkness be great? Take away two-thirds to four-fifths of our muscular food; would not a strong man become very weak? Cut off air to the same extent; would we not lose our breath? And why should the bony tissues not suffer in like manner when their food is withdrawn? I think they do. Perhaps a little evidence in the contrary direction may throw light upon this.

A dentist, whose name is well known, said that he filled some fourteen cavities in the teeth of his first-born child by the time he was four years of age. He put his family upon the use of the whole grains, and the next child had no retarded dentition, and not a decayed tooth up to the same age!

The same gentleman says that the teeth which decay are not compacted or knit together with the firmness of healthy teeth. There seems to be an arrest of perfect development. Though what can be more natural than to expect imperfect development and decay, when from two-thirds to four-fifths of the proper bone food is habitually withdrawn from an article of diet which is more largely used than any other?

How common it is to see infants not cutting any teeth at all, until they are twice as old as they ought to be. The good effect of the whole grain diet is shown in Dr. Harriman's second child, above alluded to. To be sure, it is only *one* case, and must not be made too much of.

Now what is to be done about it? Certainly one man's dicta amount to but very little alone. What we need is evidence from others. Suppose that every medical association of the country take up this matter, have analyses of flour made, try feeding mothers and children upon the whole grains of wheat meal, oat meal, corn meal, beans, etc., and suppose they all come to the same conclusion as the writer has done. Suppose they officially announce the result. Would it be long before the general public would heed the truth, and thousands of persons would rejoice in the

possession of that priceless treasure, a set of perfect teeth?

Note: Through the kindness of Mr. E. H. Davis, Superintendent of Public Schools in Woburn, Mass., the writer has been furnished with the following astounding statistics, embracing returns from several of the largest primary schools of Woburn, a fair representation of the prevalence of diseased teeth among children:

	No. Scholars.	With Sound Teeth.	Decayed.
Lawrence Primary.....	113	14	100
Plympton St. Primary.	94	27	67
Hiniand St. Primary...	71	25	46

What Smoking Does for the Boys.—A certain doctor, struck with the large number of boys under fifteen years of age whom he observed smoking, was led to inquire into the effect the habit had upon the general health. He took for his purpose thirty-eight boys, age from nine to fifteen, and carefully examined them. In twenty seven of them he discovered injurious traces of the habit. In twenty two there were various disorders of the circulation and digestion, palpitation of the heart, and a more or less marked taste for strong drink. In twelve there was frequent bleeding of the nose, ten had disturbed sleep, twelve had slight ulceration of the mucous membrane of the mouth, which disappeared on ceasing from the use of tobacco for some days. The doctor treated them all for weakness, but with little effect until the smoking was discontinued, when health and strength was soon restored. These facts are given on the authority of the *British Medical Journal.*

Spectacles become necessary when you first notice yourself going to the window instinctively for a better light, or when your eye gets tired by looking at any small thing near at hand, or a dimness or patering is manifested, so as to cause indistinctness. First purchase No. 20, and as you observe the symptoms above named, get No. 18, and so on. Glasses should be near enough to the eye almost to touch the lashes; they should be washed every morning in cold water, and carried in a pocket by themselves. Brazilian pebble makes the best lenses. Avoid reading before sunrise and after sunset. Read as little as possible before breakfast or by artificial light; do not sew on dark material at night, and use no other eye-wash than pure, tepid, soft water. Babies' eyes are often injured by allowing the glaring sunlight to fall upon them.

Cure for a Felon.—As soon as discoversd, take some spirits of turpentine in a cup, dip the finger in it, and then hold the hand near a hot fire till dry; then dip it in again, and repeat for fifteen minutes, or till the pain ceases. The next day, with a sharp knife, pare off the skin, and you will find something like a honey comb filled with clear water, open the cell and the felon is gone. If the felon is too far gone for turpentine, oil of origanum, treated in the same way will cure. If too far advanced for either to cure, the felon will be benefitted, as it will be less painful. Never draw it.

Burns and Freezes.—Whatever is good for one is just as good for the other. Cold water or snow will remove the first fire or cold, then essence of peppermint, or a strong solution of alum water will harden the skin and draw out the pain. Great care should be taken with burns or freezes, not to break or rack up the skin; and never put on drawing poultices, it makes a big sore. A cloth with a little mutton tallow or some soft oil spread upon it, will keep out the air and heal it where the skin is torn up.

Abstinence from low pleasures is the only means of meriting or of obtaining the higher. Kindness in ourselves is the honey that blinds the sting of unkindness in others.

Educational.

"What Shall We Do With Our Daughters?"

MRS. LIVERMORE has made this query the text of one of her fine lectures. It is certainly an important problem, but the Davenport *Democrat* thus sums up some sensible lessons which should early be impressed upon them:

Teach them self-reliance.
Teach them to make bread.
Teach them to make shirts.
Teach them to foot up store bills.
Teach them not to wear false hair.
Teach them to wear thick, warm shoes.
Bring them up in the way they should go.
Teach them how to wash and iron clothes.
Teach them how to make their own dresses.
Teach them how to cook a good meal of victuals.
Teach them that a dollar is only a hundred cents.
Teach them how to darn stockings and sew on buttons.
Teach them everyday, dry, hard, practical common sense.
Teach them to say No, and mean it; or Yes, and stick to it.
Teach them to wear calico dresses and do it like queens.
Give them a good, substantial, common school education.
Teach them that a good, rosy romp is worth fifty consumptives.
Teach them to regard the morals and not the money of their beaux.
Teach them all the mysteries of the kitchen, the dining-room, and the parlor.
Teach them that the more one lives within his income the more he will save.
Teach them to have nothing to do with intemperate and dissolute young men.
Teach them that the farther one lives beyond his income the nearer he gets to the poor-house.
Rely upon it that upon your teaching depends in a great measure the weal or woe of their after life.
Teach them the accomplishments, music, painting, drawing, if you have time and money to do it with.
Teach them that a good, steady mechanic, without a cent, is worth a dozen oil-patent loafers in broad-cloth.
Teach them that God made them in His own image, and no amount of tight lacing will improve the model.

Begin Right.

It matters little what the employment is upon which you are about to enter, whether we go into the offie, the workshop or upon the farm, it will be well for us to remember that as we commence the work to be accomplished, so will we be likely to carry it through to the end. The bookkeeper who goes into the office to work for a year, and allows himself to be careless and his accounts to become confused, will never recover. At the end of the year, when customers come in to settle and compare accounts, the negligent accountant will learn that many little items left over just for the present were never recorded, and the dissatisfaction arising from such negligence is likely to cost him his position in the office, which must be filled by a man who has learned to perform the work assigned him carefully and promptly.

Upon a farm, most especially, the work is varied, and the time at which many of the tasks should be performed so arbitrary that, if we court success at all, we must learn to do everything at the right time. This cannot be done if we go on in a sort of haphazard way, making no plans to-day for the work of to-morrow, but we must have our course carefully mapped out. There are farmers all over the country who cannot to tell where they will plow—what or where they will plant or sow. They only know that they will turn over a piece of sod somewhere for corn, put in a little patch of potatoes some other place, and sow a few oats if they conclude where to put them. Is it any wonder that such men are always in a hurry, always behind with their work, always put their crops in late, complain that it is a backward season and that their corn was cut by the frost before it was ripe, and that their potatoes are rotting for want of time to dig them? Are there not good and sufficient reasons why the wind throws down their unstaked fences, that their stock is unruly and always doing damage, that their orchards bear none but unmarketable fruit, that their meadows yield nothing but wild grass for want of draining, and that the roofs of farm buildings are always leaking? Is it a problem difficult to solve why their mowing machines are continually breaking down, their harness giving out, and cattle, sheep and horses dying of disease? It is all because this class of farmers allow their work to drive them. They lay no plans. and do everything a little too late. They are forever "dragging the cat by the tail." Such men ought to be compelled to work for a year or two under a careful, methodical farmer, and made to know what it is to accomplish a great deal and to do it easy and well. As an illustration of the success (or failure rather) of those men who are negligent in the important details of farm work, I will mention one instance which has just been brought to my notice. A farmer residing in a county adjoining that in which I live, having read one of my letters concerning root crops, determined to follow the advice given, and put in one acre of carrots. After having drilled in the seed he left the crop to itself until the weeds had become so thick that he could not find the little plants upon which he had, at their first appearance, built visionary supplies of yellow roots. But not completely discouraged by the first failure, he plowed the ground again and put in turnips. But negligence again stepped in and robbed him of the reward of his labors. Weeds were again allowed to get the advantage, and as a last resort he sowed Hungarian grass, which, being put in late, was killed by the drouth, and thus ended his first experience in raising root crops. Had he laid his plans the year before, and plowed and harrowed the ground for roots repeatedly, making the weeds grow and then killing them, he would have been able to report a far different result.—*C. T. Leonard, Ohio Farmer.*

Science on the Farm.

What has science to do with farming? Probably nothing, probably much. With what does he deal? Soils, grasses, vegetables, cereals, life, animal and vegetable, manures, etc. What do these require? Intelligence, a knowledge of their merits, their conditions, adaptabilities, the laws which govern them, and their constituent elements. As science is only knowledge reduced to practice, is it not required on the farm? The structure of plants is in itself a beautiful and useful study, and one that should be well understood by each person who deals with them, and their constituent elements and the food necessary for their growth and highest perfection. In order to obtain the best results from land it is

a requisite that we know what it will produce in the greatest quantity and perfection at the least cost. Some lands are best adapted to grazing, others require to be tilled and planted; hence, a knowledge of soils becomes necessary. The different vegetables require different foods, different climates and different soils; they feed on different elements, and what will make one species thrifty will not bring another to perfection, and these differences must be considered and met in order to insure success. Animals, in order to be bred properly, must be watched and cared for in accord with the laws of their nature, and those laws must be known and understoon, to be successful. No ignorant man or quack can successfully handle the principles of life and being. If we wish to apply manure we must know when, how, at what time and place, and its constituents. Of course, most plants will derive some good from any manure, but to apply it successfully, that is, understandingly, insures against waste. What can we cultivate with most profit to ourselves, is the great question, and the other is like it, How can we cultivate most economically?

There are those who shudder at the word science, as they suppose it means technicalities and a list of terms, but it is not so. Observation, reading and experimenting can make a man practically scientific, even if he disowns the name, and it is this science I would plead. Go into the world with eyes and ears open, and senses awake. Study to learn and learn to excel. All knowledge of material things aids the farmer. Many will not inquire for fear they may be misled, but good common sense is the stomach to digest all information, and it is not a requisite of success to swallow all that comes within reach like an unfledged robin. Reason must be brought to bear on the laborers of the farm as well as on any other calling of life. Prize all things, but learn to do what you try in a methodical and intelligent manner.—*F. G. McCauley.*

Facts From Farmers Wanted.

The importance of having practical writers for an agricultural paper, men who write from experience and not mere theories, cannot be over-estimated. In the struggle which usually attends the farmer's life, he too often forgets the great good he could confer by communicating more or less of his experience, including many years of close observation, to the columns of the leading agricultural journals published in the section of country in which he resides. This would be much more satisfactory to all concerned, than to be constantly complaining that the writers for agricultural papers are not, as a general thing, practical farmers.

Such men forget that our present knowledge is the sum of our own experience and the recorded facts based on the experience of others. They forget that it is to the thinking men as well as the working men, that we are, in the main, under obligations for the progress of agriculture. It is not only to practical farmers, but to men of scientific attainments, as Liebig, Johnston and others, that progressive farmers are under lasting obligations.

It will not do to set up the claim that success depends upon brute force alone, or that no agricultural paper possesses a cost value in timely hints or as a record of experiments, because, forsooth, its pages are not wholly made up of the writings of successful farmers, who are so engrossed with their duties on the farm that they never take the time to express their view on paper.

We are prepared to admit that every farmer must be governed more or less by the results of his own experience, or, in other words, he must be a law unto himself; yet it does not follow that he can derive no benefit from the experience of others whose farms are unlike that of his own in many respects.

The Best Education.—Edward Everett, the gifted orator, never spoke more truthfully than when uttering the following words: "To read the English language well, to write with dispatch a neat, legible hand, and to be master of the first four rules of arithmetic, so as to dispose of at once, with accuracy, every question that comes up in practice—I call this a good education. And if you add the ability to write pure grammatical English, I regard it as an excellent education. These are the tools. You can do much with them, but you are helpless without them. They are the foundation; and unless you begin with these, all your flashy attainments, a little geology, and all other ologies and osophies, are ostentations rubbish."

It is too generally the custom among the schools of to-day to neglect these so-called "common branches." They omit the foundation, and build up a vast and imposing structure of showy accomplishments. No sooner does a pupil of one of these schools attempt to enter upon the busy scenes of life, than he finds this "castle in the air," built at so great a cost of time and money come tumbling down about his ears.

It is in part to the business college that we must look for a remedy for this state of affairs. These schools, when properly conducted, lay the foundation firmly by imparting thorough instruction in all the more useful branches of an English education. Then the structure built thereon in not merely ornamental—it is massive, and it has a look about it of commercial utility, suggesting the scenes of a busy and useful life in the arena of business. The lessons there imparted have special reference to the practical affairs of life. They teach the pupil how to make himself useful in any capacity, and how to earn his living honorably. They impart to him confidence in his own abilities, through use of them while at school, and furnish him with the tools with which he must work out his success in his after cares. These institutions have been of great assistance to the aspiring young men of our country, and hence their remarkable popularity.

Tropical Plants for Ornamental Purposes, etc.

Among the great variety, I would mention some of the palm family, and first, the corypha Australis, or in common parlance, the Australian cabbage palm; the Cycas revoluta, or sago palm; the foliage is most graceful. Isaboea spectabilis produces a sweet syrup called palm-honey used for domestic purposes. The nuts are used by confectioners, and by the boys as marbles. The leaves are employed for thatching roofs, etc., whilst the trunk, which is hollow and very hard, is converted into an excellent water pipe for the purposes of irrigation, etc.

But the most available tree for ornament and use, with which I am familiar, is the celebrated Bahia, or Naval Orange, the king of oranges, without pulp or seeds, smooth and thin-skinned, the flavor most delicious. And last, but not least, is the Passaflora or Granedillis, the Garabalda and Chinese Peach, the former of which is not only graceful as an ornament but produces abundance of fruit every month in the year—in this respect like the Naval Orange. The smaller variety is the best fruiter, and resembles strawberries and cream. It also forms a delightful shade for balconies, verandahs, or out-houses, etc., being one of the greatest runners, and will make its way over the house top, if allowed so to do.—*Wm. Hobbs, in Los Angeles Express.*

Several fruit-dealers in Portland, Me., are sending apples to Europe, receiving twelve dollars a barrel.

Household Reading.

Love Lightens Labor.

A GOOD wife rose from her bed one morn,
And thought, with a nervous dread,
Of the pile of clothes to be washed, and more
Than a dozen mouths to be fed.
There were meals to get for the men in the fields,
And the children to fix away
To school, and the milk to be skimmed and churned;
And all to be done that day.

It had rained in the night, and all the wood
Was wet as wet could be;
There were puddings and pies to bake, besides
A loaf of cake for tea.
And the day was hot, and her aching head
Throbbed wearily as she said,
"If maidens knew what good wives know,
They would be in no haste to wed."

"Jennie, what do you think I told Ben Brown?"
Called the farmer from the well;
And a flush crept up to his bronzed brow,
And his eyes half bashfully fell.
"It was this," he said, and coming near,
He smiled—and stooping down,
Kissed her cheek—"'twas this: that you were the best
And the dearest wife in town."

The farmer went to the field and the wife
In a smiling absent way,
Sang snatches of tender little songs
She'd not sung for many a day.
And the pain in her head was gone, and the clothes
Were white as the foam of the sea;
Her bread was light and the butter was sweet,
And as golden as it could be.

"Just think," the children all cried in a breath,
"Tom Wood has run off to the sea!
He wouldn't, I know, if he only had
As happy a home as we."
The night came down and the good wife smiled
To herself as she softly said
"'Tis so sweet to labor for those we love,
It's not strange that maidens will wed,"

Letter From Nell Van.

My dear "Snip," your "Familiar Talks" in the July number of the Agriculturist sounds much too sensible and practical for one bearing so flippant a cognomen; still, we will not quarrel about that, since a rose by any other name is as sweet. I have been reminded that the name I bear (which answers my purpose well enough) is too undignified for the matronly advice offered so quaintly at various times to the readers of this charming little household journal.

Your useful suggestions are doubtless being put in practice all over the State by many a young house-keeper, and thoughtless old one, who, like myself, feel glad of any improvements in the kitchen department.

As an interchange of thought is often desirable, and as we may never meet and become acquainted other than through these columns, I will offer a few of my own house-keeping experiments.

Carpets will wear and preserve their beauty twice as long if, when beginning to show signs of wear, they be ripped apart in the center and the two outer seams sewed together.

Stair carpets should be taken up as often as once in two months, shaken, and slipped so that the edge of the stair comes in a new place. To do this, it is necessary to buy the carpet a yard or so longer than needs, and the difference in the wear of the carpet will more than compensate for the extra expense.

Many good house-keepers always put straw underneath their three-plies and ingrains, but I find thick paper, or several thicknesses of newspaper, quite as good, and always use it under all my carpets for it keeps out cold and dampness.

To clean paint, put a teaspoonful of ammonia into a quart or more of blood-warm water, and the finger marks and fly specks

will vanish as if by magic if applied with the softest cloth.

Those troubled with ants in their pantries may rid themselves of the torments by getting a dime's worth of corrosive sublimate and put in a common spice bottle with alcohol to dissolve it, and fill the cracks along the wall of each shelf, and wherever the vermin may gain a foothold. It saves the necessity of plates of water for sugar-bowl and such things and only needs renewing once a year.

Santa Cruz, July, 1875.

Taking It Coolly.

Mrs. Kate Hunnibee says: One of the most disagreeable companions on a hot summer's day is a hot stove, and yet how many women who read the article feel compelled to spend many hours out of every twenty-four with this black, fiery kitchen partner. Is there no escape? Suppose the kitchen door opens on an ample porch, with a roof over it, and a honeysuckle in front of it, or a grape-vine, or a hop-vine, or morning-glories, or flowering beans clambering up a trellis and shutting out the ardent rays of the sun. What a nice place that would be for carrying on the various activities of a summer's morning. One could wash there, spread the ironing table beneath the growing grapes, set the dinner table there, shell peas, stone cherries, and do a thousand other things in the open air while keeping an eye on all that goes on in the kitchen. If there is but a step from the house to the ground, two or three larger trees just at the door are better even than a porch. We lived in such a kitchen once, and spent all the pleasant summer days in the open air. The cradle had a little awning over it, there was no clatter of shoes on the grassy sod beneath no slops on the floor, no furnace heats, nothing but rural peace and quiet shade.

It does not occur to a great many women that there is any better or easier way of doing than the one to which they have become accustomed. The tendency of housework is to settle into a fixed routine and wear deep ruts, to go out of which is no easy matter. But it is not a bad plan to start inquiries in every department of domestic industry, and try experiments until one finds out the easiest way of accomplishing the matter in hand. In the winter, of course, the nearer the ironing and baking table is to the stove the fewer steps will be required, but this is not the first consideration in Summer, and if one will have a high chair to sit in while ironing or baking on a low table, the distance from the stove will not amount to much. Beside, children of five and six years old can be taught to take steps.

There is another matter not very well understood by American cooks. We use entire too much fuel; we cook by too hot a fire, we eat too much hot food, we boil our soups and vegetables furiously, when all we want is to raise the temperature of the liquid in question to 212°, which can be done with a moderate fire and no inconsiderable saving of stove-lining, coal, and physical discomfort. It is calculated that one-third of the power generated in any machine is consumed in overcoming the friction, and one great problem with machinists is to reduce the friction to its minimum. Let us apply this problem to housekeeping, and begin by studying all the ways in which we can keep cool.—*N. Y. Tribune.*

Profit of Marrying.—Here is what an old Kentucky farmer says about his wife:

I have been married twenty-two years. The first four years before I was married I began farming with two hundred and fifty acres, in Blue Grass region, Kentucky. I handled cattle, hogs, sheep and horses—principally the first too named—and lived, I thought, tolerably economically; spent none of my money for tobacco in any way; neither betting a cent or dissipating in any way, and yet at the end of four years I had little or no money. I then married a young lady of eighteen years of age—who had never done any housework or work of any kind except to make a portion of her own clothes. She had never made a shirt, drawers, pants or waistcoat, or even sewed a stitch on a coat, and yet before we had been married a year she had made for me every one of the articles of clothing named, and knit numbers of pairs of socks for me—yes, and mended divers articles for me, not excepting an old hat or two. She had also made butter, sold eggs, chickens, and other fowls, and vegetables to the amount of near six hundred dollars in cash, at the end of the year, whereas, during the four years that I was single, I had never sold five cents' worth—besides making me purely happy and contented with my home. And so far as to making of money, we have made money clear of expenses ever since we have undertaken the farm, and she has made three hundred and fifty to five hundsed dollars every year except one, during the time, selling butter, eggs, and marketing of different kinds. My yearly expenses of fine clothing, etc., before I was married were more than my yearly expenses were after I was married combined with the expense of my wife and children; and our farm has increased from two hundred acres; and I believe that if I had not married, it never would have increased but little if any; and I have never been absent from home six nights, when my wife was at home, since we were married, and her cheeks kiss as sweetly to me as they did the morning after I was married.

Engaging Manners.—There are a thousand pretty engaging little ways, which every person may put on without running the risk of being deemed either affected or foppish. The sweet smile, the quiet, cordial bow, the earnest movement in addressing a friend, or more especially a stranger, whom one may recommend to our good regards, the enquiring glance, the graceful attention which is so captivating when used with self-possession—these will insure us the good regards of even a churl. Above all there is a certain softness of manner which should be cultivated, and which in either man or woman, adds a charm that almost entirely compensates for lack of beauty. The voice can be modulated so as to intonate that it will speak directly to the heart, and from that elicit an answer; and politeness may be made essential to our nature. Neither is time thrown away in attending to such things, insignificant as they may seem to those who engage in weightier matters.

Very True.—Some one has well said that "parents who spend money judiciously to improve the house and grounds about it, are paying their children a premium to stay at home and enjoy it; but when they spend money unnecessarily on fine clothing and jewelry for their children, they are paying them a premium to spend their time away from home—that is, in places where they can display such ornaments."

A Happy Home.—In a happy home there will be no fault-finding, over-bearing spirit; there will be no peevishness or fretfulness. Unkindness will not dwell in the heart or be found on the tongue. Oh, the tears, the sighs, the wasting of life and health and strength, and of all that is most to be desired in a happy home, occasioned merely by unkind words! A celebrated writer remarks to this effect, namely, that fretting and scolding seem like tearing the flesh from the bones, and that we have no more right to be guilty of this sin than we have to curse and swear, and steal. In a perfectly happy home all selfishness will be removed. Its members will not seek first to please themselve, but will seek to please each other. Cheerfulness is another ingredient in a happy home. How much does a sweet smile, emanating from a heart fraught with love and kindness, contribute to make home happy. At evening, how soothing is that sweet cheerfulness that is borne on the countenance of a wife and mother! How do parent and child, the brother and sister, the mistress and servant dwell with delight upon those cheerful looks, those confiding smiles that beam from the eye and burst from the inmost soul of those who are dear and near! How it hastens the return of the father, lightens the cares of the mother, renders it more easy for youth to resist temptation, and drawn by the chords of affection, how it induces them with lowly hearts to return to the yaternal roof. Seek then to make home happy.—*Ex.*

Show and Parade.—We find the following floating among our exchanges, and it strikes us as being worthy of being read and pondered by all:

The world is crazy for show. There is not one, perhaps, in a thousand, who dares fall back on his real, simple self for power to get through the world and exact enjoyment as he goes along. There is no end to the aping, the mimicry, the false, airs, the superficial airs. It requires rare courage, we admit, to live up to one's enlightened convictions in these days, unless you consent in the general cheat, there is no room for you among the great mob of pretenders. If a man desires to live within his means, and is resolute not to appear more than he really is, let him be applauded. There is something fresh and invigorating in such an example, and we should honor and uphold such a man or woman with all the energy in our power.

Despondency.—What is the cause of spondency? What is the meaning of it? The cause is a weak mind, and the meaning is sin. Nature never intended that one of her creatures should be the victim of a desire to feel and look the thunder-cloud. Never despond, for one of the first entrances of vice to the heart is made through the instrumentality of despondency. Although we cannot expect all our days and hours to be gilded as sunshine, we must not, for mere momentary griefs, suppose that they are to be enshrouded in the mists of misery, or clouded by the opacity of sorrow and misfortuno.

A Milanese lady, after long study and toil, has invented a process to spin the gossamer threads from cold cocoons, which affords considerable advantages on the old method of using heated water, viz.: less space, no coal, less trouble for the spinner, and greater strength in the silk obtained.

SAN JOSE INSTITUTE AND BUSINESS COLLEGE.

San Jose may well be proud of its educational privileges, and of no one school more than this Institute and Business College. Mr. Kinley, who has lately become proprietor of this school, is an experienced educator, and under his superintendence it will not be likely to lose any part of its well-earned reputation as a first-class institution of learning. We have often referred to this school, and feel it is worthy of the attention of all who design giving their children a practical education. It is to such institutions as this that we must look, in a great measure, for a remedy for the imperfections in our public system of education. To be educated to advantage, it is not enough that we understand the theory, we must have the ability to apply what we have learned. This is the object of the business college. The course of instruction in our San Jose Institute seems to be complete in the various branches. The school offers many advantages, and although it is graded, students may, at any time, pass into higher grades in any branch, if on examination, they are found qualified to do so. Persons who are early education has been neglected may receive special instruction without the annoyances of public schools. Throughout the whole course of study two fundamental purposes are kept constantly in view: the mental and moral growth of the student, and his qualification for the labors and duties of life. Mr. Kinley hopes to be able to add an agricultural department to the school in a short time, and to make the institution worthy the interest and patronage of the public. Mr. Vinsonhaler is still principal of the business department to which he devotes his entire attention. There is no vacation to his department. This gives the pupils a chance at any time to continue their studies.

Conifera of the Pacific Coast.

J. Begg, of Gilroy, has been making a collection of the different conifera of this coast, for the Centennial Exhibition at Philadelphia. He has already been at the work for several months, and collected over 2,500 specimens. He intends making a structure thirty-five feet high and twenty-five feet in diameter. The base will be octagon in shape, with arches twelve to fourteen feet high, and decorated with the cones and foliage of the different species of evergreen trees, forming an entirely unique exhibit—different from anything ever presented to the world before. The base of the structure will be a repository for the exhibition of California. He has correspondents collecting in different parts of the coast. The captain of the Alaska Fur Company's vessel cruising in the Northern Ocean and the Aleutian Islands has promised to make a collection, and gentlemen interested in the matter in Alaska and British Columbia are also assisting. Mr. B. would be glad if any one having fine specimens of cones, or being in a vicinity where such could be obtained, would send them in to him, care of W. J. Turnbull, Sansome street, San Francisco, as he is desirous of having all the varieties found on the Pacific Coast included in his collection. He intends to exhibit a model of his cone pyramid at the coming Mechanics Fair, which will, we predict, be one of the most original and attractive objects in the exhibition. We hope his efforts will be generously seconded.—*Bulletin.*

We visited the San Jose Institute lately, and in passing through the parlors noticed some very fine paintings, the work of Mrs. Kinley, wife of the Superintendent. Many of the pictures were original and spoke of talent that would do credit to some of our more pretentious artists. One of these, a sunset scene in Indiana, was especially well executed. Among the copies were two scenes from Cole's Voyage of Life that were very beautiful indeed.

A Chance for Men of Small Means.

It is generally conceded that to make a success of orange-growing a man must have capital. Land that is suitable for their culture and that is well supplied with water cannot be bought for less than one hundred dollars per acre, and often costs more. The trees cost from one to three dollars each, according to size, and to prepare the ground and plant out is an expensive job. When all this is done, the trees must have constant attention and careful cultivation for eight or ten years, before they will return much of an income. It is therefore plain that a man who desires an orange orchard, especially if he is anxious to get it as soon as possible, must be prepared to lay out a good deal of money, at once, and to continue laying it out for a number of years. This being the case, the poor man may well at once dismiss from his mind the illusion that he can come to Southern California, and in a few years possess an orange orchard of fabulous value, unless there is some way in which he can make his living and make his orchard as he goes along. We believe there is a way for the industrious man of small means.

There are men within five miles of this city at the present time, struggling under a load of debt, and trying to hold on to their orange orchards till they come into bearing, who yet do not seem to know that in the cultivation of small fruits and vegetables is their chance for salvation. They borrow money at high rates of interest, and potter around waiting for their trees to produce, and at the same time buy their vegetables, or do without.

It seems to us that a man with a few hundred dollars, and a little industry, can certainly make money in a small way, but a sure one by undertaking the culture of small fruits and vegetables. If he is ambitious of possessing an orange orchard, he can grow one in the meantime. With a few acres of land suitable for vegetables, he can, with hardly any additional expense, raise his own trees, plant them out and care for them, and when they have come to maturity, bringing in a good round income, he will have the satisfaction of knowing that they are the reward of his own industry, with no mortgage on them for capital invested that was not his own.

In this way, men of energy, with a few hundred dollars for a beginning, can make a good living and secure a home surrounded by all the associations that cling to a home made by one's own hands.—*Semi-Tropical Farmer.*

The statistics furnished by Mr. Dodge to the Department of Agriculture reveal, in startling figures, the vast natural wealth of our country. Less than one-fifth of the entire area of the United States is occupied by farms, of which only one-fourth is under tillage. Notwithstanding our enormous wheat crop, the land which produces it is not equal in extent to the surface of South Carolina. Our national crop, maize, covers a territory not larger than Virginia, and the potato crop could grow in less than the area of Delaware. In view of these figures, who can question the boundless resources of America, or look with misgiving upon our steady tide of immigration?

Don't marry a man if he drinks.

Home.

Best of all things to us is home. In hours of ambition and pleasure we may sometimes forget its exquisite sweetness, but let sickness or sadness come, and we return to it at once. Let the hollow hearts that feign a friendship which they do not feel, stand revealed before us—let us know, as we all must at moments, that however important we may be in our own estimation, our places would be filled at an hour's notice should we die to-morrow; then we whisper the magic word Home, and are comforted.

"Home, Sweet Home!" It does not matter how humble it is, nor is it less a home for being a palace. It is where those we love dwell—wherever that may be—where we are valued for ourselves and are held in esteem because of what we are in ourselves and not because of power, or wealth, or what we can do for other people.

Who would be without a home? Who would take the world's applause, and honor, in place of the tenderness of a few true hearts and the cosy fireside meetings where the truth may be spoken without disguise, and envious carping are unknown? In life's battle even the hero finds many enemies and much abuse and slander and detraction; but into a home, if it is what it ought to be, these things never find their way. There, to his wife, the plainest man becomes a wonderful thing—a sage, a man who ought to be President of the United States, and would be were his worth known.

Aeerican Farmers.—We hazard the assertion that no class of equal average means live so well as American farmers. One of them possessing a farm and buildings worth ten thousand dollars will gather about him and enjoy more real comfort than could be obtained from the income of one hundred thousand dollars in New York. He may live in a more commodious building than a metropolitan citizen having ten thousand dollars income. He may have his carriage and horses. His table may be supplied with everything fresh in its season. His labor is less wearing than the toil of counting-rooms and offices, and he has more leisure.

Rev. Daniel Waldo once said: I am now an old man. I have seen near a century. Do you want to know how to grow old slowly and happily? Let me tell you. Always eat slowly—masticate well. Go to your occupation smiling. Keep a good nature and soft temper everywhere. Cultivate a good memory, and to do this you must be communicative; repeat what you have read; talk about it. Dr. Johnson's great memory was owing to his communicativeness.

It is said that grasshoppers will not eat peas. A farmer in Minnesota who observed last year that peas were not harmed, planted 200 bushels of peas this year and they have not been touched. Peas make an excellent substitute for corn to feed to stock, and the fact that they can be raised in the grasshopper region is an important one.

We are a believer in pedigrees for all of the animal kingdom that has been subjected to the uses of mankind, but believe that it is by a selection of the *best* animals of a kind or family, that the race is improved, not by using everything that has the blood of a particular family in it to perpetuate the species.

The man who is only honest when honesty is the best policy is not really an honest man. Honesty is not swerving policy but stable principle. An honest man is honest from his inmost soul, nor designs to stoop to aught that is mean, though great results hang on the petty fraud.

Self-respect is the noblest garment with which a man may clothe himself—the most elevating feeling with which the mind can be inspired. One of Pythagoras' wisest maxims, in his golden verses, is that which enjoins the pupil to reverence himself.

The idea of turning a portion of the waters of the Colorado river from their present bed and cause them to run upon the lands of the Colorado Desert so as to reclaim it from its present waste and worthless condition, is a part of the plan of survey upon which Lieut. Wheeler is at present engaged.

It has been estimated that the American nation smokes 5,168,000 cigars a day. This, at five cents a cigar (and what sort of a cigar can you get for five cents?) would amount to over $250,000 a day.

Physician—"Why don't you set a bound to your drinking, and not exceed it?" "So I do, old fellow, so I do; but then, you see, it's so far off that I always get drunk before I reach it."

Value the friendship of him who stands by you in the storm; swarms of insects will surround you in the sunshine.

What is the use of talking of this world's brightness and sunshine to a man that has tight boots?

Jokes are like nuts—the drier they are the better they crack.

A good throw at dice is to throw them away.

A Standard Temperance Prize Essay.

TO THE FRIENDS OF TEMPERANCE.

The Committee appointed by the National Temperance Convention, held at Saratoga, in 1873, on the subject of a Standard Temperance Work, decided to divide the work into three parts, and to offer Two Prizes for each of the three essays, to be open to all writers who choose to compete therefor, in this and other countries:

1. The Scientific; embracing the Chemical, Physiological, and Medical aspects.

2. The Historical, Statistical, Economical, and Political.

3. The Social, Educational, and Religious.

The fund at command, through the efforts of Job H. Jackson, of West Grove, Chester county, Pa., enabled the Committee to offer one year ago Prizes of $500 and $300 for accepted manuscripts for Part I, and the responses of writers, now under examination, lead the Committee to hope for a work of value commensurate with the great cause it is expected to promote. This encouragement and the fund at command, and personal guarantee of Mr. Jackson, now further enables the Committee to announce Two Prizes for Part II—the Historical Statistical, Economical and Political, and Two Prizes for Part III, embracing the Social, Educational and Religious relations of Temperance viz: For the best essay for each of these parts, adjudged satisfactory, the sum of $500 will be paid; for the second best essay, the sum of $300 will be paid; accepted manuscripts to become the property of the National Temperance Society.

The offers for Part II and Part III will remain open to all competitors one year, till July 1, 1876. Manuscripts [with the names and addresses of the writers by whom they are forwarded for competition, enclosed in separate sealed envelopes, not to be opened till after the award has been made] should be forwarded to A. M. POWELL, 58 Reade street, New York.

The essays should be of such a character that, while adapted in style to interest the general reader, they will also meet the demands of scholarly criticism.

Those who intend to compete for the prizes offered for these essays, and who may desire more information as to the scope of the work and suggested subdivisions, will be furnished with further particulars by applying to Mr. Powell, as above.

In order that the completed Standard Work may be placed before the public at the earliest practicable day, the Committee urgently appeal to friends of temperance to promptly supply them with funds to meet the prizes announced and to publish the work. The sum of $500, at least, additional to that on hand, will be required. Contributions may be sent to JOB H. JACKSON, Treasurer, West Grove Chester county, Pa., to J. N. STEARNS, Publishing Agent of the National Temperance Society 58 Reade street, New York, or to any member of the Committee.

58 Reade st., New York, March, 1875

Mr. STUYVESANT,
Of Edgewood, Poughkeepsie, New York, wishing to increase his Short-horn herd of cattle, offers for sale is entire herd of
AYRSHIRE CATTLE,
Containing Twenty-five Cows in milk and in calf to
"ROBBIE BRUCE,"
Undoubtedly the finest Ayrshire bull in the country; four Heifers, due to calf by the same Bull during the Summer; seven Heifer Calves, dropped this Spring; four Bull Calves of this Spring; one yearling Bull, and the Bull ROBBIE BRUCE. This entire herd will be sold for the sum of **$5,000.**
This herd is composed of the two entire herds formerly belonging to Mr. W. Birnie of Springfield Mass., and Mr. H. S. Collins, Collinsville, Conn. Mr. Stuyvesant having some years since bought these two entire herds, and having had a wedding out sale last fall.
The above stock is now recorded in Mr. Bagg's Canadian and American Ayrshire Herd Book. Mr. Stuyvesant, however, will agree to record all this stock either in the new volume to be issued by the Ayrshire Breeders' Association, or in Messrs. Sturtevant's new work called "North American Ayrshire Register," or in both, to suit the buyer.
Mr. Stuyvesant was awarded the HERD PRIZE at the New York State Fair at Rochester, last Fall, with large competition.
THE PEDIGREES
of this stock are all good. Catalogues containing a description of the herd will be sent on application. Also, catalogue of the small but value herd of Short-horns at Edgewood written out on application.
Address, JNO. R. STUYVESANT,
Edgewood, Poughkeepsie, Dutchess Co., N. Y.

HOW TO PAINT,

CONSISTENT AND INCONSISTENT IRRIGATION OF ORCHARDS.

If an orchard has been irrigated until the surface soil is filled with roots, and then the irrigation of it is neglected for a single season, the drying out of the soil, filled with roots dependent upon it for moisture, will be likely to kill the trees outright; and at any rate they will be severely injured. We have noticed several cases of this kind, first and last, and although we have several times spoken of it, yet we every season see some orchard suffering from such neglect, through the apparent ignorance of the proprietor, who as likely as not, wonders what is the matter with his orchard, and thinks that fruit-trees are short-lived in this California soil and climate. He will tell you how he has irrigated his orchard and cared for it, to give it a good start, and now, when the trees should grow and bear fruit without all that extra care, they "up and die."

Now, while we advocate the irrigation of the orchard where one is so situated that it can be done every summer, we must advise not irrigating at all unless it can be done every year in a consistent manner. There are several good orchards that we have noticed, growing on upland soil without irrigation. They will not produce as much, nor as fine, large, juicy fruit, as an orchard that is irrigated, but the trees are always looking fine and healthy. Such trees, not irrigated, run their roots deeply into the soil, and do not depend upon surface moisture. They grow their roots, as do the California oaks, away below the reach of drouth and hot, dry, cracking surface soil.

On the contrary, trees grown upon soil kept moist by irrigation, spread their roots upon the surface, and send very few deeply into the earth. If such trees are not kept supplied with surface-water, the result must be, and always is, serious. The roots and sap dry up, the leaves turn yellow and fall, and the tree dies of thirst and starvation. The soil in an orchard to be grown without irrigation should be kept loose by cultivation, to prevent the loss of moisture from the under soil by evaporation.

The pruning should be just enough to prevent straggling—just enough to make close, symmetrical, spreading heads. No inside thinning-out should be done. An orchard that, for lack of water, can be irrigated only one, two or three times during the dry season should be cultivated on the same plan as for one not irrigated; and when the water is to be let on, it should be run between the rows in a deep furrow, and not be allowed to wet the loose soil upon the surface at all. And further, when the water is turned out of a furrow, the furrow should be covered up with loose soil to prevent the soil from cracking and the water from escaping into the air.

This system, where trees are watered only occasionally, is excellent, as the roots are encouraged to run deeply, and will never come near the surface except at the furrow in which the water is run. This being some distance from the trees will be all the better: the feeder-roots will take it up gradually. One or two good waterings in this way during the season, letting the water soak into the soil thoroughly in one furrow before running it into the next, will help an orchard wonderfully. The same amount run about the trees upon the surface, would injure instead of benefitting the orchard. The only exception to this rule is upon loose sandy soil with a gravel bottom, where the wafer would leach away instead of soaking into the under soil.

Where abundance of water can be had for irrigating purposes, it has been found to be the best plan to conduct it through among the trees, as nearly upon the surface as is convenient. The soil is to be cultivated lightly as soon as the ground is dry enough to work well after irrigating, and when the soil shows that it is getting dry the same thing is to be repeated. An orchard irrigated on this plan will make a very vigorous growth and produce an immense crop of fruit, and fine fruit, too. The roots will be found near the surface spread like a mat. The finest orchard in the State, Mr. G. W. Tarleton's, is irrigated on this plan, and a plow is never stuck into the ground for fear of injuring the roots, but a cultivator, graded to cut two inches, is run amongst the trees often enough to keep the surface clean and light.

Several persons near San Jose who have cultivated strawberries in their orchards for some years, irrigating the same all summer to keep them growing nicely, and who have dug up the berries and stopped irrigation, have seen their trees die and become worthless. We think it important that every farmer should understand the philosophy of irrigation well enough to never make mistakes of this kind.

SOMETHING ABOUT ORCHARDING

We have taken a look through several orchards this month, and observed many things in the way of fruit and culture worthy of note. Mr. J. M. Patterson, who owns the finest prune orchard, although his crop was cut very short by frost, is still as sanguine as ever and making improvements. His orchard is on moist rich soil, and has never been irrigated, but Mr. P. is making preparations for irrigation, has a Kipp's upright boiler and engine of 3½ horse power which will run two 6 inch pumps, raising water about ten feet. The water stands in the bored well only seven feet from the surface. He has laid a six inch square redwood pipe or floom, 18 inches under ground along the upper side of his grounds. At convenient distances are plugs four inches in diameter, so that the pipe can be tapped and the water conducted at will through any portion of the orchard or blackberry patch. The cost of such a pipe laid down is about $2.00 per rod, and when once placed will last for years and no trouble. Mr. P. thinks that even on his superior moist soil it will pay to irrigate when the fruit is growing. Heretofore he has produced the finest plums and prunes ever seen in market. The cost of Kipp's 3½ horse power upright engine and boiler was $4.50 laid down, and about $60 to set the same, including crank attachments to the pumps. The pumps cost $25 each.

Persons wishing to irrigate with steam power, would do well to examine Mr. Patterson's rig which is most complete and economical in every respect. Mr. Patterson has some old fashioned damson trees in his orchard which the frost did not injure. They have been planted 22 years, and are still fine and healthy and loaded with beautiful fruit. He has several times realized $25 per tree from them in a single season, and will get probably more this year. We picked from a pear tree some Sickle pears that were larger than the average of large Winter Nellis pears. We had to ask the name of them, although we are used to seeing the wonderful productions of California. We never saw finer Bartletts, Flemish Beauties or Buerre Clargeaus. Mr. Patterson's system of cultivation is similar to that of Mr. Tarleton's thorough surface cultivation, only a little deeper, as the surface has not been irrigated. Mr. Pattersons orchard trees are set closer together than trees in any other orchard we know of, excepting the one we shall next notice. He has obtained more fruit from the acre and better fruit by so planting. In our sunny and windy country, we have long been satisfied that close planting is best and have frequently said so before.

Mr. Charles Caine, a prominent fruit producer and dealer, has tried the experiment of planting cherry trees in an apple orchard, between the trees in every row—and with the best success. He can show as fine a growth of cherry trees—and that without irrigation—as any person in the State. His apple orchard, when he purchased it a few years since, was in a neglected condition. It is now fine, all grafted to Newtown pippins and valuable, bringing in a good revenue annually.

Next season Mr. Caine expects a fine crop of cherries from the same orchard without diminishing the apple crop. The only fair crop of peaches near San Jose this season was produced by Mr. Caine. When the nights were frosty in April, and killing everybody's else fruit, Mr. C. built fires among his trees, using brush, straw, and strawy manure for the purpose. As the frosts continued several nights in succession, he ran short of fuel, but managed so as to get a very fair crop of splendid peaches, and he sold them for a big price. A lot of large old apricot trees that are on one of his rented pieces became straggly and spreading out of shape. He cut the limbs well back within a few feet of the trunk last Spring. The result is beautiful, round heads of numerous new limbs, promising lots of fine fruit another season. Every season Mr. Caine "colors" his best fruit for market. This is not done with paint and brush, but with sunbeams. The fruit, after picking, is laid for a few days under a half-shade, so as to get the light without sun-burning. The fruit soon colors up in a beautiful manner. Every one has noticed that while some fruits on a tree are high-colored, others on the same tree are not. The action of sunlight is only needed to give all a charming color. This ripening and coloring process completed, the fruit is nicely packed in boxes and brings the fancy prices—more than double what it would if shipped at once without this trouble. Mr. C. studies to make whatever he undertakes *pay*, and so far with success. The day we were at his place his team was hauling manure to spread thickly upon the soil among his trees. This is something that he knows will pay in increased size of fruit and tree-growth. Thorough surface cultivation is the rule with him, as with all best orchardists.

Benj. Casey. S. H. Herring.

California Agriculturist and Live Stock Journal.

" sixteenth Column	1 00 " "

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

The State Short-Horn Convention will meet in regular Semi Annual Convention, on Wednesday the 22d of the present month (September) during the week of the State Fair. There will be no public auction sales of stock under the auspices of the Society, but we learn that several breeders are intending to make sales on their own account. The general impression among breeders of fine stock is that the spring is a better time for making sales than the fall of the year.

Saving Straw for Stock has finally got to be the rule as it should be on grain farms, instead of the wasting and burning it as was so generally done a few years since. The value of a good straw stack for stock, when feed is short, is being appreciated.

Now the question is, the most convenient and economical way of saving. Undoubtedly an elevator attached to a separator for stacking straw is a great improvement. It saves much time and labor, and will soon be considered an indispensible attachment to all California separators.

Some farmers are thinking of building large sheds, or roofs, in convenient parts of grain fields, where stock can be fed handily, for sheltering straw every season; and they will then stack the grain along side so that the straw elevator will deposit the straw under cover directly from the threshing machine.

Those who have tried this method of saving straw, could not be induced to go back to the old way. We commend this idea to such of our readers as may feel interested in the matter.

Many Subscribers have asked us how they shall remit money. While the matter of remitting a small subscription for a paper should be the easiest thing in the world to do and everybody should know just how to do it, it still is a matter of considerable moment to many who wish to pay for their papers; and it is of some concern to publishers who need these small amounts which aggregate so much when counted upon the books, and without which crumbs a poor publisher would starve. Were currency as good as gold, as it should be, a post office order would be preferable to anything else. Now, if you buy a $1.50 post office order with coin, it is payable to us only in greenbacks, and we loose about 15 cents, which we cannot afford to do while we have to pre-pay that much postage on the Agriculturist. But $1.50 in coin will bring about $1.68 in currency and this will buy a post office order payable to us in like amount, which will be satisfactory to us, and is really the most convenient way of sending small amounts through the mail. An order will cost 5 cents, postage 3 cents more.

Sometimes money comes to us through Wells Fargo Express, costing the sender or us 25 to 50 cents for $1.50. This is paying rather dear for the whistle, although we believe a man better do that than not take the Agriculturist and Live Stock Journal, and pay for it too. Another good and convenient way is to send a check on a San Jose or San Francisco bank. The merchant, where you purchase your family supplies, would most likely furnish you with a check for the money which we could easily get the money on. We advise this as another most convenient way of sending money. The check, which can only be paid to us or our order, can be sent as an ordinary letter with but three cents postage. Be sure and send in same letter your full address, name and post office plainly written. Please do not forget, however, that whatever way you do send it, the most important part of the transaction to the publisher is to get his dues, and one year in advance.

We are asked what are our lowest subscription rates to Patrons of Husbandry. We would like to be able to afford the Agriculturist and Live Stock Journal for half-price to everybody, and give a good farm for a premium besides; but the truth is, $1.50 a year is as low as we can publish it, without several thousand more subscribers; and if every one who takes it doesn't have a better farm, by doing something to make it better, either we do not make a paper worth taking or he does not read as carefully as he might, or else does not practice as well as he should. We believe in the co-operative principle, and if publishing a paper for everybody at a low price does not come near practicing the principle on our part, we would like to know how to better it. A little more co-operation on the part of some of our subscribers in the small matter of paying up promptly, would be appreciated and help matters wonderfully. We shall expect all good Patrons to be willing to co-operate with us, for we are trying to make just such a cheap Monthly Journal as every farmer on the Pacific Coast ought, and can afford to have; in fact, cannot afford to do without.

To our Correspondents or about them we have said very little through the columns of our Monthly, but we feel under many obligations to them and know they have done very much to make the Agriculturist and Live Stock Journal interesting to all readers. And this our readers will attest to, and for our readers we say thanks to you all, and may you never cease to favor our columns. We wish that all farmers and farmer's wives and daughters would feel it a duty and privilege to write something of their experience and ideas upon subjects which interest all. It is *your paper and you* who like to read it should write for it.

By the way, "Uncle Ben" has been able to give a Boys and Girls department entirely original this month, thanks to the young folks. We want you all to write. The Domestic department is also original and good too. We have another "Chat" from "Jewell" on hand for next month, also two other of her articles: "how to dress babies" and "two ways of feeding babies"—both invaluable to mothers who have the care and responsibility of the most precious live stock raised on the farm. These will appear, one next month and the other the following.

It is always most convenient to publishers to have articles come in early, but better late than not at all.

A Recent Ramble through John Rock's nursery discovered to us many things interesting. Within two years Mr. Rock has added greenhouse culture to his other branches of that business. Among the many novelties seen, we will notice his collection of choice palm-trees. At great expense he sent to Central America and Mexico for seeds of the finest varieties of palms, and has been successful in starting over five thousand trees which are growing finely. This is a valuable acquisition to Califsrnia. It is just what we want to see. Mr. Rock can probably come as near filling any order for choice plants and trees of all kinds, as any nurseryman in California.

Our Lompoc Correspondence will be found very interesting. Some of our exchanges which cater to the powerful liquor interest, characterize the proceedings of the temperance women at Lompoc as a disgraceful mob, and say they had better try and cover up their drunkards' shame. We say good, bravo, glory to the women of Lompoc! Uncover the demon alcohol wherever you can find him. Beat him down and out—with law or without law. Give it no rest amongst you. Never hesitate about the means, but do quickly what you find to do, and fail not, falter not in well-doing.

A farmer complains that a hook and ladder company has been organized in his neighborhood. He states that the ladder is used after dark for climbing into his hen-house, after which the hooking is done.

Poetry.

Better Than Gold.

BETTER than grandeur, better than gold,
Than rank and title a thousand fold,
Is a healthy body, a mind at ease,
And simple pleasures that always please.
A heart that can feel for a neighbor's woe,
And share his joys with a genial glow.
With sympathies large enough to enfold
All men as brothers, is better than gold.

Better than gold is a conscience clear,
Though toiling for bread in a humble sphere,
Doubly blest with content and health,
Untried by the lust of cares or wealth.
Lowly living and lofty thought
Adorn and ennoble a poor man's cot;
For man and morals and Nature's plan
Are the genuine test of a gentleman.

Better than gold is the sweet repose
Of the sons of toil when their labors close.
Better than gold is the poor man's sleep,
And the balm that drops from his slumbers deep,
Bringing sleeping draughts to the downy bed
Where luxury pillows his aching head;
His simpler opiate, labor deems
A shorter road to the land of dreams.

Better than gold is a thinking mind,
That, in the realm of books can find
A treasure surpassing Australian ore,
And live With the great and good of yore.
The sage's lore and the poet's lay,
The glories of empires pass away;
The world's great drama will thus enfold
And yield a pleasure better than gold.

Better than gold is a peaceful home,
Where all the fireside charities come;
The shrine of love and the heaven of life,
Hallowed by mother, or sister, or wife.
However humble the home may be,
Or tried by sorrow, with heaven's decree,
The blessings that never were bought or sold,
And centre here, are better than gold,

A Voice to Young Men.

BY ANNA LINDEN.

Stand nobly up and face life's work
With brave and honest soul,
And let no false and foolish pride
Your manly heart control.
Stand out in honest, bold relief—
A worker and a man;
Something of use in this great world,
After your Maker's plan.

And if you keep your morals pure,
And cultivate your mind,
And stand up nobly for the right,
Anp live as God designed:
Then, sir, you need not bend the knee
To bank stock nor to gold;
For there is wealth of higher worth
Than figures ever told.

Work is most noble, good and grand,
Since God ordained it so:
It keeps the heart from cankering rust
And muses the nation grow.
The workers are the nation's wealth,
And not the idle drones.
Work makes the country prosperons,
Makes happy hearts and homes.

'Tis good to see the honest face
And stalwart, manly frame,
With muscles that bespeak of strength,
And hands to match the same—
Hands that look competent to grasp
And grapple with life's foes,
And cause the barren wilderness
To blossom as the rose.

Ashamed of labor! No, not you,
Since that was God's decree;
For honest and industrious toil
Brings glad prosperity.
It frames and builds up all the good
A nation's life can know—
Science, and art, and fame, and wealth,
From work and effort grow.

Spurn indolence, whose weakening grasp
Blights manliness and worth;
Be something to yourself and friends:
Be useful to the earth.
Make labor noble in itself
By being nobly done,
And make fair Nature's heart rejoice
To own you as her son.

It matters not if hands and brains
Are all your stock of wealth.
With steady, patient industry,
And energy and health,
You yet may rise to lofty heights,
As others have before,
And crown the throne of wealth and fame
With one brave victor more.

Go Ahead.

When your plans of life are clear,
Go ahead;
But no faster than your brains.
Haste is always in the rear.
If Dame Prudence hold the reins,
Go ahead.

Do not ask too broad a test—
Go ahead.
Lagging never clears the right;
When you do your duty best,
You will best know what is right—
Go ahead.

Never doubt a righteous cause,
Go Ahead.
Throw yourself completely in,
Conscience shaping all your laws;
Manfully, through thick and thin,
Go ahead.

Do not ask who will go with you,
Go ahead.
Numbers! spurn the coward's plea!
If there be but one or two—
Single-handed though it be,
Go ahead.

Though before you mountains rise,
Go ahead.
Scale them? certainly you can.
Let them proudly pierce the skies;
What are mountains to a man?
Go ahead.

Though fierce waters round you dash,
Go ahead.
Let no hardship baffle you.
Though the heavens roar and flash,
Sit ll undaunted, firm and true,
Go ahead.

Heed not Mammon's golden bell,
Go ahead.
Make no compromise with sin.
Tell the serpent he looks well,
But you cannot let him in.
Go ahead.

Better days are drawing nigh.
Go ahead,
Meking duty all your pride,
You must prosper, live or die;
For all heaven's on your side,
Go ahead.

Love and Labor.

We die ant all, for our deeds remain,
To crown with honor or mar with stain.
Through endless sequence of years to come
Our lives shall speak though our lips are dumb,

What though we perish unknown to fame,
Our tomb forgotten and lost our name,
Since naught is wasted in heaven or earth,
And nothing dies to which God gives birth.

Though life be joyless and death be cold,
And pleasure pall as the world grows old,
Yet God has granted our hearts relief,
For love and labor can conquer grief.

Love sheds a light on the gloomy way,
And labor hurries the weary day.
Though death be fearful and life be hard,
Yet love and labor shall win reward.

If love can dry up a single tear,
If lifelong labor avail to clear
A single weed from before the true,
Then love and labor have won their due.

What though we mourn, we can comfort pain;
What if we die, so the truth be plain.
A little spark from a high desire
Shall kindle others, and grow a fire.

We are not worthy to work the whole.
We have no strength which may save a soul.
Enough for us if our life begin
Succes.ful struggle with grief and sin.

Labor is mortal and fades away,
But love shall triumph in perfect day;
Labor may wither beneath the sod,
But love lives forever, for love is God.
—[Chambers' Journal

The Bachelor's Advice.

If determined to marry, why so let it be,
But first tarry a moment and listen to me.

To save you some trouble and maybe some strife,
Look well to the woman you choose for a wife.

If ugly the maiden, why let her go in,
And frighten some other less timid than you.

If fair, then beware lest your house should become
The haunt of gallants when you're absent from home.

If poor, let her pass, and all wooing give o'er;
For discord comes in when the wolf's at the door.

If wealthy, avoid her; she'll certainly wear
Those garments that pride should forbid you to spare.

If old, bid the beldame in quiet to go.
A man should not marry his mother, you know.

If young, have a fear of the tempest and storm.
Young hearts are rebellious, young blood is too warm.

If short, ponder long ere you make her your bride;
Who stoops to a mate must abandon his pride.

If tall, drive her off, if 'tis needed with whips.
'Twould fatigue to much to climb to her lips.

If sly, bid her troop to her mother at once,
Lest when you have wedded the world call you dunce.

If frank, to her outspoken speech give no ear;
She may tell you some truths not so pleasant to hear.

But should there be one who is neither of these,
Then win her and wed her as soon as you please.

But first, at the bridal a goblet fill up
With poison, then drain at one swallow the cup.

For thus, and thus only, a man may forego
The evils from marriage that certainly flow.

A Woman's Answer to a Man's Question.

Do you know you have asked for the costliest thing
Ever make by the Hand above—
For a woman's heart and a woman's life
And a woman's wonderful love?

Do you know you have asked for this priceless thing,
As a child might ask for a toy,
Demanding what others have died to win
With the reckless dash of a boy?

You have written my lesson of duty out,
Manlike you have questioned me;
Now stand at the bar of my woman's soul
Until I shall question thee.

You require your mutton shall always be hot,
Your socks and your shirts be whole;
I require your heart to be true as God's stars,
And pure as His heaven your soul.

You require a cook for your mutton and beef;
I require a far better thing.
A seamstress you're wanting for socks and for shirts;
I look for a man and a king.

A king for the beautiful realm called home,
And a man that the Maker, God,
Shall look upon as He did the first,
And say, "It is very good."

I am young and fair, but the rose will fade
From my soft young cheek one day;
Will you love me then, 'mid the falling leaves,
As you did 'mid the bloom of May?

Is your heart an ocean, so strong and deep
I may launch my all on its tide?
A loving woman finds heaven or hell
On the day she is made a bride.

I require all things that are grand and true—
All things that a man should be.
If you give this all, I would stake my life
To be what you demand of me.

If you cannot be this, a laundress and cook
You can hire with little to pay;
But a woman's heart and a woman's life
Are not to be won that way.

The Sower.

BY ROBERT MORRIS, LL. D.

He that hath ears to hear
May listen now.
While I shall tell, in simple words indeed,
Of a good husbandman who took his seed
And went to sow.

Some by the wayside fell
On breezes borne
The fowls of heaven flew down—a greedy train—
And snatched with hasty appetite the grain,
Till all was gone.

Some fell upon a rock,
And greenly soon
They sprouted as for harvest, strong and fair;
But when the summer's sun shone hotly there
They wilted down.

Some fell among the thorns,
A fertile soil;
But ere the grain could raise its timid head,
Luxuriantly the accursed weeds o'erspread
And choked them all.

But some in the good ground—
God's precious mould—
Where sun, breeze, dew and flowers apportioned well,
And in the harvest smiling swains could tell
Their hundred-fold.

A FARMER'S economical daughter in Massachusetts put off her wedding-day because eggs were forty cents a dozen, and it would take two dozen for the wedding-cakes and pudding.

SCIENCE OF CULTIVATION.

There is one question that is of considerable importance in its bearing upon the matter of the best cultivation for our climate, which we would like the opinion of the best philosophers and scientists upon in a practical manner. We feel decided upon it already in our own mind, but see that others differ widely from us. We believe that all questions of science and natural philosophy are as capable of absolute demonstration as are questions in mathematics. But a wrong comprehension and interpretation of facts, and a little false reasoning, will terribly warp one's understanding, even upon questions apparently easily capable of proof conclusive.

As differing in the main from us, we copy below something from the *Record-Union* upon "California's climatic phenomena, considered in reference to agriculture:"

AGRICULTURAL EFFECTS.

"We have stated that the reason why California suffers less from drought, during her long, dry seasons, than most other countries do if they fail to have rain every few weeks, is traceable to the same cause that produces her cold nights—namely, her dry atmosphere. This proposition at first thought, we know seems impossible; but it is nevertheless true, and is accounted for upon simple philosophical principles. We will endeavor to explain it. The temperature of the soil partakes of the temperature of the surrounding atmosphere, and all the heat of the soil comes from the sun through the atmosphere. We have shown that a wet atmosphere retains the heat during the night, while a dry atmosphere becomes cool quickly in the absence of the sun. Is it not plain, then, that the loose worked soil, lying under a damp atmosphere, will become heated to a greater depth during a long warm season than it will when equally loose under a dry atmosphere? and that it will indeed assume much nearer the temperature of the atmosphere itself? Experience proves this to be true. The loose soil in New York, for instance, at a depth of six inches in the month of August indicates the same, or nearly the same temperature as the atmosphere above it, while equally loose soil in California shows three or four degrees lower temperature than the atmosphere above it. Now to this fact apply the well-known atmospheric phenomena of condensation of moisture on a cool surface. Ice-water in an earthen pitcher, on a warm day, even in our dry climate, very quickly causes water to accumulate on the outside of the pitcher from the surrounding atmosphere. So a cool soil, in our hottest days, is constantly condensing and absorbing the moisture from our dry atmosphere, and with this moisture feeding the roots of plants. Hence, if the soil be loose deep down—and the deeper the better, because the greater the difference in temperature between its lower particles and the atmosphere, every particle of that soil presents to the atmosphere a condensing surface, and, like the pitcher, draws from it its moisture. But in the Atlantic States, or any other country where the temperature of the soil becomes equal to that of the atmosphere, there can be no condensation of the soil, and consequently the soil can obtain no moisture from the atmosphere, except the condensation takes place in the atmosphere itself, and falls upon the soil in the form of rain. Hence, the absence of rain for a few weeks brings destructive drought, though the atmosphere may be so moist as to be absolutely oppressive and scalding to the touch. A great many farmers hold to the theory that the moisture in a loose soil comes from below by evaporation. Hence they stir the surface frequently, as they say, to let the moisture come up. This theory incorrect. If it were true that the moisture comes from below, then the harder and more compact the surface the more moisture would be kept in the ground, for the very plain reason that it could not escape through a compact and tight surface as readily as through an open one. The truth is that a compact surface on the soil permits evaporation, but does not present the cool surface to induce condensation as does a loose soil. The atmosphere penetrates a loose soil as deep down as it is loose, and the cool surface it there meets robs it of its moisture, while it cannot penetrate a loose soil to be robbed. A few familiar facts, perhaps, will illustrate the point better than pages of reasoning. Many of our farmers have dug wells in this country in the dry summer months, and have thrown out piles of dry soil, and have been surprised to find, in the course of a day or two, that the dry soil so thrown out had become quite moist; even more moist than the natural surface upon which it was thrown. How came this about? Was it by evaporation from the natural surface below up through the new soil thrown out? This could not be; for if you dig down ten inches in the newly excavated soil it is as dry as when first thrown out, while perhaps four inches down it is damp enough to germinate seed, and frequently does it when seed will not germinate on the natural surface. The fact is, the soil thrown out of the well is cold, and condenses the moisture from the atmosphere."

How it is possible for any one to steer so wide from the mark, or to make such false deductions as are indicated in the above extract is wonderful at least. The idea advanced of condensation of moisture from our dry atmosphere by a loose soil is almost too preposterous to allow of a moment's consideration. This condensation theory, as applied to the soil, is, on general principles, one of the biggest humbugs ever preached; and he who expects to raise a crop from land that depends, for water, upon condensation of moisture from the air will carry his crops away in the corner of his eye, and particularly in a dry climate like ours. Why, the dew point, as indicated by the wet bulb of the thermometer, ranges, in dry weather, from twelve to forty degrees below the temperature of the atmosphere in the shade; and the surface soil, exposed to the rays of the sun, gets heated up, and remains so all through our dry season, several degrees higher than the dew point. Hence, the impossibility of such condensation. The dryer the air the greater the difference between the dew or condensing point and the temperature of the air; and before condensation of moisture can result, the temperature of the soil must be really below the dew point several degrees. The idea of our dry soils, lying under the summer suns of our cloudless climate, condensing moisture from the drying air, reminds us of the saying, "drawing blood from a turnip." The evaporation of all free moisture from the soil into the atmosphere is the natural and inevitable result of contact of the air with the soil, superstitious theories to the contrary or not. And whether the soil is solid or loose, the process of absorbing moisture from the soil goes on just as fast as the conditions will admit. The true policy of cultivation for retaining moisture is to leave the surface soil in the best condition to resist the drying action of sun and atmosphere. This is found, by experience, to be a mulching of loose material, such as straw, leaves, manure, dry earth, etc. If the soil is compact to the very surface, the moisture as it rises from below, by the laws of capillary attraction and equal distribution, is at once licked up by the drying air that comes in contact with the compact surface. Every farmer has noticed how soon such soil will dry off and crack in a dry, windy day. A mulching over such soil would act as a non-conductor of air and moisture and of heat and cold, as our clothes, when made of soft material, do to protect our bodies. A rapid evaporation of moisture from any surface lowers the temperature of that surface. A condensation of moisture, on the contrary, raises the temperature of the surface.

In the Atlantic States in early Summer, when the days are very hot and the air is surcharged with moisture—the dew point being very high—and the soil is cold from the melted snows and frost of winter, there is more or less condensation of moisture from the air by the soil, which at once tends to cool off the air and warm up the soil. But after the soil once becomes heated in July and August, such condensation ceases, even in that moist climate. A mulching to retain the moisture in the soil is as necessary there in midsummer as in California. Moisture does not come from below by "evaporation," as the *Record-Union* expresses it, but by capillary attraction; and instead of the farmer "stirring the soil to let the moisture come up," it comes up itself without stirring, and the farmer stirs the surface to keep the moisture from exposure to the air and sun, and to keep it from escaping readily into the air by evaporation. A stirring of the surface soil makes it loose and dry, but this loose, dry earth acts as a blanket to cover the moist soil beneath and keep it from drying out.

Our best orchardists and gardeners find that a light surface cultivation of not over two inches deep, is the best sort of tillage that they can give to retain moisture and secure the best growth. What our cotemporary says about earth from wells condensing moisture from the air must be a fabrication of the imagination and simply merits a denial.

Sheep and Goats.

MORE FACTS AND FIGURES ABOUT THE ANGORA GOAT.

LUSTER and length of staple are the two qualities which are required in mohair. Mr. Farr, manager of the Holyoke, Mass., Alpaca company, asserts this—It is the luster which gives this hair its chief value. Goods made from it must look bright and glossy to be valuable. And it must have length to be worked advantageously. The same gentleman asserts that hair ten inches long is worth, per pound, more than twice as much as hair five inches. He also asserts that the principal drawback to the California staple is the shortness. The luster is equal to that of the best Turkish mohair. He concludes:

If California farmers can grow the stock to average eight or ten inches long, the success of it as a valuable commodity is certain. We

recently bought a few bales of California mohair and paid 85 cents per pound. It was about seven inches long, and had to be mixed with ordinary combing wool to carry it through, which of course detracts a good deal from the brightness of the goods. Had it been two inches longer, it would have been well worth $1 per pound.

Messrs. Hall & Turner, of the Jamestown, New York, Alpaca Mills, say that they are receiving some very good specimens of goats' hair from breeders on this Coast, and every year expect to see more of high-grade quality.

Mr. C. P. Bailey, of San Jose, who gave us returns of last year's clip from S. Thompson, Nephew and Co., New York, which appeared in July number, has shown us a letter from Messrs. Hall & Turner, containing returns of this years clip, 920 pounds nett, which is as follows :

342 lbs long mohair at 75c.	$256.50
588 " short " " 23c.....	135.24
Total.....	391.74
Freigt on bundle of 1030 lbs.....	27.50
Net.....	364.24

They complain of shortness of staple in California fleeces. This is owing mainly to the fact that many of the goats shorn are not of high breed. When it is remembered that nearly all the flocks of Angora on this Coast were bred up from common ewe goats with Angora bucks, all within a few years, it will be seen that the remedy is in breeding up as fine as posible, with constant selection of pure bucks with the longest staple. In order to produce a long, clear staple of mohair, the goats should be well supplied with pasturage the whole season through. Full feed a part of the time and a few months of short, poor feed will not make a prime staple of mohair, any more than it will of wool. This is a matter of considerable importance. While a goat will keep fat on feed that will barely keep a sheep alive, yet they should be kept in good order the whole year through to grow long, lustrous, strong mohair of first quality. Mr. Bailey has also shown us samples of goods manufactured from mohair, consisting of mohairs, alpacas, poplins, etc., ranging in price from 32 to 82 cents per yard, wholesale. Any one who would examine these would affirm that there must always be a demand for such goods, and it is the demand that will govern the prices to a great degree. The supply cannot for many years lower the prices.

Mr. A. W. Butler, writing upon the "Resources of Monterey County," says of the of the Angora goat :

The process of breeding a good, wool-bearing flock of goats by breeding pure Angora bucks to the common ewes of the country, is indeed a slow one, but those who have persevered are now reaping their reward. California has a large amount of rough mountain land just suitable for goat-raising, and not very valuable for any other purpose. Such pastures cost the breeder very little, and the goats prefer them and keep fatter on these mountain pastures than they do on the more level arable valley lands. In this county the Santa Lucia and Gabilan mountains contain many thousand acres of Government land, suited to the grazing of goats. Here the Angora finds a home very similar to his native home in Angora Bay, Bazare and Constimuni. The progeny of the imported goats raised in this county are generally larger and heavier fleeced than the original imported animals. The work of taking care of the animals is light, as they pick their own living the entire year, and never need feeding. The goat raiser must, however, be at his post during the season for dropping kids, and see that every one is saved, as this is his harvest, but after this is over he can lie back at his ease, and rejoice at his good fortune in having chosen so desirable an undertaking. In a few years the owner of the flock will become independent, his out-door life will give him the best of health, and should ambition prompt him he will be enabled to enter other fields of useful employment. It is doubtful, however if he ever goes into any enterprise that will give him so much satisfaction as the raising of the Angora goats.

As we have spoken of the business so enthusiastically, perhaps a little history of it in this county might not be out of place. Mr. C. P. Baily came to this county eight years ago with a flock of two hundred half-breed ewes and one pair of pure-bred goats (a buck and a doe) and located in the foot-hills of the Salinas Valley, He has now one of the largest, if not the largest, flock of high-grade goats in America, and last year sold $5,000 from his flock. Thomas Butterfield & Son, and Mr. Landrum, of the firm of Landrum & Rogers, came to this county about the same time that Mr. Bailey came, and have both engaged quite largely in importing pure breeds and in raising pure breeds and grades. Thomas Butterfield & Son sold from their flock during the past year over $20,000 worth of stock. Messrs. Landrum & Rogers' sales have been very large, and they now have a very fine flock. There are, perhaps, a dozen smaller flocks in the county that are doing well. Thus far breeders have realized their main profits from the sale of stock, but hereafter they may look for an income from the wool product.

Many have been deterred from going into the business on account of the uncertainty of sale for wool on this continent. For the past one hundred years there has been a steady demand and plenty of purchasers in the London and Liverpool markets, and goats' wool or mohair has brought about three times as much as sheep's wool. The production of goats' wool in this country has created a demand for it here, and now the Jamestown Mill, N. Y., the Riverside Mill, N. Y., and a mill in Philadelphia are ready to buy and work all the good wool that can be produced ; and they will pay from fifty cents to one dollar per pound for it. An establishment has been started recently at San Jose, to tan, dye and manufacture goat skins into robes, coats, etc., and manufactured skins found ready sale at from two and one-half to ten dollars each. With the present outlook, is not here a large field open, inviting the attention of labor from less favored countries?"

The fact of Mr. Bailey selling so many of his high-bred goats accounts for his not shearing more high-grade mohair. The short staple not used by the alpaca mills is sent to the carpet factory and used in making the finest carpets, to give gloss to the white portions. The new tannery and coloring establishment in San Jose, above mentioned, is to be greatly enlarged by a stock company lately formed for the purpose. Messrs. Welch & McCracken will still be the head of the manufactory; but a stock company representing $50,000 has been formed, composed of some of the leading business men of San Jose, incorporated as "The Angora Robe and Glove Company." The design is to enter largely into the business of dressing, tanning and coloring the Angora goat and other skins into robes, mats, furs, gloves, etc. We have spoken of this branch of business before, as one likely to become a most important industry. There is no doubt in our mind that the Angora goat will prove to be one of the most valuable acquisitions to our State. He will draw nourishment from high, rocky hill-tops and waste places, and give a fleece, that for beautiful white may be compared to the water-lily, that draws its life from the mud at the bottom of marshy ponds. But while the lily is simply beautiful, the goat is as full of utility as beauty ; the shining fleece to be woven into fabrics, or used as furs, trimmings, robes, etc., in many ways, and the tanned skins converted into nice gloves, while the meat, which is sweet and wholesome, will furnish food for toiling thousands of people.

Correspondence.

Lompoc Temperance Colony, Santa Barbara County.

Eds. Agriculturist:—I am under promise to write you from this place. I have long intended to redeem my promise, for the benefit of the many readers of your varied, practical and wide-awake paper, but hitherto I have been very busy.

Well, about this much-praised valley. At a distance, I do not doubt, some think it over praised, so much has been said in its favor; but I can simply say, with all my neighbors, that the longer I am here and the more I see of it, the better I like it and the stronger grows my faith in its fertility, its capability of withstanding drought and its future. Had not the soil been so rich and naturally moist, we should have raised nothing, for the Spring had well advanced before most farmers could get to ploughing, not to say planting. This year, too, you remember, the rains ceased very early. Notwithstanding all this you would be astonished to see how vigorous is the growth of corn, beans, potatoes, pumpkins, beets, etc. Experiments with sweet potatoes, flax and tobacco are also very encouraging. Barley is all harvested, most of it being cut for hay. This, with some hundreds of tons of wild oats and clover hay cut from our splendid grazing valley, will fully supply the whole settlement till our abundant grass comes again, which, on this warm, loamy soil, is directly after the first rains. I think we will have enough potatoes, of the very finest quality, both as to size, flavor and freedom from all disease, for home consumption and seed for next year ; but there is not likely to be any surplus, as almost every available acre will be planted next season, so encouraging is the result on the comparatively small scale of this year.

This is a number one valley for all root crops. Grain will grow well enough; but it is rather a question whether the growth of wheat would not be so rank in this moist land and climate as to lodge and rust; yet one man has raised a ten-acre patch of fine, plump wheat. The foot-hills and mesa land will probably be tried pretty largely, as we are to have a grist mill on our mountain stream—the men to build and work it are right here now. On ranches above us they will sow wheat largely. We have abundance of timber and brush. Farmers are already at work clearing a large

area of land for next season. We have also fine land for dairy and hog ranches. Of the former we have two in active operation, and a gentleman from Watsonville has lately purchased land to the value of $6,000 cash for the latter purpose. As we shall be able to ship to San Francisco direct from our own wharf, a large number of hogs will be raised by different parties.

Game is abundant—quail, deer, rabbits and some wild duck. So is wild honey of the purest and sweetest quality. A good deal of building is going on, some residences being large, substantial and tasteful. A neighbor of mine has nearly completed a brick house of good size. We have excellent lime, two kilns supplying the demand. We have also two brick-yards. We have two good schools, attended by nearly one hundred children. We have also Sunday school and preaching regularly by our resident minister, J. W. Webb, late pastor of the Christian Church at Ukiah, formerly of Gilroy, and by Rev. T. D. Lewis, of the M. E. Church, Santa Maria. You will be glad to learn that the temperance sentiment is sound and strong. Besides an active Lodge of Good Templars, we have an open-air temperance meeting in a lovely grove near town on Sunday afternoons, with musical and literary exercises and speeches. We are about to build a good schoolhouse in town. And by the way, the town is a wonderfully healthy infant for only seven months old. It contains three general and one hardware store, a butcher's, a bakery, two harness shops and one printing and newspaper office, the *Lompoc Herald*, a live temperance paper, editor, W. W. Broughton, one of the stirring men of the times, to whom, as much as to any man, this colony owes its existence and prosperity. We have a first-class hotel, well-conducted and thoroughly temperance, two livery stables, a drug store, post office, boot makers, large boarding-house, dress-makers, laundry, Justice of the Peace, Notary Public, a good lawyer—A. E. Hancock, late County Judge of Santa Cruz county—etc., etc. I enclose an article with resolutions passed at our first open temperance meeting. The Grange also passed a strong and plain resolution favoring temperance and the keeping out of saloons. Families are coming in all the time, and many others are writing with a view to coming. Now is the time for intending purchasers, settlers or renters to come to be in good time for cropping, which, in this southern part of the State, is very early. You can plow most of this valley almost any time of the year, and rain is no hindrance except when actually falling heavily. The Company desire only good, sober, energetic men. No one should come without some outfit or means to get it, and at least some capital—a little ready cash is so handy everywhere—although the Company gives ten years in which to pay up. Hoping this will not be too long, I remain truly yours. J. P. Ross.

P. S. I should add that while other places are complaining so of the heat, we are having the most pleasant summer possible, a cool breeze fanning us a part of every day and most refreshing nights.

Again I re-open my letter to say that last night the ladies—a noble band—and gentlemen of Lompoc valley for five miles round, some hundred strong, visited the drug store, convinced that the stock of alcohol was too great for the medicinal need of a healthy temperance colony, and that it was being too freely dispensed for the morals of the community. The liquor was about all poured out before the party left. Every store was then visited but no liquor found. Each proprietor freely promised not to keep even "bitters."

Liquor in the Temperance Colony.

From a private letter from the above correspondent we take the liberty of publishing below what he says about a raid of the women on a graduated liquor shop called a drug store. By the way, similar troubles have occurred in Greeley, Colorado, in that temperance colony. It seems that the sale and use of alcohol as medicine is the loophole where the "devil" can generally crawl in unmolested. When all temperance people learn to discard alcohol as a medicine, and cease to employ physicians who dare recommend or prescribe the abomination, a healthier condition of affairs will exist:

Lompoc has experienced a commotion. You may have read notices of out-door temperance meetings in the *Record*. An old wheel-horse in the temperance cause might readily imagine that there was some secret cause for these meetings.

It had been whispered about that our druggist(a physician) was taking advantage of our by-law prohibiting the sale of intoxicating beverages, excepting upon the written prescription of some physician. He could and had, it was said, prescribed "whiskey straight." So much for that. Many persons attended these meetings and voted to discountenance the sale of liquor and uphold temperance principles generally. Saturday last "forbearance ceased to be a virtue," the following facts, as near as I could learn, being the cause. Mr. and Mrs. Swanton, of the "Swanton House," Pescadero, have an only son who has contracted the habit and appetite for strong drink to such a degree that he had no longer any control over himself. His parents, thinking to place him beyond temptation, sent him and his young wife to Lompoc and set him up in business; but he found means, even here, of indulging his insane appetite. This brought trouble to his wife, who had previously left him on account of his habit, and only consented to return when she saw a chance to live with him in Lompoc free from temptation—a miscarriage, spasms and alarming symptoms generally; but through kind and skillful treatment she had so far recovered as to be free from spasms. During this lull she told her physician that her great suffering was caused by her husband's conduct; that her pains were nothing in comparison with that. She had prayed the Great Father to remove her. The doctor went out to talk to the husband, found him intoxicated, after the talk they both returned to the sick-room, and as soon as Mrs. Swanton saw the condition of her husband she screamed, went into a spasm and died.

The body of this innocent victim of the curse of intemperance was buried Sunday, and on Monday the noble women of Lompoc rose up in might, backed by the men, and waited upon our *druggist*. They first called upon the President and officers of the Company, who headed the crowd and requested the druggist to stop the sale of alcoholic drinks. The druggist refused. The President, Judge Hancock, being a peace-officer, retired, and the women took the matter in hand and proceeded to turn out all the liquor they could find. They rolled out a barrel of whiskey and knocked the head in. Demijohns were turned upside down, bottles passed out to the crowd and broken, and soon the floor was swimming with the vile stuff. From the drug-store they went to all the grocery stores and requested the proprietors to desist from selling all liquors, including all patent bitters in vogue. Every storekeeper promised, and the ladies then paid their respects to an Italian, a former resident of San Jose, Mr. Molenaiy, who keeps quite a quantity of California wine. His place is one mile from town. He also made satisfactory promises, and the crowd dispersed.

Yours, J. P. Ross.

I think more of Lompoc than ever.

A Tip-top Letter from the Santa Cruz Mouetains.

Eds. California Agriculturitt and Live Stock Journal: We are now reaping the pecuniary benefits of one of the most favored fruit-growing localities of favored California. We have not only an abundant crop, but a ready market at highly remunerative prices, with little to pay for freight or commissions to middle men. I said one of the most favored—perhaps I might truly say the most favored. For twenty years we have seen no failure in good crops of apples, peaches, plums, grapes and gooseberries, and but one failure of cherries. This year, when failure is so common, we can add to our list apricots, almonds and currants. The late rain is doing wonders for our last Spring's planting of plums and prunes. I have never seen a finer growth. From long experience, we are making the growing of table grapes, plums, prunes, peaches and late-keeping apples a specialty. To these I have added the breeding of the Angora goat to utilize my brush and timber land. They are thriving finely, with but little care except in kidding time.

Our climate as a place of residence is well attested by the number of persons from your valley and other parts who seek to get a sniff at it during the Summer.

I fear your report of the doings of the Agricultural Society will arouse as much of a hornet's nest as did your attack on the whis key ring. L. J. Burrell,

Mountain Home, August 15th, 1875.

A Permanent Whitewash.—Take half a bushel of unslaked lime. Slake it with boiling water, covering it during the process to keep in the steam. Strain the liquid through a fine seive and add to it a peck of salt previously well dissolved in warm water, three pounds of ground rice boiled to a thin paste, and stir in when boiling hot half a pound of powdered Spanish whiting and a pound of clean glue which had been previously dissolved; add five gallons of hot water to the mixture, stir it well and let it stand a few days covered from the dirt. It should be put on hot.

Whitewash for Indoors.—The following recipe for indoor whitewash has been thoroughly tried and said to answer the purpose better than anything else yet tried. The quantities are for a house of eight rooms, and we get it from an old number of the *American Agriculturist:*

"About 33 lbs. Paris white and one lb. best white glue are needed. Dissolve the glue in hot water. Also make a thick wash with Paris white and hot water, and add the dissolved glue and sufficient water to make the wash of the proper consistency. As the mass stiffens over night, warm or add hot water to make it limpid. The Paris white is chalk cleansed from its impurities, and is only a very pure whiting—better than is ordinarily used for making putty. We use the Cooper glue, which is considered the best here, but any good white glue will answer. It costs here 50 cents per pound at retail, and the Paris white three cents per pound. Both articles can be obtained in almost every city or village."

The above makes an excellent whitewash, clean and white and not easily rubbed off. Its first cost is more than lime wash, but it is durable and for nice rooms it is far preferable.

Domestic.

The Perplexed Housekeeper.

WISH I had a dozen pairs
Of hands this very minute;
I'd soon put all these things to rights—
The very deuce is in it.

Here's a big washing to be done,
One pair of hands to do it.
Sheets, shirts and stockings, coats and pants,
How will I e'er get through it?

Dinner to get for six or more,
No loaf left o'er from Sunday,
And baby cross as he can live,
He's always so on Monday.

And there's the cream—'tis getting sour
And must forthwith be churning;
And here's Bob wants a button on—
Which way shall I be turning!

'Tis time the meat was in the pot,
The bread was worked for baking,
The clothes were taken from the boil—
Oh, dear! the baby's waking.

Hush, baby dear! there, hush-sh-sh!
I wish he'd sleep a little,
Till I could run and get some wood
To hurry up that kettle.

Oh, dear! if P——— comes home
And finds things in this pother,
He'll just begin and tell me all
About his sainted mother.

How nice her kitchen used to be,
Her dinner always ready
Exactly when the noon-bell rang—
Hush, hush, dear little Freddy!

And then will come some hasty word,
Right out before I'm thinking;
They say that hasty words from wives
Set sober men to drinking.

Now, isn't that a great idea,
That men should take to sinning
Because a weary, half-sick wife
Can't always smile so winning?

When I was young I used to earn
My living without trouble,
Had cloths a-nd pocket-money, too,
And leisure hours double.

I never dreamed of such a fate,
When I, A LASS! was courted—
Wife, mother, nurse, seamstress, cook housekeeper,
chambermaid, laundress, dairy-woman and
scrub generally, doing the work of six,
For the sake of being supported!

Chats With Farmers' Wives and Daughters---No. 9.

BY "JEWELL."

"*Dear 'Jewell!*' A reader and admirer of your 'Chats' asks the privilege of saying to you that her eyes filled with tears of gratitude on reading your article in the August number of the Agriculturist, telling husbands that their faithful, toiling wives de*serve* praise as much as their fine grain-cutters; and oh! how much more they *need* the cheering words. Being an old maid does not make me ignorant of the fact, that many a weary woman, with finest instincts alive to wifely duty, and heart filled with warm mother love and anxious care, drags her heavy footsteps from year to year without one-fourth the pecuniary reward that would be given to Bridget, and with not one-tenth the loving words and affectionate caresses that would be voluntarily bestowed on the trotter that had won for his owner a purse of gold on the race-course.

Just at my elbow sits a wife and mother who says she hopes your appeal will catch the attention of her husband, who never seems to think his wife is dishonestly treated, if after a hard day's work she has not one penny reward or even one kindly word given her; and if the hungry, waiting heart forces the lips to say, 'have I not done well to-day? and if so, why do you not, at least, stroke my head in praising, as you would not forget or neglect to do to your pointer if he had brought you a bit of game?' he replies loftily, 'oh, your reward ought to be the consciousness that you have done your duty!' and no doubt he congratulates himself that he has done his duty when he has given her this piece of wonderful information. And this woman is loving and lovable, and could fill her home with blessing and sunshine; but years of ceaseless household cares, with never a day for rest or recreation, never a loving word or approving smile to strengthen her tired spirits, have well-nigh robbed her of all ambition to be anything more than an unpaid servant. I know half a score of good women right in the block where I live, all wearing this same tired, disappointed look, who would be bright happy wives only for this selfishness on the part of their husbands. Men may consider these little attentions trifles, but with the majority of married women they make up the sum of life, for no good woman's heart, after she becomes a wife, can ever again go out into the world for the thousand little satisfying things which she considered so necessary for her happiness when she was a maiden. If she finds them not in her own little world at home, then she must go hungry, for she has chosen this one man from all the world."

ESMERALDA.

I have taken the liberty of using "Esmeralda's" letter as a text to my chats this month, although it may have been written to me privately, feeling the truth of what she says about a husband's thoughtlessness in regard to showing due appreciation of his wife. It is perhaps natural to both husband and wife to neglect those little attentions that make the honeymoon so charming, when real life has come upon them with its manifold duties and perplexities, but let us wives be sure that it is not *our* fault, by losing no opportunity of giving a kind word or a caress; even if there be no responses, it will keep alive that spark which dies without a little fanning, and is as pleasant to the husband as the wife. Let me draw a picture I once saw when on a visit to a friend: A wife, with unkempt hair, no collar, slipshod slippers and in a hurry getting breakfast, children to dress, buttons off husband's shirt and things going wrong generally, breakfast late, toast burned, coffee muddy, etc., husband hurries off without a parting salute to any one, even the crowing baby is forgotten. And no wonder—an important appointment was broken and his business suffered in consequence of being forty minutes behind time. And yet that wife told me, in confidence and tears, that her husband neglected her, and she felt that his love was colder than of yore—saying, "how long would it take him, I'd like to know, to kiss us good-bys?" I felt and told her, that kisses must be spontaneous to be worth much and not forced from a sense of duty; and who could feel like caressing when in a hurry, with mind harassed and temper ruffled, with surely not so attractive an object to call it forth as she used to be during the first months of married life, when fewer duties devolved upon her, no babies to disturb at night or hurry her in the morning, and, with hair and temper unruffled she bid her new husband goodbye with a smile and he with a kiss. Oh, wives! let us try and keep the love of our husbands and blame ourselves if it grows cold; for as our duties multiply and call our utmost capacity and energy into play, do we not neglect much that would elevate and give pleasure to husbands who also have a "hard road to travel," many of them, and as expenses double, so do their cares also. To bear and forbear is the true way to live harmoniously and truly happy. And one word of advice—try always to keep the respect of our husbands and the love will follow; which is equally applicable to husbands. I hope to hear from the other sex on this subject, and as it is one of vital importance, the views of both sexes should be brought out to show how best to make married life a "success," as so many predict it a failure in this age.

PLUM LEATHER.

Although this season does not promise much waste fruit, still those on fruit farms often have more of a kind than they can well attend to. If plums, I would let them make *plum leather* of the pulp, which is very convenient for pies or sauce in winter. Wash the fruit and put in a large pan on the stove until heated through, or if very ripe and soft mash through a colander, and spread on clean boards to dry in the sun, covering with netting to keep off the flies and insects. Two days will dry it, when, with a knife to lift up the edges, you can roll it up and put in paper bags to keep flies out. To use it, wash and soak in water a few minutes only and it is ready. Made of peaches it is excellent; of plums is very good but sour.

COOLING DRINKS.

This is the season when cooling drinks are very acceptable. To my mind there is nothing equal to citric acid, which can be kept dissolved, and with sugar and a little oil of lemon you would find a cheap and easily-made lemonade, always ready and palatable. Citric acid being the acid of lemons, it is equally healthful in fevers and bilious complaints. Of late the drug doctors prescribe it in rheumatism.

Here are some recipes from my choice selection:

HOW TO MAKE AN INDIAN APPLE PUDDING.

Turn three pints of scalding milk into a pint of sifted Indian meal; stir in two large spoonfuls of sugar, two teaspoonfuls of cinnamon or ginger, a teaspoonful of salt, one teaspoonful of soda and one dozen sweet apples, pared cored and sliced thin. Bake three hours. The apples will form a nice, sweet jelly. To be eaten with nice syrup of any kind, or is good without any addition.

TO PREVENT LAMP CHIMNEYS FROM CRACKING.

Put the chimneys in a kettle of cold water and heat gradually until the water boils, and let it cool as gradually. As the heat from the lamp flame becomes more or less intense, the chimneys will expand and contract without causing them to break or crack.

TO REMOVE MILDEW.

The following from an English journal will often prove effectual: Make a very weak solution of chloride of lime in water (about a heaped-up teaspoonful to a quart of water),

strain it carefully and dip the spot on the garment into it, and if the mildew does not disappear immediately, lay it in the sun for a few minutes or dip it again into the lime-water. The work is effectually and speedily done and the chloride of lime neither rots the cloth nor removes the delicate colors when sufficiently diluted and the articles rinsed afterwards in clear water.

I clip the following from the *Country Gentleman*, and know them good:

CANNING TOMATOES.

Skin them carefully by pouring boiling water over them; boil twenty minutes in a porcelain kettle, then take out all the water that stands on the top (or if preferred thin only drain off a little of it). Have the jars heated by rolling them in boiling water; fill to overflowing with the boiling tomatoes and seal quickly. I use Mason's jars with glass lids and think them preferable to those with metal tops on account of the acid in the tomatoes. Mine last season were pronounced a perfect success. Keep in a dry, cool cellar.

This receipt is for glass cans; if tin, the wet towel may of course be omitted: Select nice large fruit, pare carefully without scalding, cut away all defective parts and place in a preserving kettle over a hot fire. Have the cans thoroughly cleansed and rinsed, and as soon as the tomatoes come to a boil place a towel slightly wrung from cold water on a tin plate on the stove hearth; set a can on the towel and fill with the hot tomatoes, being careful to keep the fruit as whole as possible. Press the fruit into the can, and when full put in hot juice till it will hold no more. Seal, wipe off the can and set it aside. When all the cans are cold put them in a cool, dark place. Ours are kept in the pantry.

APPLE DUMPLINGS.

Procure good sour apples, pare and core, leaving them in halves. Get all your ingredients—sugar, soda, sour milk, cream, salt, flour and apples. Now make dough as for soda biscuit, only adding a little more cream to make it shorter. Take a bit of dough out on the kneading board, and after kneading roll this as for pie crust. Then cut in pieces long enough to cove an apple, allowing for lapping the eages. Put in two of your apple halves, sweeten according to taste and cover apple and sugar with dough. Lay the dumplings in your bread pan the smooth side up, first having your pan well-buttered. Proceed in this manner until you get your pan well filled (be sure it is a large-sized pan for they will go off like hot cakes), then place a small bit of butter on the top of each dumpling, sprinkle a handful of sugar over all, then place in a moderate even and allow them to bake one hour. Serve, not too hot, with pudding sauce or with cream and sugar.

Familiar Talks---No. 3.

BY "SNIP."

I think "Jewell" is doing very well with her bread-making. I made bread every week for more than a year before I could feel sure that when the batter was mixed it would turn out good, sweet loaves. Of course every one offered a receipt and advice, but in this, as in everything else, experience is the best teacher. We are very fond of

LIGHT-BREAD ROLLS

or biscuits, as they are sometimes called. Following is the manner in which I make them always, and we think they are delicious: I mix the batter as for bread (if I wish to bake bread the same day I take a piece of the sponge) about seven o'clock in the morning. By ten it is ready to knead out. I repeat this kneading as often as the sponge becomes perfectly light. When ready to mould it into rolls I knead in a little white sugar to counteract any acidity that might have been formed by the long standing and a little butter for shortening.

CARE OF CARPETS.

"Nell Van" gives a suggestion for making carpets last longer than they usually do. I think sweeping wears out carpets faster than walking upon them does, unless, indeed, one has a house full of romping boys. Sweeping is hard work anyhow, and I do no more of it than is necessary. I have found that one way to save a great deal of labor in this direction is to have a

SCRAP-BOX.

Mine is a square tea-box such as can be procured at any grocery store. This box I keep under my sewing-table, and it catches all the scraps, threads and the like that would fall on the floor. It is convenient to place by the sewing-machine when you are at work there.

I notice that "Jewell" is allowed to ramble in her letters, so perhaps, Mr. Editor, you will allow me to do the same, and tell you that the extract from the *Rural New Yorker*, concerning the

USE OF SULPHUR

as a remedy for and preventive of vermin on chickens, has made one corner of my brain feel slightly muddled. I have tried it in every way that has been recommended without the least sign of success. Not only this, but I have tried everything that I could hear of. Have had the whole place smoked, washed, whitewashed, and have had the chickens, little and big, greased; but in spite of everything the vermin is there and seems determined to stay. Can any one tell me what is the matter, and how I shall get rid of the pest?

Why He Wants the Agriculturist and Live Stock Journal.

Elder J. W. Webb, of Lompoc writes as follows:

Stray copies of your journal have come into my house, and I wish it sent to my address regularly for three good seasons, viz:

1. I like it for its information—it is worth the money.

2. I see even my little girls "go for it," and it has a wholesome ring about it that will do them good.

3. It is not afraid to speak for temperance, that so much-needed reform; and as a man, a father, a minister, a teacher and a granger, I feel bound to support just such a paper.

Dear Uncle Ben:—I heard you want to have us write to you. I am a little girl seven years old, going on eight. I live in the country. Genie and I hunt eggs now. One day we got five dozen. We found a nest with six kittens in it, so fat and sweet. I help wash dishes and wipe them and I braided a mat. I read in the Second Reader. I have a kitchen and a little stove, a small set of dishes and a little towel. I have a big flag and so has my brother Freddy. It is taller than myself and nearly twice as big as Freddy.

GEORGIE JEWELL.

The simplest and best paint to prevent buried wood from decaying is made of boiled linseed oil and coal tar, into which charcoal is stirred until the whole is of proper consistency. Apply with an ordinary paint-brush.

Boys and Girls.

Minnie Tries to be a Lady.

A TRUE STOTY BY NELL VAN.

MAMMA'S HAT AND POLONAISE.

MINNIE'S mamma had been out to ride in the Park with old Mrs. Le Brun, and when she came home she found a friend in the parlor awaiting her return. Laying aside her hat and walking suit, she went in to her guest, while little Minnie, who had been feeling very unhappy at being left at home, resolved in her mind that she, too, would go pleasuring.

"Little girls love to go riding as well as big ladies," said she; "and I mean to go to Woodward's Garden and see the monkeys and walk among the trees and have a good time. Mamma has left her things on the bed, and I think I'll look just like a lady with them on, so that I can go just as well alone as with somebody."

She put mamma's polonaise on over her own, and it was not long enough to quite drag on the floor; then she put on the hat and feathers and surveyed herself in the glass.

"Oh, how fine I do look! now I'll do; but first I'll scent myself with her perfume. Mamma always puts it on her face and hands to make her smell nice when she goes out."

She was soon ready; then slipping out the front door she stopped a street car going to Woodward's Garden and was soon whirling along past the city houses. There were several ladies and two men in the car. They wondered at the querr little figure who stepped in so daintily and seated herself so demurely, but it was not till they reached Woodward's that it was known that the child had no money, for the lady who sat next her had paid her fare to the conductor and had been more amused than the rest at Miss Minnie's affected ways. Thinking, however, that the child must have some friend in the vicinity of the garden whom she had been allowed to go to visit, she asked her no questions.

When the cars stopped out stepped Minnie, and mincing up to the entrance she attempted to pass in, when she felt herself roughly handled by a man with a big star on his coat front. "Here, my little miss, where are you going? where's your nurse? Don't you know

you cannot come in here alone without money ?"

Alas ! Minnie had forgotten, or was too young to understand, that money is power, and is more necessary to make one's way through the world than anything else.

She was asked where her home was and led to the returning car and sent back to town. Heart-broken and almost crying aloud, the little girl sadly took her seat and forgot all about her fine clothes in her disappointment at not being allowed admittance into her favorite resort, Woodward's Gardens.

The car soon passed the corner where Minnie lived, and the kind conductor let her out and smiled at the child's frankness in acknowledging that she had no money or car ticket. She stepped down and sheepishly slipped into the house by the side gate. She found the house in an uproar because Minnie was gone, and when mamma espied the little figure entering the dining-room decked out in borrowed finery, in spite of her anxiety and annoyance, she threw herself backwards upon the lounge and clasping her hands laughed outright.

Minnie stood on the threshold looking from her mamma to nurse and then to the cook, and never ventured to smile. Then, turning on her heel, she fled upstairs, muttering to herself, "cheated out of it this time, but the first chance I get I'm going again, but I'll take her purse next time and then nobody'll know that I aint a lady; so there!"

Letters From the Young Folks.

Dear Uncle Ben:—Are you truly Uncle Ben to all the boys and girls whose fathers and mothers take the Agriculturist? but you can't be Uncle Ben to everybody, I guess, for Johnny, a boy I know, says his Uncle Ned is not uncle to anybody but him. I would not be so mean if I was he, would you? And what for do you ask us children to write you a letter ? is it because you like children? Haven't you got any of your own? If you had I guess you would not care for any one else's to bother you. I cannot write very good but mamma says I'm a master hand at asking questions, and tire her out. How can I help it, I should like to know. If folks didn't ask questions how could they ever know things that don't come in books. I should never know anything, I do believe, for I do not love to read very much. I suppose that is because I always have to stop and spell the big words, and that makes me forget what it was all about. I don't know how to write letters to anybody; but once our girl got sister to write a letter to her mother in Ireland and told her just what to say, and it began this way—"I now take my pen in hand to write to you." I thought that a funny way to begin. Of course a body knows that a letter written in ink must be written with a pen in the hand.

But I forgot what I was going to tell you when I commenced this letter. First, I want to tell you about a little girl I know named Fanny, who has a little brother Jim. One day they went out somewhere with their papa and saw a little tiny man who was just like a small boy dressed up in little men's clothes. When Fanny came home she told her mother about him like this: "And he had a little coat and vest, and a little watch and chain, and he had a little cane and a little stove-pipe hat, and little boots and a little great coat, and a cigar in his mouth. He was *such* a funny little man!" Then Jimmy came up and said, "and he had a itty toat, and he had itty pants, and he had itty boots on his feet, and he had a itty tane, and he had a itty hat on top of his head, and a *stove-pipe in his mouf;* such a funny itty man, Mamma!" How everybody laughed! I mean to get Fanny to write to you some day, and tell you about her little brother who makes us laugh so much.

I wonder if you are tall and slim, with black beard like a shoebrush under your nose. Maybe you are like Grandpa, without any hair on your head or face except behind your ears. I wish I could see you, for I do believe you are real jolly and laugh all over when you hear anything funny. I like jolly folks who don't be cross to children. I often wonder if some folks ever were little boys and girls, they are so cross to little folks now. But there's the dinner-bell so I must run. Pa says we must never be late to dinner, so goodbye. From your niece you've never seen,

Gerty W.

Dear Uncle Ben:—I thought I would write you a few lines about my home in Santa Maria Valley and what we are doing. At present I am out on vacation. I stay at home and mother and I run the ranch while father is off with his thresher.

It would make you laugh to see me get on the old mule to drive in the cows. We milk eleven night and morning. But the funniest part of all is to see me shoot gophers. The first time I ever shot off a gun I saw an old gopher right in the middle of my flower-garden. I went to the house and got the gun and got all ready to shoot, when I thought it might kick me over like it did father once; but then I did not care much, so I shut both my eyes, commenced to shake, pulled the trigger and shot the gopher. That gave me courage to "try, try again," and I can shoot them every time now.

We have a few horses, cows, sheep and hogs which are all pets. When we go in the field where they are they all come to us to be petted. Sometimes we will take no notice of them just to see the fun. Then the horses will commence to pull our clothes, the cows will rub around and the sheep pull at our fingers, and they will keep it up till we pet them.

We have a nice school-house down here, and have good times when we go to school. We have a paper in school. It is called the Youth's Assistance and all the scholars write for it.

And now, Uncle Ben, you must please excuse bad writing, for although I am fourteen I have not had the advantages of school that city girls have had, and I know I am a very poor writer.

If Jewell had not had so many receipts for making bread I should have sent her one, for I can make good bread.

Next month I hope my letter will be more interesting, for I will have more time.

Ella.

Dear Uncle Ben:—I heard the folks say you would like little boys and girls to send you letters to put in print in the Agriculturist. I have to herd the cattle in the field. We have fourteen cattle and I have got a little saddle to ride with. I know two girls that are afraid of a hen, but I am not a coward. I can ride on horsebrck. We have got a little kitten that climbs up on our clothes. I have got a little writing-desk, and I am in the little spelling-class. I have a little looking-glass, too. At school I study pretty hard and never play. I have a tin water-cart and I play with the greyhound. We have a barn full of hay and the hens lay eggs in it. Goodbye.

Eugene Woodhams.

Stock Breeder.

The Leading Breeds of Cattle.

BEEF BREEDS—THE SHORT-HORNS.

It is unnecesary to give any detailed account of the origin and history of these celebrated cattle. Wherever beef is consumed—and where is it not?—they have played an important part in supplying the wants of man. They are known from one end of the country to the other as the Royal Family among cattle; and no breed dares dispute with them their merited position at the head of the list. The Short-horn has been termed the rich man's breed; and at present prices the "fancy" of his kind could hardly become the property of a poor man without bankrupting him. There is a mania just now for Dukes and Duchesses, and matter-of-fact farmers are disposed to discover something fishy about the immense prices realized, at recent sales for members of this family.

There is no reason, however, why we should mark a man a fool because, for reasons best known to himself, he chooses to invest a large sum of money in a small amount of beef. He may have lights before him which have not shone upon us; and although we may not choose to go and do likewise, we have no special interest in the matter, and can act upon our own instincts. We cannot indulge ourselves in such expensive luxuries as Duchesses and Dukes; but we can, at a small outlay, replace every scrub bull that ranges the prairies with a well-bred yearling or two-year-old Short-horn. That will commence the era of reform from the time he steps among the herd.

The natural home of the Short-horn is on the rich grass lands of the West. Here he thrives amazingly. At two years old he has so waxed in strength and fatness that he is prepared for the shambles, when the scrub-stock of the country is lingering between beef and veal. That is what we want—aptitude to carry flesh and early maturity. Without these no man can raise beef at a profit.

The modern Short-horn is not a milker, although descended from the most noted dairy cows of the last century. Breeders have so entirely lost sight of the dairy qualities of the animal in the effort to secure symmetry of form and a propensity to fatten, that it is now customary, among many of them, to "nurse" their calves on cows kept for the purpose, the mother not being able to afford sufficient nourishment. These, however, are fancy notions which are not expected to meet with much favor on the prairies; and bulls selected as breeders for the farmers "out West," would seldom have time to brush up for exhibition at the fairs, and the dams of their young ones would have no difficulty in suckling them, being neither of aristocratic lineage or delicate constitutions. The grazing portions of the State should be well-supplied with good Durham blood; and if it could be gradually accomplished without too violent an interference with the rights of individuals, we would favor the castration of all the little pestiferous, ill-shapen Texas bulls that dare attempt to repeat themselves.

HEREFORDS,

As their name indicates, came from Herefordshire, England, and are the only prominent rivals of the Shorthorns in size and aptitude to carry flesh. They are a large, long-horned cattle of peculiar color, white about the face, belly and legs, the rest of the body being bright red. They have not succeeded in exciting much enthusiasm in the United States, though recent sales show that small herds have been carried as far west as Colorado and seem to meet with favor. Their admirers give statistics to show that they have, in many instances, competed successfully in the

same rings with short-horns at English fairs, and the small amount of food they require to keep in good condition and their grazing qualities are urged as reasons for their more especially answering the wants of the practical farmer and grazier. Our experience or knowledge in regard to Herefords amounts to little or nothing. It has sometimes been said that they would keep fat where a Short-horn would starve and a Devon grow thin; and we are told by a gentleman who has bred all three, that from his experience, he has no reason to doubt the truth of the assertion.

DEVONS.

We consider the Devon as occupying the same relative position among cattle that the Southdown does among sheep. He is the hardy, active, square-bodied, compact little beast that stands between the giants and the pigmies, requiring little nursing and able to take care of himself, and yielding, yearly an ample return for all the food he consumes. They are of a dark red color, with wide-spreading, straight horns, breed and mature earlier than the larger kinds of cattle, and are particularly desirable on poor pasture lands, where activity is necessary to enable an animal to earn his daily food. Their flesh is said to be superior for beef, the lean and fat being well-mixed; and they frequently enter the lists in England in competition with Short-horns and Herefords, and carry off their share of the prizes.

There are many other kinds of English cattle more or less esteemed, such as the West Highlanders, Polled Galloways and Sussex; but few of these have found their way to America, and do not stand in the front rank with those already mentioned.

DAIRY BREEDS—THE HOLSTEIN OR DUTCH COW.

Although there seems to be some difference of opinion existing between the breeders of this stock in the United States upon the subject, there is no doubt that it originated in North Holland, and that most of the animals known as Holsteins were imported from that section of country. This breed has long been famous for its milk-producing powers, and some of the accounts which come to us of their performances at the pail border upon the marvelous. They consume large quantities of food and carry little flesh when in milk. When dry, it is said, they lay on fat with rare rapidity, and for this reason should exactly suit the milk dairyman, who buys his cows in milk and sells them, when dry, to the butcher. The Holsteins are large, well-turned cows, with crumpled horns of medium length, large udders, and are usually black and white in color. The number of Holstein breeders in the United States is comparatively small. It is only of late years that much attention has been given to this useful kind of dairy animals, but if all we hear of them be true, the time is not far distant when they will become the most popular and generally distributed milk cattle in the country. A Herd Book for the record of Holstein pedigrees is published under the auspices of the Association of Breeders, in Massachusetts. Should any of our readers desire further information on the subject, they can obtain it by addressing W. W. Cheney, of Belmont, Massachusetts, the President of the Association.

AYRSHIRES.

The Ayrshire, if not the best dairy cow, is certainly the most fashionable and popular just now. She is the result of intelligent breeding, long continued in the noted dairy district of Ayr, Scotland, and it is claimed that her milk will produce more cheese to the pound than that of any other breed of cows. The quantity, of course, varies with circumstances; but all things being equal, her admirers assert, with show of reason, that she will yield more milk to the amount of food consumed than any of her rivals. Ayrshires are medium-sized, wedge-shaped cattle, ordinarily red or brown and white, with fine heads, upright horns slightly curving in, and broad, straight backs. Their udders should be square, running well forward, and teats set widely apart. The shortness of the teats has been frequently urged as a strong objection to the breed; a defect, however, which would not amount to much if the flow of milk is constant and in sufficient quantities. Ayrshire steers fatten readily and make good beef. While not prepared to compete with Shorthorns or Herefords, they command good prices in the market and make a fair return for what they consume. An Ayrshire cross upon native stock would result in decided improvement, and when the prodnce is intended for general purposes we would highly recommend it.

JERSEYS OR ALDERNEYS.

It has not been very long since, when, to have advertised the merits of these little animals whose distinctive name we have just written would have secured a laugh of derision from an audience of western breeders. Alderney was synonymous then, and is still to a certain extent, with self-satisfied, would-be wiseacres, with everything little and ill-shapen and scrubby in the cattle line. "Them little yaller cattle," as they are derisively termed, have nevertheless, by dint of sheer merit, pursued their way along the line of emigration till individuals of the breed are owned and esteemed from the Atlantic to the Pacific.

The Jersey is small, bony and active. She varies in color from almost black to brown, gray, fawn and light red, these colors being variously mixed with white in various animals. She is hardy, very prolific and matures early. She is noted for a deep yellow skin and stands unrivaled as the butter-maker of her kind. Jersey bulls crossed upon native cows produce the best family cows, all things considered, to be had. They grade up rapidly, and it is frequently difficult to detect any difference between a half or three-quarters bred animal and a thoroughbred. As "little" and as "yaller" as they are, they admit of no rivalry in their chosen sphere. They have generally been derided by beef breeders since time immemorial for their inaptitude to carry flesh, a high recommendation to any one who has studied intelligently the characteristics of good dairy cows. By some the Jersey has been compared to a goat, who gives a quart of rich milk and is otherwise good for nothing—a quart of rich milk is better than a quart of blue milk, at any rate—but a little enquiry will satisfy the most incredulous that modern Jerseys not only produce an unequaled quantity and quality of butter, but that their flow of milk is quite as large as that of the other breeds, in comparison with their size and the amount of food they consume. A recent letter from B. F. Johnston, the old and reliable correspondent of the *Country Gentleman*,, calls attention to the fact that Jersey milk is, more than that of any other breed of cows, devoid of casine, the most indigestible ingredient of milk. He draws from this fact the conclusion that for the use of families, and especially of children, it should be preferred to all others. In the vicinity of large cities, towns and villages, wherever the great desideratum is a fair quantity of rich milk at little cost, the Jersey cow will "pay." The grades, as already said, are excellent family cows, and are fast superseding natives where their good qualities are known and appreciated. It is as well to state here as elsewhere, that in breeding cattle we must set aside partialities and fancies and secure what we know will answer our wants, without regard to the opinions, so strenuously asserted, of men who have run in their ruts till they can't see over the sides. It would be asking too much to expect a grazier or butcher to admire a Jersey, as it would be to expect a dairyman to look for his milk supply from a Texas steer. It is well to remember that animals bred for special purposes are more apt to accomplish special ends—jacks of all trades are good for none. The Jerseys, Alderneys and Guernseys differ in no material respect. They are the same race of cattle, coming from the three islands, Jersey, Alderney and Guernsey, as indicated by their names. By far the greater proportion of these cattle in the United States hail from Jersey; in fact, the American Jersey cattle club, by whom the matter of pedigrees is regulated, will admit none that cannot be traced back to animals imported from that island.

SWISS CATTLE.

The cows of Switzerland have long been noted for their superior dairy qualities, and have, in a few instances, found liberal admirers who have imported them to this country in small numbers. Several fine herds are owned in New England, and judging from the soil and climate of their native country, we should consider them particularly well adapted to that part of the United States. Our information concerning their success in America is limited, for the reason that their owners have taken no pains to make the public acquainted with their merits. They should be profitable in the broken and rather mountainous sections of this State.—*Missouri Agricultural Report*, 1874.

Live Stock at the Centennial.

It is understood that the Centennial Commission has concluded to have the live stock display at the International Exhibition within the months of September and October, 1876, the period devoted to each class and family being fifteen days and the division as follows:

Horses, mules and asses, as one class, from September first to fifteenth.

Horned cattle, of all varieties, from September twentieth to October fifth.

Sheep, swine and goats, as one class, from October tenth to twenty-fifth.

Poultry will be exhibited as a permanent, and also as a temporary show, the first commencing on the opening of the Exhibition, the latter from October twenty-fifth to November tenth.

Animals must be of pure blood to be qualified for admission (trotting stock and fat cattle excepted), and even those of pure blood must be highly meritorious.

The exhibition being open to the whole world, it is of the first importance that we bring forward the best of their kind only, as the character of our stock will be judged by the general average of those exhibited.

Exhibitors will be expected to provide for feeding their stock.

All forage and other food will be furnished at cost prices at depots conveniently located within the grounds.

Exhibitors will also be expected to furnish their own attendants, on whom all responsibility of the case of feeding watering and cleaning the animals, and also of cleaning the stalls, will rest.

Though the Commission will erect ample accommodation for the exhibition and protection of live stock, contributors who may desire to make special arrangements for the display of their stock will be afforded facilities at their own cost.

All animals will be under the supervision of a veterinary surgeon, who will examine them before admission to guard against infection, and who will also make a daily inspection and report.

In case of sickness the animal will be removed to a suitable enclosure, specially prepared for its comfort and medical treatment.

Rings will be provided for the display and exercise of horses and cattle.

It is highly important that all who design exhibiting should now make application, as the extent of preparation necessary can only be regulated by an estimate based upon actual demands.

Inquiries may be addressed to the Chief of the Bureau of Agriculture, Philadelpeia.

Porcine.

Hog Raising.

WHEN properly managed, there is no more profitable stock business in this State than raising hogs for pork. Hogs increase here much faster than any other class of stock. Sows will breed on an average twice a year, and after they are one year old will average from six to ten pigs at a litter. At a year old these pigs are ready for the market, and are always in demand. Indeed, there is no day in the year when there is not ready sale for good porkers. The Chinese always eat and will always have pork. Pork is also worth more in proportion to the cost of production than any other meat. Hogs in this State will live the year round by grazing, and do well at that. Alfalfa is the best grass or clover for hogs. They will reject all other grasses or clover for alfalfa, and will thrive on it from the time they are two months old. The sows will give a good supply of milk for pigs on this clover alone, and keep in good condition. At one year old good Berkshire hogs will average 200 pounds with no other feed than good alfalfa pasture, and will be as fat as the Chinese markets require. From the above it will be seen that for each one year old sow and good alfalfa fields the farmer can make an annual increase of from twelve to twenty fold on original stock. If in connection with alfalfa he raises barley or wheat, he makes the hogs gleaners of the stubble to good advantage, thus turning into pork and money much that would otherwise be wasted. But barley or wheat may very profitably be raised especially for hogs, and the hogs will do their own harvesting. By the use of portable fences, a portion of the field may be fenced and the hogs turned in as soon as the grain is in the dough, and as fast as the grain on this portion is consumed, or nearly so, another portion may be fenced and the fattening hogs turned into this, and so on until they are fat and ready for market. The store hogs may follow the fatting hogs, and in this way the harvest may be completed and turned into meat without the expense of reaping, stacking, or threshing, or freighting to market. What is more, grain thus made into pork finds, as we said before, at all times, a ready home market, and does not have to be sacked or freighted to Liverpool or any other foreign country at great expense. The expense of running a farm stocked with hogs, after the same is well seeded with alfalfa, and fenced into appropriate sized fields, is comparatively light. The same value may be turned off annually from such a farm with one-fourth the labor and expense required to run a grain farm when the grain is harvested and marketed in the usual way. Our river farms are especially adapted to hog raising. The land is good for alfalfa and barley, and these farms generally have tule lands connected with them, on which may, at very little cost, be raised large crops of pumpkins, which also make most excellent feed for hogs, and which to a great extent may also be harvested by the hogs themselves. Good judgment and care are as necessary to this business as in any other, but with these we believe it to be about the most profitable branch of farming in the State.

PRECAUTIONS.

Among the necessary precautions to insure success in the hog raising business may be mentioned, first, the care of the young. Pigs are hardy and easy to raise, but they require a certain kind of care which cannot and must not be neglected. During all the wet season, at least, each sow and pigs should have a separate pen, and a good, warm, dry nest to sleep in. They should also be bed separately until the pigs are, say six weeks old. If any number are allowed to sleep in one common nest in cold, wet weather, losses will most surely occur by smothering by the sows lying on the little ones or by fighting. Small pigs should be kept shut up in a pen until three or four weeks old. Until that age the sow should be turned out daily a part of the day, and after that the pigs may be allowed to accompany her, but should be shut up nights until, say six weeks old. If large numbers of pigs are fed together, or if pigs of different ages are fed in common, the stronger are bound to take advantage of the weaker, and this will create runts or scrubs, which will always be runts or scrubs, and these, if allowed, will materially dimish profits. Some special care must be taken of the pigs when weaning them. The sows will generally wean them at about two months of age of their own accord. If the feed be good, the feed of the sow may be withheld when the pigs are six weeks old. When this is commenced the pigs must have a little extra care and feed. For this purpose a pen may be so arranged that the pigs can get into it, while the sows are excluded. In this pen may be kept a little wheat or rye bran, or other good, nutritious food. The pigs will soon learn where the hole is that leads to this food, and will pass through frequently and help themselves. None but the black breeds of hogs should be raised in this State. All others are liable to the scurvy. The best breeds are the Berkshire and the Essex, or these two breeds mixed. These breeds, if properly cared for, are proof against the scurvy, and are the best grass-eaters, and are plenty large enough for profit. One of the most necessary precautions to insure success in hog raising is cleanliness. The hog is a dirty or clean animal, according as he is treated. Whenever kept in a pen, if given a chance, the pig, big or little, will keep himself clean, and he should be encouraged in this natural instinct. Instead of a mud-hole to drink out of, he should, whether in pen or field, be furnished with clean, cool water to drink. Salt and charcoal should always be kept where hogs can help themselves whenever inclined to do so. Both these articles are a necessity to hogs of all ages and conditions, and their plentiful supply at all times has more to do with the good condition of the hog than most hog raisers of experience imagine. —*Record-Union.*

ABOUT ADVERTISING SWINE.—Under the heading of "Why Is It?" the *Swine and Poultry Journal* has the following suggestive paragraph:

It seems to us that the white breeds of swine must be extinct, or else no one is breeding them for sale. The Berkshire breeders seem to be the only live swine breeders in America. They are the only men who have enterprise enough to advertise to any extent, and in consequence are reaping the reward of their good management in increased sales and prices. We have ten inquiries for the names of Berkshire breeders to one of any other breed; next following in number is the Poland China, with once in a while an inquiry of "Who breeds Suffolk and Chester Whites?"—and as we refer all such inquirers to our advertising columns it is very evident the Berkshire breeders get the best of it. We are surprised at the lack of interest and business tact of interest and business tact of swine breeders, as compared with the breeders of all other kinds of improved stock. By a careful examination of the advertising columns of thirty agricultural and stock papers, we find the proportion of swine breeders who bring their stock before the public by advertising to be about one-tenth that of cattle and one-thirtecuth that of poultry breeders. Surely if it pays poultry breeders so well to advertise (and all admit that it does pay), it would pay swine breeders still better. We find poultry and cattle breeders, also, ever ready to write and tell the public about the useful and economic value of their stock, best manner of breeding and rearing it, and the best breeds for certain localities; but it seems impossible to get a swine breeder to let the public know anything about his stock.

BERKSHIRES.—Says the *Live Stock Journal*, which is one of our best authorities on stock:

The Berkshire is probably the nearest thorough bred among swine, and in that class is like the Arabian among horses. It is undoubtedly the highest type of hog. They have all the good qualities, are good breeders, good mothers, mature early, fatten easily and at a young age, and can live on clover and grass almost as well as sheep.

Some people have a prejudice against the black color in swine, and would on that account object to either the Berkshire or Essex.

Parasites in Bird Cages.

Many a person has watched with anxiety and care a pet canary, goldfinch or other tiny favorite, evidently in a state of perturbation, plucking at himself continually, his feathers standing all wrong, always fidgeting about, and in every way looking very seedy. In vain is his food changed, and in vain is another saucer of clean water always kept in his cage, and all that kindness can suggest for the little prisoner done; but still all is of no use, he is no better—and why? Because the cause of his wretchedness has not been found out, and until it is other attempts are but vain. If the owner of a pet in such difficulties will take down the cage and cast his or her eyes up to the roof thereof, there will most likely be seen a mass of stuff looking as much like red dust as anything; and from thence comes the cause of the poor bird's uneasiness. The red dust is nothing more nor less than myriads of parasites infesting the bird, and for which water is no remedy. There is, however, a remedy, and one easily procured in a moment—fire. By procuring a lighted candle and holding it under every particle at the top of the cage till all chance of anything being left alive is gone, the remedy is complete. The pet will soon brighten up again after his house-warming, and will, in his cheerful and delightful way thank his master or mistress over and over again for this, though slight, to him important assistance.—*Land and Water.*

It is a strange fact that when people indulge in high words they lose low language.

The Dairy.

The Quality of Butter.

Dr. GRISCOM says in regard to butter: I have the highest respect for butter, eaten in its natural state. It is very complicated in chemical compositions; each globule, though on an average only 1-5000 of an inch in diameter, being formed of an onter film or shell of caseine, with a mixture of different kinds of oil, each of which is again composed of an organized substance, known in chemistry as the oxide of glycerine, combined with a separate acid. Each globule in a recent state is distinctly visible in the field of the microscope, and when in unbroken integrity is sweet and digestible; but when old or broken, its chemical character alters, new compounds are formed, and the nutritive property undergoes a change. Time alone will effect this change, but there is another element which will produce it rapidly, viz., heat; and hence the melting process must so alter the relations of its chemical constituents as to impair its assimilative properties.

The substitution of cream for butter in cooking will, of course, obviate all objections to the latter in a melted form, and only this, but you will infuse into the food, with the cream, other nutritious ingredients, such as a portion of the caseine of the milk, which is albumen in a soluble condition—and more or less of the sugar which is also found in milk. A more innocent article than cream, or one more digestible and nutritive in cookery, can hardly be mentioned. There can be but one objection offered to the substitution of cream for butter, and this is its comparative inconvenience. Cream is far less expensive than butter.

Setting Milk.—The discussion on the subject of deep or shallow setting of milk having lately been re-opened, the *Country Gentleman* gives the following report of a committee appointed by a Farmer's Club in Bucks county, Pennsylvania, to make a comparative trial of the two plans. The trial was conducted in the dairy house of Eastburn Reeder:

The pool for deep cans is 36 inches long, 12 inches wide, and 20 inches deep, holding 36 gallons of water. This pool is filled with melted ice water flowing from the ice-box in the top of the refrigerating or cooling cupboard, and when it is filled the surplus water is conducted in pipes to the drain, and passes out of the building. The melted ice water keeps this pool at a temperature of 58°. Four deep cans were expressly made for the purpose, 8¼ inches in diameter and 20 inches deep, capable of holding 5 gallons or 20 quarts of milk, if filled to the brim; but 18 quarts of 4½ gallons fills them 18 inches deep, which is quite as deep as they should be filled for convenience in handling. A "conical-shaped dipper," of the approved pattern, was also made for dipping off the cream from the deep cans, and likewise a large kettle, capable of holding 10 gallons, in which to mix all the milk used in the trial.

The trial commenced on Monday morning, August 19th, 1874. On account of a scarcity of milk in the mornings, but 8 gallons were used at a time during the trial. Four gallons of measured milk were put in one deep can, filling it just 16 inches deep, and weighing 34 pounds. The same quantity of this previously mixed milk, by weight and measure, was put into four ordinary tin milk pans (4 quarts to the pan), and filling them three inches deep. This was repeated for 14 milkings, one week, making a total of 476 pounds, or 224 quarts of milk, 16 inches deep in 14 cans, and the same amount in 56 pans 3 inches deep.

The water in the pool, as before stated, was at a temperature of 58°; when a can of warm milk was immersed in it, it raised the temperature to 60°, but by the expiration of 10 or 12 hours it would be lowered to 58° again by the inflow of fresh ice water. A piece of ice was put in the pool after the first day, so as not to let the temperature be varied any more than could be helped. The pans of milk were set on a stone floor where the temperature was 60°. During the whole trial the temperature ranged as follows: In the pool, from 58° to 60°; in the milk room, from 50° to 68°. Great care was taken to preserve the uniform temperature during the whole trial, admitting cool air at night and excluding the warm air during the day, which necessary feature is under complete control. The milk in both cans and pans stood 48 hours, when it was skimmed. The cream raised one inch in depth in the deep cans. The amount of cream obtained from the deep cans was 46 pounds; from the shallow pans 57 pounds. The last skimming was done on Tuesday evening, August 18th, when the cream was placed in a cooling cupboard and the temperature lowered to 54°. The churning was done Wednesday, August 19th. The 46 pounds of cream obtained from the deep cans was churned first—butter came in 30 minutes, and yielded 15 pounds 10 ounces. The cream from the shallow pans (57 lbs) was churned immediately afterwards—butter came in 50 minutes, and yielded 21 pounds 6 ounces. The result of this experiment, which was conducted as fairly as possible indicates a gain of 5¾ pounds in favor of the shallow pans, or over 25 per cent.

The milk used in this trial was the product of three thorough bred Jersey, two Guernsey, and three grade cows, and averaging over 5 pounds per cow, if all the butter had been obtained from all the milk. The difference in time of churning is attributable to the churn being overloaded with the cream from the shallow pans. The butter from the deep cans was pronounced by some to be a trifle the best, although both would rank as strictly first-class. The dairy-house, in which the experiment was conducted, has been so fully described that nothing more is necessary than that particular. It is especially adapted for convenience and the making of gilt-edge butter, being both cool and dry. The floor had been washed on the morning of the 19th, and was perfectly dry by 11 o'clock. The cooling cupboard under the ice-box is provided with slate shelves, on which the butter is placed to harden before being sent to market. The pool, before mentioned, is a very suitable place to keep the cream before churning, as it should be kept at a lower temperature than the milk. It is not built so much under ground as to make it tiresome in carrying the milk in or out of it; in fact, we, after giving it a critical examination, are unable to tell how it could be improved.

Watering Milk to Get the Cream.—It is well known that milk set in the usual way, although it throws up a good percentage of cream, does not yield up all the fat in the milk, because the skimmed milk, on being subjected to analysis, is found to contain a small percentage of butter, notwithstanding it had on being set thrown up the cream very perfectly. Experiments that have been made in adding water to the milk to facilitate the rising of the cream, have shown that more cream is obtained. Thus a specimen of milk was divided into two portions. One portion was set for cream, and seven hours yielded 7 per cent. of cream. The other portion was mixed with an equal volume of water and the diluted milk set for cream. The diluted milk in seven hours gave 5 per cent. of cream, or 1¾ per cent. more cream than it should have yielded if watering made no difference. It may not be advisable, however, to use the water in this way on all occasions for getting up the cream, since water added to milk hastens the acidity of the liquid, which in warm weather should be guarded against.—*Rural New Yorker.*

Mistaken Policy.—Many farmers entertain the opinion that a cow gives the largest yield of milk when she is poor in flesh, in low condition, and this we suppose explains the reason why we see so many wretched, poor and half starved cows coming out of the barns of this country every spring. But a more careful observation of the points connected with the condition of the cow will invariably show that this cannot possibly be the case; that if the condition is low, the system emaciated, the yield of milk is of necessity comparatively small, that is, small to what any particular cow would be capable of yielding on the same food were she in better condition; and if the yield is large in quality it will be poor in quality, because much of the food which should go to yield milk will necessarily be drawn by the animal to maintain its bodily condition. This point has too often been overlooked in considering the true economy of dairy management.—*Mass. Ploughman.*

The *New England Farmer* says: The milk of some cows, yielding a large quantity of milk and but little cream, will actually prevent the cream from rising on the milk of cows which is rich in cream! This we learned from long, actual experience, and from repeated vexatious losses which occurred before we did learn it.

Anomalies.—Paper can be manufactured from iron. If a tallow candle be placed in a gun and shot through a door, it will go through without sustaining injury; and if a musket ball be fired into water, it will not only rebound, but be flattened; if fired through a pane of glass it will make a hole the size of the ball without cracking the glass; if suspended by a thread it will make no difference, and the thread will not even vibrate. Cork if sunk to the depth of two hundred feet in the ocean will not raise on account of the pressure of the water. In the Arctic regions when the thermometer is below zero, persons can converse more than a mile apart. Dr. Jamison asserts that he heard every word of a sermon at the distance of two miles.

No farmer is excusable who makes his field work a reason for not attending to the vegetable garden. A good supply of vegetables in their season is worth much in money and health.

When love fails, we spy all faults.

The Horse.

More System Wanted in Breeding Horses.

In our last number no less than three correspondents suggest that our breeder are overlooking form and action and running to mere size. By one of these intelligent observers it is insisted that, even in draft horses, it is not profitable to make everything subservient to mere weight.

The English agricultural horse, so called, is usually the large black cart horse, weighing 1,500 to 1,800 pounds, and sometimes even more. The Clydesdale is nearly as heavy, with a little more style and action. These horses, or the heavy Normons, have never been classed as agricultural horses with us. American farmers cannot use horses that are too heavy to make six or eight miles an hour on the road.

Why then, it may be asked, are the heavy-draft horses of the three varieties above mentioned so generally patronized by our farmers?

There are two reasons for it. First, and most important, is the undeniable fact that in many parts of the country the half-bred draft stock sells for more money, and may be brought to market at an earlier age, than any other strain the farmer can breed. They will sell at three to four years old at from $200 to $300, while a good, well-made and well-bred road or saddle horse will hardly make $150, unless he have something to indicate extra speed.

It is probable the draft stock eat more, the amount consumed by all animals being generally in proportion to their size. But they are less liable to accidents than horses of better blood, more easily handled and are fit for market without being broken at all.

We may therefore philosophize as we please —point out the excellence of well-bred stock for the saddle and the road, and even for general purposes—the fact remains that the heavy sort will make the most money for the farmer when he puts them upon the market; and therefore he breeds them.

How long this demand for draft horses will continue to equal of very rapidly-increasing supply, we will not pretend to predict. To avoid loss when the decline does come, we would advise the intelligent farmer to keep up his old stock of well-bred, general-purpose horses. These he can always use, and they will be sure to pay their way, on the road or on the farm; and the produce of well-formed mares of this sort 15 to 16 hands high, not too long in the leg, from stout, thoroughbred, or nearly thoroughbred stallions, will always be in demand at some price.

In reference to the suggestion of one of our correspondents, that we should select draft stallions of more action and less size than has been the prevailing custom of late, we are of the opinion that the time has come, even in this class of horses, that we must look to the form and movement, as well as weight.

If we were going to breed to a draft stallion, we should certainly select one of the smaller size, with bony, clean cut head, well set on a properly-formed neck, flat legs and general conformation indicative of action, in preference to a large, heavy-headed one, with low, thick and upright shoulders, large, round legs, etc.; though it must be confessed that horses of this latter description have been bringing quite as high prices in the market as any others. But we think it will hardly do to depend upon this as a permanent feature in the draft-horse market. Gradually form and action, and even style, will attract attention here, as in other classes.

It will be observed that we have only spoken of what the *farmer* has been doing, and the probability of his future operations in breeding horses.

We have not referred to the professional breeders, who, for the most part are handling only thoroughbreds or trotting stock. As to these, we would respectfully direct their attention to the great need there is, and the great demand we may soon expect, for well-bred stallions for breeding good horses of the general-purpose class. Cannot these gentlemen, who have so much taste for the best type of that wonderful animal known as the thoroughbred horse, work out the great problem of producing from this matchless blood the basis for a great strain of general-purpose horses?—*National Live Stock Journal.*

The Poor Mule.—The amount of fatigue, exposure, and abstinence, which a mule will endure, says a writer, seems almost fabulous. Making long marches across dusty, shadeless plains, going for long intervals without water and with very little food, obliged to pull loads sometimes amounting to five thousand two hundred pounds, up steep hills and through heavy sloughs, subject to cruel treatment and neglect from the teamster, the life of an expedition mule is miserable enough. No wonder when the mule returns he looks woefully angular and thin. The poor animal is frequently driven until he completely gives out, when he is thanklessly turned into the herd of broken down mules.

There is scarcely a more melancholy sight than such a herd. It is a moving bone-yard. Gaunt, lean, with drooping ears, hips that rise like promontories above the general desolation, a disconsolate tail, and a woebegone vssage which would frighten an experienced ghost—the poor worn-out mule is the most wretched parody on Gothic architecture that ever was forced on the public attention. Every vestige of meat has fled from his bones. He is a walking transparency, an animated hat-rack, and I have actually seen his hip bones irreverently used to hang teamsters' hats on.

During our homeward march from the Black Hills, more than one such starved victim laid down his tired frame on the earth that had refused to nourish him, and the benediction of a soldier's bullet called the raven and coyote to a meal which it cost the Government one hundred and forty dollars to procure.

Care of Horses.—The London *Horse Book* says: All horses must not be fed in the same proportion, without regard to their ages, their constitution and their work; because the impropriety of such a practice is self-evident. Yet it is constantly done, and is the basis of diseases of every kind.

Never use bad hay on account of the cheapness, because there is no proper nourisement in it.

Damaged corn is exceedingly injurious because it brings on inflammation of the bowels and skin diseases. Chaff is better for old horses than hay, because they can chew and digest it better.

When a horse is worked hard its food should be chiefly oats; if not worked hard its food should chiefly be hay, because oats supply more nourishment and flesh-making material than any other kind of food, hay not so much.

Rack feeding is wasteful. The better plan is to feed with chopped hay, from a manger, because the food is not then thrown out, and is more easily chewed and digested.

Sprinkle the hay with water that has salt dissolved in it, because it is pleasing to the animal's taste and more easily digested. A teaspoonful of salt in a bucket of water is sufficient.

The following horse talk is, at least, rational and worthy of consideration: Suppose you were in the harness, and I were in the wagon; I had the whip and you the traces, what an ardent advocate you would be for kindness to the irrational creation? Do not let the blacksmith drive the nail into the quick when he shoes me, or burn my fetlocks with a hot file. Do not mistake the "dead-eye" that nature put on my foreleg for a wart to be exterminated. Do not cut off my tail short in fly time. Keep the north wind out of our stables. Care for us at some other time than during the epizootics so that we may see your kindness is not selfish. My dear friends, our interests are mutual. I am a silent partner in your business. Under my sound hoof is the diamond of national prosperity. Beyond my nostrils the world's progress may not go. With thrift and wealth and comfort I daily race neck and neck. Be kind to me, if you want me to be useful to you.

Reminded Her of Her Mother.

The beggar who asked alms of a philosopher on the plea that he was his brother, "counting back to Adam," and received a penny and the kind wish that all the rest of his "brothers" would give him as much, presumed rather too far on his relationship. But natural fellow-feeling is a virtue that ought never to be smothered in the human breast, and often it draws the poor and the suffering very near to us, prompting beautiful benevolence and tender deeds.

A lady was riding in her carriage among the mountains, when they came upon an old woman with a funny little hood on her head and a staff in her hand, walking on all alone. She was neat and clean, and her skin soft and delicate, but her back was bent and she was farefoot. The lady saw she was shoeless and stopped the carriage.

"Here is some money," said the lady, in a tender tone.

"What for?" said the woman, looking up pleasantly.

"To buy shoes for your poor feet. Do you want a pair of shoes?"

The woman laughed a little low laugh, which seemed to come from a heart filled with simple, happy thoughts.

"Don't you want a pair of shoes?" asked the lady, a little hurt.

"I s'pose I do," said the woman; "but I didn't think of anybody's giving 'em to me."

"Take this bill, please, and buy you a pair," said the lady.

"God bless and reward you!" answered the woman, heartily.

The carriage drove on, and the lady sank back on the seat, with tears in her eyes.

"Oh," said she, "I thought I saw my own mother in that dear old lady. She had just such a sweet face and pleasant voice. You don't know how I felt when I thought of my mother, old and feeble, walking with bare feet over the rough, rocky road."

If we all saw fathers and mothers, sisters and brothers, in the poor and the hungry, what a world this would soon be! —*Exchange.*

"I thought you were born on the first of April," said a husband to his lovely wife, who had mentioned the 21st as her birthday. "Most people would think so from the choice I made of a husband," she replied.

Apiary.

The Slaughter of the Bees.

Ah, see where robb'd, and murdered, in that pit
Lies the still heaving hivel at evening snatch'd,
Beneath the cloud of guilt-concealing night,
And fix'd o'er sulphur: while, not dreaming ill,
The happy people to their waxen cells,
Sat tending public cares, and planning schemes
Of temperance, for winter poor; rejoiced
To mark, full flowing round, their copious stores.
Sudden the dark oppressive steam ascends;
And, used to milder scents, the tender race,
By thousands, tumble from their honey'd domes,
Convolv'd, and agonizing in the dust.
Ah! was it then for this you roam'd the spring,
Intent from flower to flower? for this you toil'd
Ceaseless the burning summer-heats away?
For this in autumn search'd the blooming waste,
Nor lost one sunny gleam, for this sad fate?
O man! tyrannic lord! how long, how long,
Shall prostrate Nature groan beneath your rage,
Awaiting renovation? Or their ambrosial food
Can you not borrow; and, in just return,
Afford them shelter from the wintry winds?

Bee Farming in Los Angeles County.

Among the manifold products exported from this county, that of honey promises at no distant day to assume an important position. During late years several parties have entered into the business of bee farming systematically, using the valley lands principally for that purpose. The honey that has been raised in the valleys, has not, however, been altogether free from blemish, and could not compete successfully in the San Francisco and home markets with Eastern-made honey, being of a dark, yellowish color and of a somewhat sickly taste.

During the last year or so bee-keepers have had their attention turned toward the mountain lands, previously considered worthless, and along the foot hills of the San Bernardino range apiaries are now scattered hither and thither. Like the land of Canaan, the foot hills and mountains in this country flow with honey, swarms of wild bees hiving in the crevices of the rocks and in the rotten trunks of trees. There are not a few men actually engaged in noting else than hunting swarms of bees and robbing their hives with considerable profit to themselves.

The sloping lands of the foot hills have as a rule, little vegetation other than greese-wood and wild sage; but these bloom so profusely as to afford the best kind of bee pasturage. A league of such land, with a small stream of water the size of one's finger for the use of the bees to make their wax, is considered ample for a bee farm of at least five hundred swarms. Almost every ravine on the mountain sides contains such a stream of water.

The first consideration with the bee farmer after securing a location is to commence the stocking of his farm. During winter, it is an easy matter to obtain swarms for about $2 each, and with twenty hives to commence, the bee-keeper considers himself fortunate, always providing, of course, that he understands the business. With careful management, these swarms will multiply to three or four times that number during the season, besides yielding some where in the neighborhood of two hundred pounds of honey per hive. It is usual, however, for bee keepers to increase their stock with swarms of wild bees, whenever occasion permits them to hunt.

To the inexperienced, hunting for a wild bee's hive, must appear a hopeless undertaking; but the bee hunter views it as being exceedingly simple. It is done somewhat after the following fashion: proceeding out of the range of the pasturage of his own bees, he places a piece of burning wax on the ground, and adjacent to it he deposits a little honey. If there are any bees in the vicinity the burning wax attracts them to the spot, and they soon alight upon the honey. The hunter watches the bee until it obtains its fill, when it at once takes flight for its hive. Sometimes he waits the return of the bee, which never fails to do so, accompanied by several of its confederates. Some of these the hunter captures and places in a box. He then proceeds in the direction of the first bee. Having gone far enough according to his judgment, he liberates one of the bees held captive, which flies onward in case the hive is not already passed; if otherwise, the bee returns and the hunter has to retrace his steps. Whenever he deems it necessary, the process of wax-burning is repeated. By these means it seldom takes many hours for the hunter to find the cave, rob it of comb, honey and swarm and carry all triumphantly to his own apiary.

The bee hunter has three enemies, with whom he is constantly at war—the moth, the bee-bird and the lizard. The moth works its way into the hive, and if permitted to remain will soon destroy the strongest swarm. The bee-bird bears a striking resemblance to the common camp-jay or butcher-bird, and feeds altogether upon bees, as the craw of every bird killed is found to be filled with their carcasses. Bees are also a dainty titbit for lizards. These reptiles are exceedingly numerous everywhere throughout the dry foot hills, and wherever a bee alights for the purpose of collecting honey, if discovered, she is at once snapped up by one of these voracious little reptiles.

All pieces of comb of any size are taken out and placed in a revolving machine, which, in its revolutions, throws the honey from the cells. When the honey is extracted from the comb, it is placed in a hive and the bees set at work immediately to refill it. The old system is to melt the honey out of the comb by the heat of the sun, the result being the discoloring of the article by the melting of the bee-bread, and the destruction of the comb. It is a saving of two or three weeks' honey-making to a bee-keeper to be able to place the old comb back in the hive, as it would take all of that time for the swarm to make new combs.

Honey from the mountain apiaries is much paler than that collected by bees working in the valleys, and is entirely free from the sickly taste belonging to the latter. Honey thrown from the comb by the machine before referred to is as clear as crystal, and brings the highest prices in the market; which is at present from fifteen to twenty cents per pound.—*Bee-Keepers' Magazine.*

About Bees; for Children.—Have you ever, children, watched the bees in their hive? Their hive is their little city, and each little citizen works hard to build up the wonderful comb in which they store their winter's supply. There are no harder working, busier little creatures in the world than these little insects. They seem also to have a wonderful amount of wisdom and knowledge in their little heads. A lady in Providence relates in the *Little Corporal* a very interesting story about bees, which shows their wonderful power of instinct.

Her father, she tells us, once brought home a molasses hogshead, to be used as a water tank. On washing day, her mother said, "Let us throw the suds into it, to soak the molasses from the bottom." The instant she had done she exclaimed, "O, I have drowned hundreds of our neighbors' bees."

The hogshead was black with bees, that were busily appropriating the sweets from what they must have considered an enormous blossom. The good lady made haste with her skimmer to skim the bees from the top of the water, and spread them on a board in the sunshine; but they seemed drowned and nearly dead, and she was very sorry.

All the bees that were around the hogshead had flown away at the dash of the water, but in a few minutes they returned, accompanied by scores of others. Then began a curious work. They immediately went to work upon the unfortunate bees, turning them over and over and working upon them constantly with their heads, feet and atenuæ. The result of their busy labors was, that one after another gave signs of life, stretched its limbs and wings, crawled about and dried itself in the sun, and flew away. The lady said there were half a pint, at first, and that there remained only about a dozen hopeless cases, beyond the humane efforts of their brothers.

Facts and Fancies.—Never feed bees cane sugar syrup, for as its water dries from it, it crystalizes. The sugar should have added to it three drops of sulphuric acid which, upon being boiled changes the cane sugar into grape sugar (the form in which sugar occurs in honey), which will not crystallize, and which is more natural as food and better for storing than cane sugar. Grape sugar can be purchased at eight cents per pound and comes in solid cakes in boxes containing about one hundred pounds.

The demand for beeswax is always equal to the supply. Circumstances, which to the casual observer would seem upimportant, affect its price; for instance, if gold is high, wax is high, and the low price of gold has a corresponding effect upon wax. In case the Pope dies, the ceremonies in every Catholic church throughout christendom would be of the most elaborate character and long continued. In this ceremony the consumption of wax candles would be so great and immediate that commercial operators estimate the advance would be at least 20 or 25 cents per pound. Last year, our readers will remember, he was not expected to live, and wax advanced to 40 and 41 cents.—*Bee-Keepers' Magazine.*

A Ventilation Joke.—They have a good joke on a "professor of ventilation" down East, who being put into a room at a hotel with another guest, asked the latter to raise a window at night, as the air was so close. "I can't raise it," said the guest, after working at the window a while. "Then knock a pane of glass out," said the professor, which was done. After a while the professor got up and knocked out another pane, then he was able to sleep; but in the morning he discovered that he had only broken into a book-case!

The French have a tool called a thistle-puller, made of wood, and looking very much like a pair of blacksmith's tongs. Five or six old women, armed with this instrument, can clear an acre of ground of its thistles in an incredibly short space of time, and with little more bending of the body than a house maid displays while sweeping a carpet.

Hygienic.

Tired Nature's Sweet Restorer.

SLEEP is a positive necessity. It is a period of recuperation, during which there is a restoration of what has suffered collapse, waste, or disturbance durlng the period of waking activity. The tired brain and aching muscles regain by rest strength and power to obey the mandates of the will. The demands of the material form for rest are so great as to often defy the actlsn of the mind. During the cholera summer of 1849, while practicing in the country, so constant and fatiguing were my professional labors that I have often ridden for miles on horseback sound asleep. Almost every physician in active practice during periods of epidemics, when his strength was taxed to the utmost, has dropped into asleep, as I have done many times while walking the streets. During the battle of the Nile many of the boys engaged in handling ammunition fell asleep, even while the roar of the battle was going on around them. It is said in the retreat to Corunna whole battalions of infantry slept while in rapid march. Even the most acute bodily sufferings are not always sufficient to prevent sleep. The worn-out frame of the victim of the Inquisition has yielded to its influences in the pause of his tortures upon the rack, and for moment he has forgotten his sufferings. The Indian burned at the stake, in the interval between the preliminary torture and the lighting of the fire, has sweetly slumbered, and been only aroused by the flame which was to consume him curling around him.—*Ex.*

Location of Houses.—The *Science of Health* has some sensible suggestions on this topic, which are appropriate here:

Houses should be built on upland ground, with exposure to sunlight on every side. During epidemics, it has been noted by physicians that death occurs more frequently on the shaded side of the street than on the sunny side; and in hospitals physicians have testified to the readiness with which diseases have yielded to treatment in sunny rooms, while in shaded rooms they have proved intractable.

Let there be no bogs, no marshes, no stagnant water in the neighborhood. Then let the cellar be thoroughly drained. Inattention to this subject has caused the death of many a person. No father or mother should rest a moment in peace while their innocent babes are sleeping in rooms over damp and mouldy cellars. Cellars should not only be drained but thoroughly ventilated, otherwise the house must be unwholesome.

Let the drains also be constructed for the conduction of slops and sewage of all kinds to a common reservoir, at a distance from the dwelling, to be used for fertilizing purppses.

Door-yards should be kept clean and dry, composed largely of green swards, on which children may romp and play. This should be their play ground, rather than the carpeted room. They are entitled to it, that the breath of nature and of nature's God, as it flitters through the blue sky, may fan their rosy cheeks, and fill their souls with joy and their bodies with health.

Eating.—As so much of a man's happiness and usefulness in life depends upon eating correctly, and as the housekeeper has so much control over this part of our living, we have thought that a few suggestions on the science and art of eating might be appropriate to this department.

Every emotion of the heart, every operation of the mind, every motion of the body, or of any member or organ thereof, consumes power which must be supplied by the food we eat; and while it is of the utmost importance that our food shall be wholesome, nutritious and digestible, it is of scarcely less importance that it be eaten correctly, at the right time, and with our systems in the right condition.

As first in order we would say, never eat when the body is exhausted. Under judicious management, farmers and their wives need never have dyspepsia, for their plain fresh diet and free exercise should prevent that terrible disease; but statistics we think will prove that they are no more exempt from it than other classes. That they are not, we think, is attributable to the fact that they too often eat when they ought to rest; when their powers are too much exhausted to perform the functions of digestion.

The housewife does her own work, or at least assists about it, works hard to hurry up dinner and have it ready on time, calls the men before dinner is ready, hurrying to the last moment, and then, when she ought to lie down and rest, she sits down to the table and eats. She is so much exhausted that hunger has ceased, her organs of taste are inactive, her salivary glands do not perfectly perform their functions, she does not masticate well, and the food enters a stomach not prepared to perform the work of digestion.

The farmer hurries from the field and his severe labor, and while yet weary and exhausted, sits down and swallows his food, hurrying back to his labor. Is it surprising that, after a few years, the digestive organs become impaired and so many farmers and farmers' wives have wrecked their health before arriving at middle age?—*Rural Home.*

Fresh Air and Pure Water.—Each year typhus and typhoid fevers carry off thousands of victims, whose lives are thus forfeited to their ignorance or neglect of well-ascertained laws. An abundant supply of fresh air and pure water is necessary for the healthful life of both men and animals, and when they are deprived of these requisites, disease and death ensue.

In our last issue an eminent physician presented a statement of the principal causes which produce the typhus class of fevers, and this week he instances cases in which a father and two daughters died from the effects of drinking brook-water which was impregnated with excrementitious matter. It would not be difficult to enumerate a large number of other cases in which death has occurred from similar causes; but enough has been said to answer the purpose of warning our readers against the danger of carelessness with regard to what they breathe and drink. Let us then be advised, and supply our lungs with pure air and our stomachs with wholesome food.—*Hearth and Howe.*

Healthfulness of Lemons.—When the people feel the need of an acid, if they would let vinegar alone and use lemons or sour apples, they would feel just as well satisfied and receive no injury. And a suggestion may not come amiss as a good plan when lemons are cheap in the market. A person should in those times purchase several dozen at once and prepare them for use in the warm, weak days of spring and summer, when acids, especially citric and malic, or the acids of lemons and ripe fruit, are so grateful and useful. Press your hand on the lemon and roll it back and forth briskly on the table to make it squeeze more easily, then press the juice into a bowl or tumbler—never use a tin—strain out all the seeds, as they give a bad taste. Remove all the pulp from the peels and boil in water, a pint for a dozen pulps, to extract the acid. A few minutes' boiling is enough; then strain the water with the juice of the lemons; put a pound of white sugar to a pint of the juice; boil ten minutes; bottle it, and your lemonage is ready. Put in a teaspoonful or two of this lemon syrup into a glass of water, and you have a cooling and healthful drink.

Remedies for Coughs.—The London *Lancet* says: "Anodynes, narcotics, cough mixtures and lozenges are practically of no good, and but too often increase the debility and hasten the fatal end. The best method of easing a cough is to resist it with all the force of will possible until the accumulation of phlegm becomes greater; then there is something to cough against, and it comes up very much easier and with half the coughing. A great deal of hacking and hemming and coughing in invalids is nervous, purely nervous, or from the force of habit, as shown by the frequency when thinkiug about it, and the comparative rarity when the person is so much engaged that there is no time to think about it, and the attention is compelled in another direction."

To these sensible remarks from high authority, every thoughtful observer will be ready to grant a considerable degree of credence. That coughing is in itself injurious, and promotive of inflammation and irritation, is universally admitted. That it is largely under the control of the will no one can doubt who has observed the phenomena of coughing in large audiences. We have heard one cougher start another, until the whole congregation seemed to be in the irresistible grasp of asthma or consumption; and we have known the same congregation, at some particularly interesting moment of a lecture or music or sermon or spectacle, all intent to see and hear, preserve an unbroken stillness. Evidently the way to stop coughing is to stop it!

Editing needs patience, for there are a great many things constantly occurring in the newspaper business which have a direct tendency to make a man fractious and ill at ease unless he has a large stock of patience to fall back upon, whereby he can bear up under his burden. A pious editor out west says: "A man needs grace to edit a paper properly at any time, but especially when he has the rheumatism."

Here is what "Brick" Pomeroy says about the qualifications of an editor:

No man should ever attempt to be an editor and publisher unless he has the pluck of a bull-dog, the tenacity of death, the ugliness of a devil, the mellowness of a child, the independence of most perfect manhood, the fullest faith in his ability to endure and a willingness to wait for years, to the very verge of the grove, and even till the opening of eternity for his reward.

"Brick" is sound on the goose.

Educational.

What is a Good Education?

"TEACH a boy that which he will practice when he becomes a man" is advice which has come down to us form the ancients. Although there is no knowledge which is useless, it is better to be systematic in its attainment; and the kind of knowledge we get should depend largely upon the profession or business we intend to follow. Still a man should not study simply one thing, for this would soon lead to unprofitable narrowness; but should so far as possible, consider all things relating to his pursuit.

Boys should commence to study themselves early; this is especially true of farm boys, for they have thrown around them fewer opportunities to draw out their powers in the direction of the greatest efficiency. Washington has said that "agriculture is the most healthful, the most useful, and the most noble employment of men." Some have the impression that if a man cannot be anything else, he can be a farmer. This is a false notion, for it takes as much ability to become a master farmer as it does to excel in anything else. Agriculture is a science and an art; no one, without special aptitude, need expect either to master or apply its principles as they should be understood and applied.

But what shall be done with those boys who live on farms, but who have a strong inclination for something other than the business of their fathers? Shall they be held to the farm to take a low position among the others of their business, or shall they be permitted to go out into the world in the direction which the promptings of peculiar powers demand, to stand perhaps in the front rank of some other profession?

This is not merely a question of gratification to the individual, but it is one of usefulness to the world at large. Every man is noble when he fills to the best of his ability the post to which nature calls him. Boys who have reached the age of fifteen, generally know something of their tastes and inclination, and their education should have some reference to them. It is for every man to get as good an education as he can; but all have not the same opportunities. All should know how to read and write, and use promptly and accurately the first principles of arithmetic. Good spelling is a useful accomplishment. Honesty is necessary, and should be taught and learned everywhere, whether at home, in the schools, or in the world. Energy and perseverence should be taught while honesty is acquired. Punctuality must be learned in school, as it is one of the chief qualifications of a business man. Then finally a young man should acquire the technicalities and peculiar qualifications needed in his business. Though a man may have received a classical education, a knowledge of business is something which would be quite useful and very often necessary to him if he would be saved from many of the inconveniences brought about by ignorance of the ways of the world. All should know considerable of accounts, for a business habit is a great economizer. Every business man should write a plain, rapid business hand, and have a thorough knowledge of accounts, theoretical and practical. A business college can give the information and practice in these directions, so far as it is possible to give them without actual contact with the business world better than any other school, on account of its greater facilities and the attention given to these particular departments.—*La Crosse Review.*

REASON AND IMPULSE.—All persons having charge of children will be interested in the following observations on this subject by Rev. H. N. Hudson:

Principle and impulse are often spoken of as opposed to each other. And, as men are, such is indeed too often the case; but in ingennous natures, and in well ordered societies the two grow forth together, each serving to unfold and deepen the other; so that we have principle warmed into impulse, and impulse fixed into principle. This gives us what may be described as a character informed with noble passions. And say what we will, bad passions will have the mastery of a man unless there be good ones to countervail them. For Reason, do the best she can, is not enough; men must love; and their proper safeguard is in having their love married to truth and virtue. When such is the case the state of a man is at peace and unity; otherwise, he is a house divided against itself, where principle and impulse strive each for the supremacy, and rule by turns; headlong and sensual in his passions, cunning and selfish in his reasons.

BE FAITHFUL.—A man cannot afford to be faithful under any circumstances; a man cannot afford to be mean at any time; a man cannot afford to do less than his best at all times and under all circumstances. No matter how wrongfully you are placed, and no matter how unjustly you are treated, you cannot for your own sake, afford to use anything but your better self, nor to render anything but your better services; you cannot afford to cheat a cheater; you cannot lie to a liar; you cannot afford to be mean to a mean man; you cannot afford to do other than deal uprightly with any man, no matter what exigencies may exist between him and you. No man can afford to be anything but a true man, living in his higher nature and acting from the highest considerations.

THE sure foundations of the State are laid in knowledge, not in ignorance; and every sneer at education, at culture, at book learning, which is the recorded wisdom of the experience of mankind, is the demagogue's sneer at intelligent liberty, inviting national degeneracy and ruin.—*G. W. Curtis.*

WE cannot be too much impressed with the importance of literary culture. We should not despise nor think lightly of the moral, imaginative or poetical elements of our being. The poetical element has more to do with our happiness than any of the coarser kinds of knowledge called facts.

Learn thoroughly what you learn, be it ever so little, and you may speak of it with confidence. A few clearly defined facts and ideas are worth a whole library of uncertain knowledge.

"Time softens all things," except the young man who parts his hair in the middle and whistles in the street cars. Nothing can make him softer than he is.

Correspondence.

Soliloquy of a School Teacher.

BY ELISA E. ANTHONY.

TALK about peace in a school room! I've been endeavoring to find it for the past month, and I have not even found an infinitessimal atom of it—suppose it was lost before I arrived.

I only wish that those people who call children "sweet cherubs" and "little angels" could experience what I have. They would change their opinion after seeing the "sweet cherub" throw himself on the floor and roll, shrieking with passion, because he could not have "his own sweet will."

My patience is almost exhausted. If a scholar transgresses the rules, and I punish him for so doing, the following day an irate parent will visit me, and say that her precious boy is very delicate and must not be thwarted; and if I venture to explain, she will raise her vinaigrette to her aristocratic nose and sweep proudly away, while her "precious boy" behaves, if possible, worse than ever.

Sometimes I fall into a day dream, when the pupils are quiet, and I am roused by "Pierse, ma'am, Bill Brown is pinching me black and blue,"—"I aint, either,"—"You are,"—"Please'm Molly Hicks threw an apple at me,"—"Can I go out?"—"Say, teacher, isn't six times six forty-two?"—"Oh! teacher, Sally Marsh is throwing notes to the boys,"—"You're a little tell-tale; I ain't doing no such thing,"—and so on, until I am almost crazed with the noise.

I recover my dignity, which I had almost lost, and restore order for about five minutes.

In a short time I hear a loud whisper, "S-a-y, Clementiny Snipkin, I heard my ma say that Mrs. Firy told her that she heard from her brother-in-law that he saw teacher walking with a man; just think of it—a *man!*" and there is a titter, which I quickly suppress, and am—oh, so glad when school is out and I am free. To think that I cannot walk with my cousin without people making remarks. My every action is criticised. If I speak, every word I utter is watched, to see if I speak contrary to the rules of grammar.

If I read a novel, their hands are uplifted in holy horror at such waste of time; and the first opportunity they have they borrow that condemned novel.

If I speak to a man under sixty years of age they say I am a flirt; if I remain quiet I am called haughty.

If I dance they are shocked and say I am frivolous; and if I decline to dance they kindly say that I am above my place.

If I dress plainly I am styled a miser, and my friends (?) wonder what I do with all my money; and if I dress a trifle better I am wasteful and extravagant.

It is very difficult to please everyone, and the best thing I can do is to get married and please one person, so remember me when you see an eligible young man.

FLUME MILL, August, 1875.

GRATITUDE.—A bachelor made a will, leaving his property to the girls who had refused him, saying, "to them I owe all my earthly happiness."

Women.

Something About Woman's Sphere and Work.

BY NELL VAN.

SAYS T. W. Higginson, in the *Woman's Journal:* "If woman is merely a duplicate man, she is a very inferior man. If he is the standard of human perfection, she is so far beneath that standard as to be hardly worth considering. But, on the other hand, if he be tried by her standard he is equally far removed. Thus we discover that each is one-half of the whole; we must set his greater physical strength against her greater pliability and endurance—his slow logic against her swift intuitions, before we can do justice to either. And when we once do this, the inevitable outcome is—woman suffrage.

"The same principle applies to co-education. If by adding twenty-five girls to a school of twenty-five boys, or the converse, you merely filled an additional number of seats, it would be a matter of little importance. But the teacher finds, when the change is made, that his school is not merely enlarged in size, as if an added number of the same sex had been enrolled. With the other sex a new element has come in, which gives new life and interest to the school; an element of mutual excitement, pleasure, courtesy, pride. 'I never yet saw a school,' said to me a teacher of great experience, 'that I could not rule by the waving of my finger, if I could only have boys and girls together.'

"The same rule applies to occupations. In the introduction of women into a variety of employments the assumption is often made that you are, after all, only increasing an inferior class of men. But the *Woman's Journal* has again and again pointed out that the general introduction of machinery is the introduction of woman into all industry. Every step in machinery exchanges brute strength for delicate manipulation. Woman finds daily more and more work, of a kind which she can not only do as well as man but better than man, by reason of quicker wits and nimbler fingers. This process bids fair to go on, we hold, till the sexes compete fairly in the business market."

When such good words come to us from one who has long been a keen observer of the capabilities of our sex, should we not, as a body, strive to deserve the exalted opinion so publicly expressed, and each do what we can to elevate the down-trodden and encourage them in becoming the thoroughly practical beings it has been proved we are capacitated for? Encouragement is what we need. Give us the right hand of fellowship, good men, help us to obtain honorable employment, and let us enter the ranks of the world's workers if our tastes so incline, without calling us disagreeable names to remind us of the accident of sex, which we have been told by wise physicians must debar us from attempting any but the prescribed employments belonging to *woman's sphere.* Many capable women hide their talents, or prevent their full development, from fear of the censure of an unsympathizing world. Sometimes the possession of wealth and position interfere with their growth; but the hand of adversity comes only too soon. Sadly the poor victim finds herself wanting in time, opportunity, strength and money, which prevents her from pursuing the most congenial pursuit of her life, and the consequence is, the world is robbed of an efficient artisan, and the ranks of the sewing woman are swelled with perhaps but another indifferent worker. Come to the rescue of all womankind; teach young persons that they are never fulfilling their destiny till fairly launched into some industrial pursuit, congenial if possible, then this world will possess ten-fold more attractions above those ordinarily enjoyed, and the cause of humanity will be advanced by living specimens of practical industry. A foretaste of usefulness will be obtained which cannot be taken away, and life will be so much the richer to those fortunate ones. The world moves on. Never despair while so many good persons have the welfare of humanity at heart.

A Lady's Opinion Upon Political Questions.

POLITICS AND TEMPERANCE.

How strange it is that some dislike some mixtures and like others. If there is alcohol in the mixture, all's well, but not otherwise. This is the reason why many are content that

INTEMPERANCE AND POLITICS

should be mixed together, as they always have been. The stomach is the great ballot-box of the nation. A mixture containing alcohol is the most powerful argument which politicians can wield to gain the favor of the "dear people." Rum formerly controlled our elections, and it still influences them more than most people imagine. A few years ago it came out openly, and a sharp eye might have seen at every election ground the beautiful Goddess of Liberty sitting astride a whisky cask, with a jug on the end of her poll. Intemperance and politics were inseparable.

DISSOLUTION OF THE UNION.

"Union is strength," they say, but it depends on the kind of union. The union of rum and State is the destruction of strength. It is the people's interest to get rid of this union as soon as possible. Now, we must either carry temperance to the polls, or carry rum there. Which do you prefer? If a man comes to you to work in your orange grove, or to plow or dig, or to take care of your horses, you want to know if he is a sober man before you employ him. But is his employment isto make laws, or to administer them, or to guard your property, a drunken man will do just as well, provided he belongs to the right political party and has a good chance of being elected. If a temperance man refuses to vote for the drunken candidate, the air rings with the cry of "proscription," and "mingling temperance with politics." There is more need of temperance at the polls now than almost anywhere else. It would be a curious sight to have a legislature of sober men, and we want to see it as soon as possible.

REPUDIATION.

Let us repudiate all office-holders that are adicted to strong drink, and all drunkard-makers also.

VETO.

Let us veto dram drinking in every form, and we shall have a free and happy people. In exercising the veto power, we are treading on no doubtful ground; we exercise no doubtful privilege. We have a constitutional right to do so, and no one will dispute it.

I am also in favor of a

NATIONAL BANK,

and I will give my plan of it. Several hundmillions of dollars are wasted every year in these United States to purchase alcohol and to remedy its consequences. Let it be laid aside as a capital for a national bank.

INTERNAL IMPROVEMENTS

I go in for to their full extent. A number who were old topers a few years ago, and who have signed the Declaration of Independence know by experience what "internal improvement" means.

PRESERVE THE CONSTITUTION

by repudiating alcohol, the greatest enemy of the human constitution. It is impossible for a free government to exist where it is used. No man who drinks is free. He may talk of liberty, but he does not know what it is. Throw off the shackles of appetite and enjoy liberty.

I want you all to mingle temperance with politics, so far as to produce an effectual dissolution of the union between intemperance and politics. Carry temperance to the polls, so as to apply the doctrine of repudiation to rum-drinking public agents. Save your money, and in this way get rid of National and State debts. I want every man, woman and child to practice internal improvements and preserve the constitution inviolate from the influence of rum.

A New College for Women.

Our correspondent, "Nell Van," who was acquainted with the family, and who has taken so much interest in educational movements, would call attention to the establishment of the new college for women, which promises to become a grand institution for the advancement of the sex in many of the qualifications for a useful life.

The Northampton, Mass., *Journal and Free Press* of July 17th gives an interesting account of the inauguration of Smith's College, of Northampton, an institution founded expressly for giving women a complete college education. We briefly extract from its columns:

Wednesday last was a bright day for the cause of higher education in Massachusetts, and, indeed, in the world. It was the occasion of the dedication of Smith College, at Northampton. The fact is an index to the progress of the movement which brings

WOMAN TO THE FRONT,

in the equality of privileges, and gives education its place as the foundation for the security of rights. These features form the basis of the institution. Says the instrument which is the constitution of the college: "By the higher and more Christian education of women, what are called their "wrongs" will be redressed, their wages adjusted, their weight of influence in reforming the evils of society will be greatly increased; as teachers, as writers, as mothers, as members of society their power for good will be incalculably enlarged." And again, the object is stated to be "The establishment and maintenance of an institution for the higher education of young women, with the design to furnish them means and facilities for education equal to those which are afforded now in our colleges to young men."

THE FOUNDER OF THE INSTITUTION

was a woman of the true New England type, Miss Sophia Smith, of Hatfield, Mass. The family was among the earliest of the settlers of that beautiful Connecticut Valley town, and though it has now become extinct, it has left a vitalizing force in the community that will

perpetuate its name and honor. It was a wonderfully marked family in this respect. The uncle of Sophia Smith was the founder of the Smith's Charities, which, with a large fund, extends a helping hand to the indigent and worthy boys and girls, young women and widows of the vicinity. From him also is a fund, at present accumulating, for the establishment and working of an agricultural college at Northampton.

The Smiths were industrious and frugal farmers, with strong, upright characters, who by small gains and prudent investments, accumulated the fortune which was the nucleus of their charities. Oliver Smith, who established the Smith's Charities, started when twenty-one years old with a patrimony of $500. At his death his estate inventoried $370,000. Sophia Smith acquired the bulk of her estate from her brother, Austin Smith. At his death in 1861, she had in her own right about $30,000, and received from him the sum of $200,000. This property she immediately placed in the hands of the late Hon. Osmyn Baker, who was the active manager of the Smith's Charity fund, and at her death in 1871 it had accumulated to the sum of $468,843, while in the meantime she had given to Andover Seminary $30,000, and made other charitable gifts.

THE BEQUEST.

The larger part of this sum was left by the will of Miss Smith for the establishment of this college. $75,000 was given for the building of Hatfield Academy in her native town. Some $91,000 were given away in various ways, in her will, including the Hatfield Academy fund, and adding to this expense of probate, it left for the chief bequest, in round numbers, the sum of $350,000. And to this was added $25,000, which the will required should be given by the town of Northampton. This fund has been invested and accumulating since her death, so that at the present time it inventories at par value a little more than that amount, beside what has already been expended for building. By the will no more than one-half of the bequest can be appropriated to buildings and grounds, the other half or more to be invested as a permanent fund, the interest of which, alone, shall be used forever for furnishing teachers, library and apparatus, and for general purposes of the institution.

THE BUILDINGS

of the college are pleasantly located on an eminence near the center of Northampton, commanding a view of the town, and the valley and mountains beyond. They seem naturally at home in a town around which are grouped so many important educational institutions, and which has itself long been a center of educational, social and intellectual advantages.

The College is now fairly started on its career. There are none but wish it the success which it is the high aim of its officers to achieve. "I would have it," said the founder, "a perennial blessing to the country and the world." That it will be such we feel certain.

A Response from "Jewell."

Eds. Agriculturist: I was very much amused at your correspondence signed "Sara Toga," in which "Jewell" was handled without gloves because she was honest enough to admit that she did not know *everything* and her husband *did* (to her). Before coming to the first period I had discovered "Sara Toga's" sex. No woman ever flaunts her social and moral superiority in the face and eyes of husbands and brothers so recklessly. Nor is a woman to be disenfranchised in her own eyes because she does not know how to make good bread—a man would perhaps believe her incapable of voting for such a reason—while it would be in order to marry one who did not have that knowledge. "Sara" could perhaps be able to prove to your readers that he knew everything, and therefore was qualified to vote. How I wish the same test were applied to the men! Thanks to "Sara" for the receipt for making yeast and bread, but if he will drop into our little "shady shanty" some day this embryo farmer's "Jewell" will give him a taste of her bread, and see is his wife can beat it—for I'll be bound he don't always make his own bread.

PROPER WHEAT.

The History and Valuable Qualities of this Cereal.

Last month we made mention of this wheat as having yielded one-third more to the acre on Mr. A. Woodham's farm than the beardless wheat. The following letter, written by A. D. Starr, of the Starr Mills of South Vallejo, gives a correct history of the Proper wheat, and sets forth its valuable qualities as a variety for cultivation in this State. It also gives its relative value for flour making:

Editors Sonoma Democrat—Sirs: Your letter of inquiry relative to Proper wheat is at hand. I now give you in brief such information as I possess. This wheat was first grown in this State on the farm of Mr. Proper, in Sutter county, which accounts for the name "Proper," no other being positively known for it. It was found growing in one bunch, or stool, from one kernel, if I am correctly informed, in a field sown with imported Chili seed barley which I furnished. This first handful of heads of wheat was shown to me. I liked its appearance and advised its being propagated with care, with the request that as soon as enough could be spared in the future I wanted it to make a test of its good qualities for flour by grinding. In due time I got the wheat, made the test, and found it superior to any wheat I had ever ground. The wheat is particularly well adapted to short seasons, in dry, hot climates; it being a bearded wheat the hot, dry winds and sun do not blight or burn the upper end of the head, as often happens with bald wheat; the beards protect it. For early sowing on rich loam or summer fallow land I do not so particularly advise it, being informed that it does not give so large a yield as some other varieties. It seems to be particularly adapted to late sowing, giving a large yield of very superior grain, which makes also a large yield of superior flour, giving but a small quantity of offal. We have been able to purchase enough of it so as to keep it constantly on hand for daily mixing in wheat we grind, more or less, for the past two years. Sutter, Yuba, Colusa, Butte and Solano counties must have raised some 20,000 tons the past season. It value is certainly worth fifty cents per ton more than any other wheat for milling, of the same cleanliness, etc.—yes, or shipping either. I have seen a good crop raised of Proper wheat, sown late in March, upon which no rain fell after sowing, yet it matured some ten to fifteen days sooner (and was ready for harvesting) than other earlier sown wheat.

Yours, truly, A. D. Starr.

Little strokes fell great oaks.

Stick to the Farm.

Within the last year or two, we can number a half dozen of our farmer acquaintance who have been lured to financial destruction by the glamour of speculation. And going back ten years, and carefully looking up the history of the men we know, who have left the farm to engage in trade, we find that not one in ten has succeeded. A recent case has come to our knowledge that is full of instruction to those who are tempted to leave the farm. By his own exertions alone this farmer had accumulated a handsome competence, and at the age of fifty could look with pride over his broad acres of rich land, his fine herds and flocks, and comfortable buildings. He was out of debt, and had a handsome surplus in the bank. Two years ago, in evil hour, he was induced to invest in a dry goods store. Last fall his farm and stock were sold for debt, and he is reduced to the necessity of day labor to support his large and yet dependent family. All the accumulations of over thirty years of hard toil—many of them years of privation, hardships and the closest economy—were swept away in a few months by this demon, speculation. And this is not a solitary case. Every reader can count similar ones in his own list of acquaintances. They all teach one great lesson—stick to your legitimate business, the business in which you have succeeded. "Let well enough alone." A man who has lived all his life on a farm stands but little chance to compete successfully with the men who have been educated and trained for speculative pursuits. The two occupations are extremes—honest toil at one end, and the tricks of trade at the other. If you have a good farm, keep it, improve it, adorn it, be proud of it, and when you are done with it, hand it down to your children; the best inheritance, with a good name and education, that you could leave them.—*Ohio Farmer.*

The Kind She Did Not Want.

As one of our census takers was gathering the census particulars at a house in this town a girl who had listened with much attention and apparent curiosity to the questions, finally asked:

"Why do you wish to know the age of every one, and whether they are married or not?"

The head of the family replied: "This man provides all unmarried persons with husbands and wives."

This answer was apparently received with credulity by the girl; but she asked: "How does he make out to suit each person?"

"Oh, I can tell pretty well," replied the enumerator. "You, a country girl on a farm, will not want a dandy from the village, nor a village flirt a country boy."

At this the girl dropped the subject until the enumerator left the room, when she followed him out doors and addressed him thus:

"I hardly believe what you say, but I wish to tell you one thing, if you send me a man, I don't want one that uses whisky or tobacco. I will die an old maid before I will have such a man."

She was assured that such a candidate would not be presented.—*Ellenville Press.*

It's strange but true, that the larger the income, the harder it is to live within it.

Jokes are like nuts—the drier they are the better they crack.

Grasshoppers Will Eat Peas.

Greeley, Colorado, August 18th, 1875.

Eds. California Agriculturist and Live Stock Journal: I notice a paragraph in your Journal for August that grasshoppers will not eat peas, and suggesting to your readers "that the fact that peas can be raised in a grasshopper region, is an important one." My experience is different from that of the Minnesota farmer refered to in your paper. Early this spring I had forty-five acres of wheat and fifteen acres of other crops eaten and entirely destroyed by the young hoppers, among which were an acre and a half of peas. To be sure the peas were left for the last. Finely a friend informed me, that while he was travelling in Utah several years ago, during one of those grasshopper plagues, that he saw nothing left but that was eaten, save broom corn. Encouraged by this information, I at once sent to St. Louis and procured broom corn seed for twelve acres of ground which I planted; but last week the grasshoppers came and lit and showed a particular fondness for my broom corn, in fact they eat it in preference to my white mexican field corn which was along side and appeared to like it as well as my buckwheat; they also lit and eat liberally of my remaining field peas which were not yet ripe. We have also seen them strip the cotton wood and other trees of their foliage, I am therefore of the opinion that there is nothing in the line of vegetation but what the locust will eat. Respectfully Yours,

M. J. Hogarty.

UNIVERSITY NOTES.

The New Course of Instruction in the College of Agriculture.

From the bulletin of the University of California we give publicity to the following:

The Junior Year, First Term—Descriptive Botany, with exercises in the analysis and determination of plants. Excursions will be made occasionally during the session, as the seasons may render them profitable. Economic Botany—Description of plants useful and injurious to agriculture, and their varieties.

Second Term—Agricultural operations and implements, and their application in the cultivation of the several crops. Illustrative exercises in the agricultural grounds whenever opportunity is afforded.

Senior Year, First Term—Agricultural chemistry. Nutrition of plants from atmospheric sources. Inorganic ingredients of plants, their importance and derivation. Ash analysis, Physics of plants, Mechanism of nutrition and movement of juices. Germination and development of plants and accompanying chemical changes. Second term—Chemistry and physics of soil; their origin, formation, classification. Physical properties; their determination and influence. Mechanical analysis. Chemical composition; relation to vegetable nutrition. Chemical analysis; its methods, utility and interpretation. Exhaustion of soils by irrational culture. Rotation of crops, green-manuring, fallowing, sub-soiling, through drainage, irrigation. Manures, their kinds, preparation, use and value. The rational system of culture.

Other subjects, and matters of detail, properly belonging to a course of agriculture, and special cultures, such as stock-raising, apiculture, floriculture, arboriculture, fruit-raising, etc., will, as far as practicable, be taught by special lecturers invited for the purpose. Occasional lectures on chemistry and physics of housekeeping will be delivered by Professor Hilgard.

In addition to the main library of the University, which contains some 12,000 volumes, and which is open during fixed hours to the students of all the colleges, the Agricultural College has a special and select library of several hundred volumes, which relate directly to farm life and labor. In the Museum, specimens of the botany of the State and many indigenious woods can be examined by the students, and the cases in the lecture room of the Professor of Agriculture also contain material of interest and value. The private collection of Professor Hilgard, containing some 12,000 specimens of American and foreign plants; which are arranged and classified expressly for the purposes of instruction and investigation, is deposited in the lecture room of this College for the use of the students. The University also possesses the large collection of plants, rocks, etc., of the State Geological Survey, making with the foregoing an unusually extensive series of specimens for study.

Curing Alfalfa and Corn-Fodder.

We have freqnently advised mixing dry straw with alfalfa when it is stowed away in the mow. The straw becomes softened, and the alfalfa cures without heating. The *Ohio Farmer* tells how corn-fodder is best cured in the same manner:

A farmer in Ontario county, New York, sowed oats broadcast, in the usual amount, and then drilled in corn, using three bushels of corn to one of oats. When the oats were ripe the whole crop was cut like grass, and the dry oat straw, absorbing the moisture of the stalks, rendered the whole easily cured. One of our correspondents last year, stated that he cured his fodder by placing it in the mow between alternate layers of dry straw, and that his cattle and horses devoured the straw with as much relish as the fodder. As corn-fodder is a difficult thing to cure when cut green, these suggestions should be acted upon when fodder is put in the barn.

A Fourth of July Mule.

A bad little boy in Portland lit a pack of shooting crackers and threw them into the street to see them "go off." One of Ike Bateman's mules came along and swallowed them before they "went off." The mule walked about fifteen feet and stopped. He laid his left ear around against his ribs and heard something. It was them crackers having fun. The mule picked out about three and a half miles of road and started. A negro met him about a mile the other side of the almshouse, going south, white with perspiration, with streams of smoke shooting out of his nostrils, mouth and ears, while his tail stuck straight up, and a stream of blue and green smoke about ten feet long followed in the rear. Ike found his mule yesterday morning sticking half-way through a farmhouse near Paddy's Run, still smoking. The man had got his family out and put 'em up into a lot of trees. Ike hauled his mule home, when he got cool enough, on a dray.—*Louisville Courier-Journal.*

We are Under Obligations to Robert Beck, Secretary of the State Agricultural Society, for office use, a set of bound volumes of the "Transactions California State Agricultural Society" since 1864, and our return of thanks in due form is but a slight expression of what we feel. Also, by the same, a dozen unbound volumes transactions 1874 for distribution. These books contain a deal of interesting matter and are as reliable statistically and otherwise as any such work can well be.

A Montana justice of the peace, when he marries a couple, says: "Arise, grab hands—hitched—six dollars!"

In Press.

We are in receipt of a few proof sheets of a work now in press with Bankcroft & Co., San Francisco, entitled "The Patrons of Husbandry on the Pacific Coast, by Ezra S. Carr, M. D., L. L. S."

From the sample leaves sent us, we observe that the book will contain several hundred pages of matter, also that the title is but a text to the comprehension of such subjects as Social and Political Economy, Agricultural Development in the ancient world in Europe and America. Capital and Labor, The Farmers Awaking, Industrial Education, Monopoly and Railroads, Paper Money and Protective Tariffs, etc., etc., as well as to an account of Grange Organization, all progress on this coast up to the present time. We think it will be such a work as will be in demand, and will call out much adverse criticism, as well as do much toward educating the people.

The Santa Clara Valley Agricultural Society's Annual Fair will be held during the first week in October, commencing the fourth.

California Borax.

About two years ago some outcry was made in America about the discovery of vast deposits of borax said to have been discovered in California. The glowing accounts which appeared in some of the American papers were read on this side with a certain amount of incredulity, not altogether perhaps unpardonable. However, subsequent results have proved that unlike those other "discoveries" in that locality which will be fresh in our readers' minds, the borax deposits exist otherwise than on paper, and are, in fact, remarkable in extent. Towards the latter end of 1873 some borax from the new source of supply came into the London market, and was regarded curiously, if not dubiously. The importation had little effect on the course of prices, and it is probable that the chemical trade entertained a lurking suspicion that the thing would turn out a hoax. All through last year, however, supplies came forward from the same source, and for some months past they have been on a large scale. The *bona fide* character of the discovery is thus set at rest, and the only question is as to its extent. The *Alta* says: "The great borax lake will afford a very large business. Very extensive works are now nearly completed for the refining and purifying of this borax for shipment. Millions of tons of crude borax are in sight in this immense deposit. Stimulated by the action of the railroad company the Borax Company have put up large works, and will soon be prepared to turn out from twenty to fifty tons of pure borax per day. This will add largely to the freights of the railroad. The deposit of borax is simply unlimited. It covers an area of eighteen miles in length by six to eight miles in width, covered with crude borax from 2 to 5 feet thick. The crude material will average from 20 to 40 per cent. Ten thousand men would not take out the deposit in fifty years, and it is constantly increasing." In accepting the above account it is necessary to make due allowance for national enthusiasm, but it is beyond question that California is able to boast a new and important addition to the products of her soil. The California borax has come into active com

petition with that from other sources, and while, at the beginning of 1874 the price of refined borax in the English market was £100 per ton, it can at the present time be bought for £56. The pottery districts, where large quantities of borax are consumed, are perhaps the chief gainers on this side the Atlantic by the discovery adverted to.—*Br. Journal.*

FINE FRUIT.—We were shown this week some of the finest specimens of lemons and oranges that we have ever seen in the State. They were raised by H. M. White, on Upper Tule river, in this county. The lemon measured twelve inches around one way and nine the other, and the oranges ten inches in circumference, and were fine, rich-looking. The trees are twelve years old, and yielded over 500 to the tree this year. No doubt Tulare county will become famous for its fine productions of fruit. All that is required is an effort.—*Tulare Times.*

THE FOOT AND MOUTH DISEASE AMONG ANIMALS IN DORSETSHIRE, ENGLAND.—A telegram of date London, August 24 says: The foot and mouth disease has broken out with great violence in Dorsetshire, where twelve thousand animals are down with it. The distemper is spreading rapidly.

Young wife (to George, who arrived home in the small hours of the morning)—"We are one, dear, now that we're married, are we not?" George—"certainly, my darling, why?" Young wife—"Oh, I only wanted to know; because, if we are, I must have been dreadfully inebriated last night."

HARRY, after looking on while his new little sister cried at being washed and dressed the other day, turned away, saying, "If she screamed like that in heaven, I don't wonder they sent her off."

SAID a colored Georgia preacher: "Dar's robbin' and stealin' everywhere. Dar's de Beecher business, de Woodhull business, Sumner is dead, tornadoes come whoopin' around, de Freedman's band has busted, and it 'pears as if de end was nigh, mighty clus at hand!"

ONE of the cardinal principles of the Grange is to buy nothing you don't want, and nothing you can't pay for. No man always living up to this principle ever died in the poorhouse.

THARE is advice enuff now layin' around loose to ruin just three such worlds az this. What we are suffering most for iz sum good examples.—*Josh Billings.*

"MY lecture," said a California orator, "will be brief." A turnip hit him at that instant, and he announced: "The meeting stands adjourned."

IT is said Egypt is the home of the fragrant onion. There is this about the onion—you can always tell where it is.

A LAZY school-boy, who spelled Andrew Jackson "Aru Jaxon," has been equalled by a student who marked the first of a half-dozen shirts John Johnson, and the rest "do."

☞ The California Glove Manufactory is now located opposite the Auzerais House, Santa Clara Street, San Jose. The proprietor does good honest work, on good material, and sells at prices to suit. Do not confound this with Lions establishment, but examine the work and prices and you will find everything to be as represented.

SAN JOSE INSTITUTE AND BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

I desire to call special attention to this School. Education is none the less thorough because practical. Knowledge is not superficial because its theories find illustration in the work of every day life. The mineralogy of mining, the chemistry of agriculture, and the finance of business are as likely to go to the depths of their respective subjects as when taught merely as theories with no respect to their practical application.

Gradually the Institute is raising its educational standard and improving its facilities to teach, confidently expecting that, with the increased capacity for usefulness, will come a corresponding increase of patronage.

Students desiring board will find comfortable rooms and, as we shall endeavor to make it, a pleasant home, in the Institute buildings.

ISAAC KINLEY,
Sup't. San Jose Institute.

☞ Any family within reach of San Jose should bring their pictures to be framed to Geo. S. Holmes, 438 First Street. Low rents, large purchases for cash, and the best facilities for mounting and framing, together with a disposition to suit everybody, gives him such a rush of custom that his prices are astonishingly low. Don't fail to call at his store and see for yourself.

☞ We have just received from Sherman & Hyde, music publishers of San Francisco, two beautiful songs, entitled "Is my Darling true to me?" and "Would you answer yes or no?" both composed by Chas. E. Pratt, Conductor of the De Murska Concert troupe, and dedicated to Alice Dunning Lingard and Dickie Lingard, respectively. These songs bid fair to become immensely popular, as their sale has already reached several thousand. So say the publishers, who are receiving large orders from the East. Copies will be sent by mail, post-paid, to any address by the above firm, upon receipt of the marked price (35 cents each) in currency or postage stamps.

IT is not until we have passed through the furnace that we are made to know how much dross was in our composition.

The two large tin and stove stores in San Jose, carried on by C. E. Campbell and Milton Campbell, have been combined under the proprietorship of C. E. Campbell. The fine large store under the Odd Fellows Hall now occupied by him, is probably the most complete store of the kind on this Coast. Give them a call.

The Alden Fruit Drying Factory will make a run on grapes this season. Mr. C. T. Settle, the Superintendent, says he knows that he can make superior raisins. We shall take pains to investigate the matter and report what we think about it, whether favorable or otherwise.

I. O. G. T.—GRANGER LODGE, No. 295, meets every MONDAY evening, at 8 o'clock, in their Hall, No 284 Santa Clara street, over the S. J. Savings Bank. Members of sister Lodges and sojourning members in good standing are invited to attend.

JOHN B. STEVENS, W. Sec'y.

Every Intelligent Farmer knows that neither boys nor hired men are always to be relied upon, in his absence from home, for watering stock.

Every Stock Raiser will admit that a constant supply of water keeps his stock in an easy and contented condition, and they will consequently fatten faster. By the use of the ECLIPSE SELF-GOVERNING WIND-MILLS water can be abundantly furnished at any desired place.

By making a tank 16 ft. long, 8 ft. wide and 2 ft. deep, you have a reservoir of nearly 60 barrels of water, which the ECLIPSE MILL will keep filled, for occasional calms.

We do not build the ECLIPSE for a cheap mill. We make it for *service*, and our castings alone weigh 107 lbs. more than those of other mills. Our woodwork is too well known for comment. as all acknowledge our wide, heavy fans superior to the thin, narrow slats.

Having over 3,000 mills in successful operation, a purchaser knows just what he is buying.

Should you desire a windmill for any purpose, or pumps, address *Charles P. Hoag*, 118 *Beale St. San Francisco, Cal.*, for descriptive circulars.

HOW TO PAINT,

A New Work by a **Practical Painter,** designed for the use of **Tradesmen, Mechanics, Merchants, Farmers,** and as a Guide to **Professional Painters.** Containing a plain, common sense statement of the methods employed by Painters to produce satisfactory results in **Plain** and **Fancy Painting** of every description, including **Formulas** for **Mixing Paint in Oil or Water,** Tools required, etc. This is just the Book needed by any person having anything to paint, and makes **"every Man his own Painter."**

Full Directions for using **White Lead, Lamp-Black, Ivory Black, Prussian Blue, Ultra-Marine, Green, Yellow, Vermilion, Brown, Lake, Carmine, Whiting, Glue, Pumice Stone, Asphaltum and Spirits of Turpentine, Oils, Varnishes, Furniture Varnish, Milk Paint, Preparing Kalsomine,**

PAINT FOR OUT-BUILDINGS,

Whitewash, Paste for Paper-Hanging, Graining in Oak, Maple, Mahogany, Rosewood, Black Walnut; Hanging Paper, Staining, Gilding, Bronzing, Transferring Decalcomania, Making Rustic Pictures, Painting Flower-Stand, Mahogany Polish, Rosewood Polish, Varnishing Furniture, Waxing Furniture, Cleaning Paint,

PAINT FOR FARMING TOOLS,

for Machinery, and for Household Fixtures.

TO PAINT A FARM WAGON,

to Re-varnish a Carriage, to make **Plaster Casts.** The work is neatly printed, with illustrations wherever they can serve to make the subject plainer, and it will save many times its cost yearly. Every family should possess a copy. Price by mail, post-paid, **$1.** Address

THE TRUTH ABOUT

The DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE.

IT DOES NOT TAKE AN HOUR TO GET ready to do a minute's work, but is always ready in a minute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages: It prevents pulling or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Pleating.

The peculiar feature of DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor basting of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

The California Agriculturist

AND

LIVE STOCK JOURNAL.

Vol. 6. San Jose, Cal., October, 1875. No. 10.

LETTER FROM WOODLAND.

ENTERPRISING FARMERS--ALFALFA—IRRIGATION —MILK AND HONEY— FARM MACHINERY— FINE STOCK—POULTRY—RAISIN VINEYARD— CORN—WHEAT, ETC.

EDITORS CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL:—Thinking a few items from this part of California would be of interest to your many readers, and leaving it to yourselves to say if they are worthy of publication, I venture the following:

Woodland is a stirring town of about three thousand people, situated seventeen miles northwest of Sacramento, and on the line of railroad from the latter place to Knight's Landing, and is surrounded by some of the most productive land I have seen in the State, and if not for the heat and hot North winds I should consider it the Farmers' Paradise. In this vicinity are large bodies of white oak lbs., per acre. Thrashers are now at work on clover seed, but there are many fields that will make another crop of hay in a few weeks more. The beautiful green clover and the delightful fragrance from the blossoms has to be seen and enjoyed to be appreciated.

The wheat crop has been good for this season. Summer-fallowing is in general favor here, lands so treated yielding from 30 to 40 bushels, when winter sown yields but 15 to 25. The gale of last spring did serious damage to wheat, consequently many are looking for a variety that will ripen after the high winds cease. Proper wheat has been a favorite seed, but its ripening too early makes it objectionable. Club seems to be the choice of many for next season.

Last week I saw on the farm of J. Fowler a fine sight of 70 acres of corn of different Hogs are kept on it the year round, and a drove of 100 is a common sight. In this vicinity there are between 2,000 and 3,000 acres of clover. It makes an excellent article of hay when properly cured. Dairying is not carryed on as largely as it might be, but there is no reason why this county should not be the "Orange County" of California.

Farnham is one of the largest and best butter makers here. He makes about 100 lbs., a week, and for color and flavor it cannot be excelled. Alfalfa clover also gives the bee keeper great advantages; I saw 60 lbs., of delicious honey made in three weeks taken from two hives.

Many Alfalfa clover fields this season have yielded 5 tons of hay per acre, besides a large amount of pasturage; others, 3 or 4 tons besides a crop of seed varying from 200 to 300 press to you the many advantages of these clover fields.

Every thing seems to thrive on Alfalfa. Here are to be seen fat animals, clover-fed. verts to irrigation at once. I can hardly extrees, which no doubt gave the name to the town. Shade and ornamental trees do not thrive as at Santa Clara. Live oaks are a rarity.

The Farmers of this section show an enterprise that might with advantage, be a copy to farmers in other portions of the State. To add to the natural productiveness of the soil, they make use of the waters of Cache Creek for irrigation, and if some of our dry land farmers could see the Alfalfa clover fields now growing a third crop, they would be convarieties, some of it planted 25th of June and growing from 5 to 11¼ feet high. The soil, with proper cultivation, would produce 100 bushels per acre.

Land here is worth from 20 to 200 dollars an acre according to location and improvements.

Farmers are using the best improved machinery. For thrashing, Enrights straw burners are being introduced. Here, also, derricks with horse forks are used with nearly all thrashing machines, also Jackson's self-feeder and elevator; a great labor saving machine. I have seen Jackson's Traction engine used for thrashing, propeled over a rough road and drawing separator, traps waggon, etc. Derrick's (I think it is) Perpetual hay-press is in favor here. It makes compact bales that I have not seen equaled. Ten tons of it can be stowed on a single railroad car.

I have visited the poultry yards of Dr. J. W. Prather, and though his choicest birds were away to State Fair, I saw enough to satisfy me he has very choice poultry. His yards are located in clover, so his poultry have green feed the year round.

Before closing this I must mention the farm and vineyard of B. B. Blowers. I saw sights there that would astonish even old Californians. Mr. B. has 25 acres devoted to table and raisins grapes, and if wine men would visit his vineyard and see his "lay out" of raisins, no other argument would be needed with such of them as desire prosperity and have the good or their race in view. For bearing, size and flavor of Mr. B's. grapes and raisins, it will be hard to equal them anywhere. I saw vines bearing a second crop that had on at least 40 lbs., of grapes! Mr. B. dries his grapes on the ground, but this year he is trying a cement floor in the field. He has 700 yards of this floor already, and so constructed that in case of a rain, water will drain off quickly. I also saw the effect of two methods of prunning of one kind of grape vine. One way caused the vine to be almost worthless as a bearer, the other made the same variety very prolific. From 120 lbs., of grapes, Mr. B. has made 45 lbs. of raisins.

There again I saw clover fields and the effect it had on stock, especially in its wool and mutton producing qualities on some graded Merino sheep belonging to Mr. B., also some of the get of buck, "Silver Horn." A lot of Merinos imported from Vermont and owned by Mr. George Hammond were very fine. A lamb 7½ months old get of "Vigor" of Ohio weighed 107 lbs. On 10 acres of clover, Mr. B., has had for five months, 150 heads of sheep and 10 of cows and horses, and there will be feed enough for months yet. Mr. B., discovered that cattle and sheep that had access to his grape cuttings—of which they ate freely in the spring—did not bloat, showing perhaps, that stock running on succulent *clover need dry feed* as well. Much more might be said of this Yolo County, but fearing I intrude on your space, I close.

Yours truly, A. R. WOODHAMS.

WOODLAND, YOLO CO., Sept. 20.

The Old Saying: "There is no peace for the wicked" may be all correct, but it seems as though there was little for those who righteously choose to escape from the wicked in this vicious age.

The settlers at Lompoc made their by-laws, forbidding the sale of alcoholic liquors within the colony, with an honest and earnest desire to live in peace, and bring up their children in security from the worst foe to human happiness. They had a right to do this, and now they propose to maintain that right; we hope they will. But through a loop-hole in their by-laws, the enemy was admitted into their midst and the fight has commenced. The war with alcohol can never be ended short of total prohibition. Between it and abstinance there is an irrepressible conflict One or the other must fall.

The Lompoc colony by-laws permit the sale of alcoholic preparations by druggists upon the prescription of a physcian. A saloon keeper has only to start a "drug store" and either be a "physician" or else have a confederate capper to carry on the vile business there. This game has already been commenced as we published in a correspondence last month, and the ladies revenged the death of an innocent victim by spilling the liquor in the whisky shop, after the keeper had refused to comply with the request to sell no more as a beverage. Now "legal redress" is demanded by this trespasser upon peaceable society, and, as law seldom means justice in this country, it is impossible to foresee the result. The malicious liquor men will go to any length to crush out temperance in any form so threatening to their "business." Unscrupulous of lawyers can be found to hound the people, and, if they will stand it, they will be driven to allow whisky mills to triumph over them. We can only council one thing; let your by-laws mean *total prohibition* and fight it out on that ground in defiance of any power that whisky can command. The eyes of the world are upon you, and every temperance man and woman in the land will glory in your indomitable determination to maintain your inalienable right to life, liberty, and the pursuit of happiness.

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Of What Does Greatness Consist? Not notoriety, surely. Neither is it riches. Yet as much renown may be gained from, and as much homage may be, and often is paid to these, as to every virtue and power of mind that distinguishes the noble from the common class of humanity. Probably scores of men die every year, as they have lived, comparatively unnoticed, who are as wise, as virtuous, as self-sacrificing, as philanthropic, and who have worked as faithfully for the good of humanity as the late great Ralston of the great Bank of California. But they were not as rich in this worlds goods.

We must express our condemnation of the system of assessing nominees for State, County and town offices to pay campaign expenses. It all leads to corruption and abuse. How can we ever expect to lessen taxation when such a system is tolerated? Even the enormous salaries and perquisites now paid officers are barely sufficient to pay assessments. How can they get even but by being open to bribery and favoritism? So long as such things are permitted by law, we cannot expect economy of Government in any of its branches, nor fair dealing and justice in our courts.

Work-horses on the farm should not be allowed to fall off in flesh this month for lack of feed in stubble fields and pastures. A feed of hay, or even good fine straw once a day will pay, if it is needed to keep them in good order for the seasons plowing. Look to your horse collars, that they are in good condition and see that shoulders do not get galled and sore. Be merciful to the beast.

A Successful Attempt at seed growing has been undertaken this season near San Jose. Mr. R. W. Wilson, who has had many years experience at seed growing in New York and Iowa, put in 30 acres of onions and lettuce for seed. He produced about 9,000 lbs., of lettuce seed for Briggs Brothers, seedmen, Rochester, New York, and over 8,000 lbs., of onion seed, not contracted for. Mr. W. is now East to dispose of his crop, and to contract with seedsman to take a large crop another season. Mr. W. says that his seed produced here this season is the best and heaviest that he ever saw, and that such a good quality cannot be grown East. He was not fortunate in selecting soil that could not be irrigated either, as the season was exceptionally dry and the crop was not as heavy as it should have been. Another season this will be remedied. His success is of the most encouraging nature however, and no doubt should exist in the mind of any one as to the superiority of our soil and climate for seed raisng.

The Cultivating Fruit for Stock should attract more attention than it does. In some portions of the eastern states sweet apple trees are grown around pastures to produce fruit for cows and it is found to pay well. The cows give a superior quantity and quality of milk when fed with fruit. We have several times suggested that it would pay to plant grape vines about grain fields to furnish succulent food for hogs while fattening upon the grain. We learn that one farmer who has tried it, strongly recommends feeding grapes to hogs as a cheep and economical feed with grain. The Arabs it is said, feed grapes to their horses, which fatten on them.

Where alfalfa and squashes, and other vegetables can be grown cheaply and abundantly, perhaps it would be more economical of land and labor to cultivate them for feeding stock, than to plant grape vines for the purpose. But on dry ranches, the grape will be found just the thing. It requires little cultivation, pruning once a year being about all the trouble necessary to insure regular crops. The mission grape is an abundant bearer and will probably be found as good as any for this purpose.

Grapes are now abundant and cheap and of excellent quality. Other fruits having been scarce and dear this season, we can appreciate this "gift of the gods" all the more. There is no more luscious fruit than the grape; healthful, nutritious and bountiful. The grape vine will grow almost anywhere it may be planted and the fruit can be grown with less expense than any other on an average. It is a blessing to the world in its natural and health giving forms, but when fermented in vat and still, the product is distructive of virtue, fortune and human worth. The noble grape is not to blame for the vile use to which demoralized man may subject it.

The grape should be found daily upon the table of every family during the season of its ripeness. Put up fresh in cans as other fruit is, it will be found a superior table fruit the year round. Several fine varieties of fleshy grapes make excellent raisins. Raisins in some countries are a staple article of food, and should be more largely eaten in our own. They are very nutritious and healthful for man or beast. California should now, and probably will in years to come, supply the whole of America with superior raisins. It is estimated that 40,000 boxes will be produced this season. When selected with care and properly cured, California raisins are not excelled by any others.

The Lick Observatory, will probably be located upon Mount Hamilton in Santa Clara County, distance about 25 miles from San Jose. Mr. Lick has promised to build it there if our county will build a good road to it from San Jose, which we have no doubt will be done at once. A telescope of immense power, much greater than any ever made will be placed upon it, at a cost of nearly, or quite, one million dollars. This princely donation to science and to the advancement of mankind, will most likely develop facts that will settle many points about the planets and other distant stars, which are now shrouded by conjecture. The moon will be brought to vision close enough, so that objects upon its surface the size of a common dwelling house can be discerned.

Photographs upon delicate material can be taken and so magnified as to make objects the size of men appear plainly, for examination; at least there is nothing scientifically impossible about it. We believe that it will yet be so that the inhabitants of even the planet Mars, can be seen through these agencies. At any rate, it is devoutly to be wished, and the prospect of adding to our other attractions such an institution as the Lick Observatory will be, makes every resident of San Jose feel elated. Long may Mr. James Lick live, must be the sentiment of all.

Horse Racing at our agricultural fairs does not appear to be growing less in favor with the sort of crowds that attend such fairs, nor with the the managers of them, who appear to think that to be *successful*, a fair must be so managed as to bring together the biggest possible crowd of people and cause them to squander their money. The *National Live Stock Journal* in some sensible talk on horse racing says: "that money thus distributed, *does not encourage improvement in agriculture*, nor tend in the *least degree* to improve, in any useful characteristic, our domestic animals," and continues: "It is probable that the only way to effectually guard against this evil, is to adopt what has always been the practice at the New York State Fair; that is, *to prohibit all tests of speed!*" This would be a radical measure. We have never opposed the simple test of speed, but have always deplored the gambling, pool selling, etc. However, we would sooner see a prohibatory law, than witness any more of the demoralizing effects of horse-racing "Agricultural Fairs." A fair that is a gambling game cannot in any proper sense be called *agricultural*.

The San Francisco Board of Provision Packers advises the farmers of California to fatten hogs with their wheat, as $1,400,000 gold was sent from that city last year to buy Eastern pork and lard.

Poetry.

[For the CALIFORNIA AGRICULTURIST.]

Give Me the Hand that is Friendly Forever.

BY AGNES.

S mortals advance into life's deepening shadows,
The need of true friendship we all must confess;
It may come from the hand that is destined to labor,
It may come from sweet childhood which lives but to bless;
Yet soft palm, or hard hand, it matters not never,
Give me the hand that is friendly forever.

In the whirl of life's duties, we fail to remember
The many demands human kindness requires,
And greedily gather life's blossom and sunshine,
Whilst broken hearts perish and friendship expires;
Then soft palm, or hard hand, it matters not never,
Give me the hand that is friendly forever.

When fortune her jewels profusely bestows,
We cling to our idols and hold them in fear;
Lest friends may prove traitors, and cunningly rob us
Of much that makes living desirable here;
Then soft palm, or hard hand, it matters not never,
Give me the hand that is friendly forever.

We cast our thoughts round us and proudly exclaim,
Our friends are as legion, they'll surely remain,
But fortune escapes us; disease comes in train,
When nothing is left us but suffering and pain:
Then soft palm, or hard hand, it matters not never,
We'll cling to the hand that is friendly forever.

Sowing and Reaping.

A sower went out to sow one day,
When a city maiden chanced that way;
A sweet, wee maiden with just a trace
Of lingering babyhood in her face,
And she paused where the farmer sowed his grain,
And uttered a cry half joy, half pain:

"What beautiful things, so golden red
And shining! Pray! are they gems?" she said.
"And why do you bury them underground
Where never a sound of them may be found?
They'd be so pretty for dolly and me
To play with under the beechen-tree!"

"Now, Heaven forgive me!" the farmer said:
"But, child, my little ones must be fed!
Why, this is corn, and I plant it here,
That I may have food for them all next year.
Should I see them starve and die instead?
Nay, but my little ones must have bread."

But still the child, with a wistful glance,
Kept watching the treasure half askance,
As it dropt from his hand like drops of gold,
And buried itself in the silent mold;
So he paused and gave to her handfuls twain
Of his scarlet beans and his golden grain.

"True, it is little the likes of me
Can spare from the children's bread," said he:
"But God provides for the sparrow even,
And I am on earth and He is in heaven;
He will send his sunshine, and dew, and rain,
And give me back my own again."

A rustle, as if of a silken gown!
Or was it a bird a wing sweeping down
From yonder thicket of beechen-trees,
Or a sad-cap freak of the soft spring breeze?
What mattered it? So, with a glad content,
Again to his toil the sower bent.

—Months passed; God's beautiful sun and rain
Their yearly miracle wrought; again
The farmer stood in his field, but now
With a grateful heart and reverent brow,
For a plentiful harvest around him smiled,
And his thoughts went back to the little child.

"Sure, never was field so blessed before
As this," he said; "'twas a scanty store
I gave the maiden; but who divides
With others, a blessing with him abides"—
And his lips grew glad with a grateful tune
In the hush of that autumn afternoon.

But, see! as he gathers his fruitful sheaves,
What treasure is this among the leaves?
A silken purse! in its lustrous fold
Ten shining pieces of solid gold!
How came it here, like a gift of God,
Where never a foot but his own had trod?

Again a stir near the beechen trees!
But this time neither of bird nor breeze:—
A lady! clad in a wondrous sheen,
Of silk and gems, like an Eastern Queen;
And, close to her side, the little child,
Sweet thoughts of whom had his toil beguiled.

"It is yours, my lady"—he raised the gold—
"Nay, keep the treasure," she said, "behold,
God sends it you! It was surely He
Who led my steps by the beechen tree
That sweet spring morn when you shared your seed
With one of His little ones at her need.

"And so, if He designs to use my hand
In sowing His seed—(you understand):—
Giving me all that I want and more,
From out of the overflowing store,
Should I not scatter of here or there?
Shall you bless others and I forbear?"

O beautiful Gospel of human need
And human sympathy! Here, indeed,
Together the rich and poor may meet,
Each with his offering, helpful, sweet;
Nor this too costly, nor that too small
With Him who is Maker of us all.

Good Farmer James.

If you had known good farmer James,
Whose life in ways of labor ran,
You would have known of sterling worth—
The virtues of an honest man.

He never traveled far away;
A foreign shore he ne'er had seen,
And all his life was humbly passed
Where his forefathers' lives had been.

His fields were ample for his wish,
And yielded crops, with some to spare
For those whose lives were sorrowful
With sickness, poverty and care;

For 'twas his pleasure to assist
In every way the worthy poor,
And when the suffering came his way
No bolts were found upon the door.

Yet idleness ne'er found a friend
In Farmer James. Sloth was a vice;
And carelessness and levity
Were wrong and sinful in his eyes.

His was the ever constant aim
To help his fellows all he could;
And ne're was he so happy as
When to his neighbors doing good.

His life was simple from the first,
And when it ripued to its close,
And he was laid away, for him
No word but that of praise arose;

For he had left a legacy
Richer than gold and jewels prove—
A legacy of honest worth,
Of noble actions, and of love.

A Rainy Day.

BY ALFRED B. STREET,

The bright rain-tassels of the skies
Drop from their cloudy, leaden crown;—
And like a sponge the landscape lies
Reeking and sullen, dumb and brown.

Bushes and trees their leafy hands
Clap, as each drop their surface pelts; —
The surly hemlock, twiceling, stands
Like Fowler in a haze of gnats.

Under the rumbling cart that stoops
To drink the pool that mantles round,
Drawn to one crescent feather, droops
The curless cock, a king discrowned.

Dame Partlet in her brindled hues
Sits tamely by and preens her breast;—
White poor, drenched Tabby pevish mews
Beneath the woodshed's dripping crest

Within the dusky half-light there,
See-sawing pigeons pick the oats;
There leans the spade, and glints the share,
Dull grins the rake, the buck-saw gloats.

Moist wood-scents wander in the breeze,
Mixed with the garden's dampened sweets;
And the wet fragrance of the trees,
The rainy flail forth ceaseless beats.

The ducks roll up belighted eyes;
All talk at once, their feather's shake,
Even seek to fly, then each one plies
Way on the flowing cistern's lake.

The cow stands swinging meek her cud,
And wistful eyes the meadow near;—
While Whitey shows in many a bind
Impatience of his stable drear.

And still gray tassels streak the air,
And rumble still cart, barn, and shed;—
Rain, weary rain, falls everywhere,
And nature drenched looks dull and dead,

How desolate the sodden field!
The rubbing tree stands dank and dark;—
The fir's firm bongbis no covert yield,
Though curving tent-like round the bark.

From the wet stack the vapors shrug;—
Within yawn coverts warm and dry,
Where Brindle shelters sleek and snug,
Protected from the frowning sky.

The cottage door, swung open, shows
The streaked dusk scene within; there sits
The grandsire where the chimney glows,
Puss purs, and there the grandson knits.

The tottling grandchild rides the dog,
Or arrikes him whimpering with his whip;
Sport yells when fired on by the logs,
Then upward starts and bites his hip.

There ticks the clock with endless swing;
The wood-chairs gleam in crimson gloss;
The kitten gambols with the string,
While the domed drops the panes emboss.

The rainy day, though desolate,
Prophetic tells to-morrow's light;—
Like tears of sorrow that create
The bow which makes all nature bright.

Going After the Cows.

They waited there, by the pasture bars—
Dapple and Dolly, and Dun,
So I slip the bars in the well-worn posts,
And drop them one by one;
But I do not go, as I always go,
To see the milking done.

I lean my cheek on the pasture bars,
And watch the stars come out;
Perhaps they will miss me, up at the house,
And wonder what I am about;
But I've something to think of here to-night
While I watch the stars come out.

Last night when I came for the beauties,
Willie was walking with me,
And he asked me if I thought ever
A farmer's wife I could be;
For I am a city girl, you know,
And a farmer's son is he.

Willie wears home-spun trowsers,
And such a course straw hat!
But he face that looks from under the rim,
Is handsome and brave, for all that;
And his eyes, they look at me so queer
That my heart goes pit-a-pat.

Every night, when the work is done,
We sit in the twilight gray—
Willie and I, in the tvied porch.
And sing the hours away;
I think it's better than opera,
Or theatre, any day.

He said last night, that the summer
Is brighter because I am here,
That his work was never so easy
As it is when I am near—
And he said—but there, I won't tell,
Such words are too sacred and dear.

How pure is the breath of the clover,
That comes from the meadows mown!
How holy the sky above me,
With the twinkling lights full sown!
No wonder that Willie is better
Than men who live in town.

So I think I will stay in the country,
With Dolly, and Dapple, and Dun;
Perhaps in the far, sweet summers,
They would know should I fail to come,
In the dewy-eve, to the pasture bars,
To drop them, one by one.

The Grasshoppers' Raid.

BY EUDORA MAY STONE,

The 'hoppers came down like a wolf on the fold,
Where the corn and the wheat fields were emerald and gold;
And the sheen of their wings was as snow in the sky,
When winty clouds gather, and north winds are high.

Like the blades of the grass, when the Summer is green,
The corn and potatoes, at sunrise, were seen;
Like the prairie in Autumn, where fire has swept through,
The fields were laid bare ere the falling of dew.

And the grasshoppers spread their broad wings to the blast,
And ate every turnip and beet as they passed;
And the onions and peas that were thrifty at dawn
Waved but once in the wind, and forever were gone.

And there lay the radish, all scarlet and white,
But its "grasshoppered" leaves were a pitiful sight,
And there stood the rhubarb, so sadly bereft
That, alas! there was only its skeleton left.

The farmers of Otoe are loud in their wail,
The children are sad and the hoe wife is pale;
And the corn and the wheat fields, unmade by the knife,
To the ravenous 'hopper have yielded their life.

Farmers will always remain poor so long as they allow others to do their thinking.

SOME EFFECTS OF THE EXCLUSIVE ONE-CROP SYSTEM.

The Georgia State Agricultural Department is doing a good work, in collecting facts and presenting them in a digested form for the consideration of the farmers of that State. Geogia, like other Southern States, is cursed with the one crop system, but instead of that being grain as in California, it is cotton. But that makes no difference. Either cotton or grain raised exclusively, to be depended upon for everything that is consumed on the farm, is equally extravagant. The one crop must be sold to purchase everything else used; in California even the flour is bought with wheat sold in market.

The economical plan of farming, is to produce as nearly as possible whatever is demanded for home use. Of course the surplus, whatever it is, should be that which will bring the most money from a given number of acres with the least expenditure of labor and money—everything else being equal. In the Southern States, that surplus undoubtedly should be cotton, as a general thing, In California it may be wheat or barley, hay, stock, fruit or something else, as locality and soil and climate and irrigation facilities may determine,

The effect of the one-crop system upon the producer, the so-called farmer, has proved to be most disastrous in the South, and so far as we have observed, it is drifting in that current in California. Certainly the most prosperous farmers are those who come as near following a diversified system of farming as their farm will admit of, and those who manage to find something for themselves to do on the farm the whole season. There is no profit in idleness half the year, and no one-crop will give constant employment.

Besides, the one-crop farmers are generally in debt, paying enormous profits to the storekeepers who carry them through. Equal to at least 25 to 50 per cent interest.

As in a large measure applicable to the one-crop system in California, we append the following extract from the report above referred to:

"33 per cent of the cotton crop is virtually sold to pay debts before it is made.

"Only 20 per cent of the farmers buy entirely for cash, while the 50 per cent who buy on a credit pay at the enormous rate of 44 per cent per annum interest on what they consume, amounting, in the aggregate, in the State of Georgia, to the astonishing sum of $4,250,000—*four and a quarter million dollars* paid by the farmers *in interest* on what they consume. Is it remarkable that farming is not profitable under such a suicidal policy? No legitimate business can pay 44 per cent per annum on the capital necessary to conduct it, and live.

Another instructive lesson taught by the above answers is the fact that 80 *per cent* of those who raise their supplies make a profit, while 75 *per cent* of those who buy lose money.

"The difficulties teach their own lessons, and suggest their own remedies:

Experience and these facts teach that, *raising cotton to buy supplies to raise cotton, at present prices, leads directly to bankruptcy and ruin.*

That those who *raise their own supplies make cotton at a profit, and are prosperous.* Indeed, correspondents generally report that those who raise their own supplies *cannot lose money*, if they attend to their business.

"Under the present system, *six and a half millions of dollars* which should go to swell the annual profit of Georgia farmers, find their way into the pockets of others, mostly beyond the limits of our State, in consequence of the suicidal policy at present pursued, of buying what should be raised at home. Will not our farmers make their farms self-sustaining—raise their supplies and pocket these profits?

Discard the old habit of boasting of the number of acres planted, the number of plows run, or the number of bales of cotton made, and look well to the number of *dollars of clear profit.*"

THE USE OF DRY EARTH.

We are requested to again call attention to the importance of using dry earth to prevent the bad and dangerous odors and emanstions from privies and other accumulations of filth near dwellings. It is undoubtedly a subject of more importance, than any person not conversant with it would suppose. It is not at all necessary that a foul nuisance should be tolerated, where persons must inhale noxious gasses loaded with the germs of disease and death, and which are foully disagreable as well as repugnant to every delicate sense of cleanliness and decency. And yet, stinking privies are the rule in town and out, and will be probably until prohibited by some legal enactment, as they should be, for the public good. It is no sign of want of intelligence even, to find such a thing close to one's dwelling, but because they have become an institution, as it were, like many other evils which are tolerated, and are too common to elicit either particular thought or comment; they are passed by as a natural consequence.

Now it is the simplest thing in the world to remedy this abomination. The old privy building need not be torn down—and may be even drawn nearer to the house or woodshed. It should in fact be placed in a position where it can be entered in fair weather or foul, night or day, most conveniently by the family. But instead of a vault, have made one or more strong boxes that can be drawn out when filled from the side or back of the privy house and dragged to the vegetable garden or some suitable place for emptying.

A board can be so fitted as to slide in place when the empty box is replaced, so that there will be no exposure of interior arrangements. A barrel or other vessel should be placed inside the privy building, to contain pulverized dry earth. In this should be placed a dipper, shovel or scoop, to cover the excrement. Each member of the family should understand that it is their duty to always cover at once with the earth. Enough dry earth to absorb all moisture should be used, and it will be found best to not throw liquid slop into the privy boxes, but turn it on to the earth outside; have a place spaded up where it will be at once absorbed away. This earth will become enriched, and may in time be removed to the garden for fertilizing purposes. No family that tries this will be satisfied with a foul smelling privy on the premises again ever. The trouble will be more than repaid in cleanliness and comfort.

The patent earth closets are very nice for house use where there are invalids and infirm persons, and with proper care are in no way offensive in any bath or sleeping room.

A kerosene can, with top cut out, and the bail of an old pail fastened to it to carry it, makes a good vessel, and a box can be made to contain it with a hinged top with a hole through it, and another lid, also hinged, which can be covered to resemble an ottoman. The box should be long enough to contain another can filled with dry earth, to be used as required. There is no patent on this piece of useful furniture, and any man or boy can make one.

Dry earth can now, before the heavy rains, be obtained in any quantity in roads, fields, and almost anywhere. Road dust is excellent. It can be stored in outhouses by the wagon load in large boxes, barrels, etc. It is not only good for the purpose named, but is found to be excellent to use in stables, quite as good as saw dust or tan back. A quantity in a large shallow box for hens to wallow in during the winter, will be found excellent to relieve them of vermin. As a disinfectant and absorbant of putrid odors and matter in sores, dry earth has been found to be very excellent, and medical practitioners have largely adopted its use in many cases, where usual remedies are unavailing, and with most gratifying results. But of this we only make mention. The virtues of dry earth, as a sanitary agent in privies should commend its use to every lover of decency, and "*now* is the accepted time."

AN ENDORSEMENT.

"My faith in its honesty, candor and devotion to the interests of the farmer strengthens with every number."

As a sample of the many encouraging words we are constantly receiving in private letters from our subscribers, we take the liberty to publish the following:

Editor Agriculturist—*Dear Sir*:—I enclose herewith, Postal Order, for $4.00 in payment of amount due on subscription—the balance to be applied in prepayment, after deducting one dollar for "How to Paint," which please forward to my address by mail. I have been weeding out my periodicals, and have struck several from the list, but I could not spare the Agriculturist. My faith in its honesty, candor and devotion to the interests of the farmer, strengthens with every number, and I am only sorry that I cannot say that of other agricultural journals published on this Coast.

You have my best wishes for your success, and I remain as ever, a friend to the little monthly. R. G. Dean.

Antioch, Sept. 9, 1875.

"A LITTLE MORE GRANGER TOO."

The poor "wine-growers" of California, hoping to flounder out of the mud of despond have sought for relief through the grangers. They want to establish Grangers' wine and brandy manufacturies, and to sell their products through grange agencies, etc. A little grange sugar is needed to sweeten the business and make it respectable. Probably the "growers" think that a little grange manipulation will make the stuff "as milk for new born babes" and add other virtues fitting it for the use of Christian families, and making

it really fit for the Gods! The alcohol it now contains, which is the one thing that makes it desirable, will be deprived of its drunkening qualities or power, and be harmlessly exhilerating and charmingly extatic in its manifold goodness. Partakers thereof can then get glorious without getting drunk, and then growing appetites for something stronger will lead only to a harmless indulgence in a little more granger wine and brandy.

WARNING TO IMMIGRANT LAND PURCHASERS.

Strangers should understand that so-called immigrant-aid agencies, claiming to be connected with the Grangers, or officially created by the State, are frauds, the object of which is to sell the land of private individuals at extravagant prices, the agents of the so-called societies participating largely in the profits.

The above we clip from the San Francisco *Real Estate Circular*, and endorse it too, although some of the "leading" head grangers have, along with the leading grain monopolist of the Pacific Coast, endorsed Josiah Earle's Grange Agency, notwithstanding the exposure of the Earl "Inyo Grab" and other swindling land complications. We have heard the term, "stealing the livery of the Lord to serve the devil in," applied to many things, and think it might with pertinance be used to fit the many cheeky and self-assuming people who use the word "granger," to carry out schemes of imposition to feather their own nests. We think it high time to cry out against such abuses, and so far as we are concerned, we have seen enough to make us look with suspicion on any branch of business that bases itself upon the word "granger."

We are not by any means fighting against grange principles, we believe in them in their highest interpretation; but that class of middle men who are natural suckers, and who wedge themselves in to parasitically feed upon the confidence and credulity of honest people, whom they deceive by false pretentions and by misrepresentations, we have neither love nor respect for. We advise such as would avoid middle men, to deal directly with first parties in land and other matters. And further, that if they seek to transact business through agents—as is often the most convenient and best way—to look for such men as are able to honestly stand upon their own merits, and who have too much honor and human modesty to sail under any patronizing flag.

We would louldly warn emigrants, and others, to keep a sharp eye on all pretenders. The most villianous land sharks in existance can be found in California.

OF WHAT ADVANTAGE IS IT?

We are asked of what benefit to farmers is the so-called "Grangers' Bank?" Can a farmer in need obtain money on any more favorable terms from this bank than from others? Will they require any less mortgage or security, and will the giving of such security cost less than at other banks? Will the Grangers' Bank in a measure lower the rates of interest so as to encourage industry, and more nearly equalize the powers of capitol and labor instead of bolstering up speculation and usury? Now these questions are certainly to the point, but with the best information we can get on the subject, we cannot give a favorable reply. The money in the Grangers' Bank is furnished by stock-holders, who expect to get as good, or better returns than through any other source. The bankers are bound to favor themselves and their stockholders and depositors in preference to anybody else. The saying that "corporations have no souls," looses none of its significance when applied to the Grangers' Bank. The name, and the means of acquiring capital, have given to the bank and bankers power which they could not well have acquired without it. The poor "grangers" have to carry a big load when they shoulder banks owned by ambitious individuals and controlled so as to make money out of the people; and real estate offices conducted on the same selfish principle, and business concerns that are looking more to their own profits than to anybodys else good.

An unselfish co-operative concern, conducted upon a code of principles that are truly equitable and in the fullest sense co-operative, would undoubtedly be of much benefit to the people who might patronize it. Anything less than that is not, as we can see, much improvement over the old ways of doing business.

If we are mistaken in our estimate, we would like to be set right in the matter.

STARVING STOCK AND BURNING STRAW.

We see by our exchanges that feed is getting so short on the sheep ranges in Tulare county that many thousands of sheep are in danger of starvation. It has been the practice of grain-growers in that vicinity to burn straw—thousands of tons of it every season, instead of stacking it for the use of stock. To be sure the grain-growers and sheep-breeders are different persons; but is it not equally as disastrous to burn the straw as though straw and sheep all belonged to the same person? If care was taken to save the straw in the valleys, it would feed, in dry seasons and in winter, all the stock that the mountains could pasture during Spring and Summer. Straw in stack a dozen years old is better for stock than new straw, and we believe it would pay any grain-grower to stack his straw for stock, and when it is needed sell in stack to sheep and cattle herders. Is it not a crime to destroy feed by fire, and starve stock for the want of it?

A School Girl's Ideal.—Grace Hunter writes to the *St. Nicholas* for August:

"I want to tell the girls something. It is about a good use for the frames of old umbrellas, sunshades or parasols. You just open them, strip off the silk, sharpen the handle to a point, and thrusting them open in the ground let them serve as trellises for vines. Last Summer we girls had a lovely sweet-pea vine growing over mother's old parasol frame and a balloon vine training over father's old castaway umbrella. They were lovely."

"I have lost flesh," said a topper to his companion. "No great loss was the reply, since you made it up in spirits."

FARM LABOR IN CALIFORNIA.

We have several times expressed our opinion on the subject of farm labor and laborers in California. The following from the Sunday *Chronicle* gives a very correct idea of the general condition of things as at present existing. What is said contrasting our labor-system with old-time slavery is not our idea, but the balance we think not overdrawn:

The system of farm labor in California is undoubtedly the worst in the United States. It is bad for the farmers themselves, and worse, if possible, for those whom they employ. In many respects it is even worse than old-time slavery. That, at least, enabled the planter to know what labor he could depend upon in any emergency, and made the laborers certain, at all times, of shelter, clothing, food and fire. Our system does neither. The farmer must take such help as he can get—hunting it up when most hurried, and paying whatever is demanded. The laborers themselves, knowing they cannot be permanently employed, demand high prices, do their work carelessly, and start out on a tramp for another job. Under our system, large numbers of men are wanted for a short time—more than any ordinary farmhouse can accommodate, even if the employer dare trust so many strangers within his walls, or admit them into his family circle. The result is that laborers are compelled to sleep in barns, outhouses, or in the open fields. In this climate that is no hardship, it is true, but the practice leads to uncleanliness, carelessness of appearance and recklessness of conduct. Men seem thus to have been thrown outside of social influences, and even if at the outset possessing good impulses and habits, they become in a short time desperate, degraded and criminal and perhaps all three. They are no worse than almost any others would become under similar influences. They are shut out from all the purifying influences of society and home as effectually as so many sailors or soldiers. What wonder is it, then, that five out of six in the class of farm laborers, unemployed for half the year, become worthless, drunken and dissolute tramps and outcasts? There is no condition in life more unfavorable to the morals of men than that which great numbers of our farm laborers occupy. They annually squander in dissipation, and generally do it in a few weeks, all they have earned, and hang around the towns and cities the rest of the year, hunting odd jobs and living, pecuniarily, from hand to mouth—not seldom by charity. There are exceptions we know. Here and there a man having sterner stuff or more intelligence in him than the rest, will rise above the wretched position that he holds and become a useful citizen. But that system is certainly a bad one that subjects laboring men to such degrading and damaging influences. And yet, bad as it is, and as intelligent farmers admit it to be, we see no present remedy. When our farms become something else than wheat fields and are made to produce a greater variety of crops, requiring labor at all seasons, the owners can furnish steady employment to thousands who are now compelled to be mere tramps under the pressure of dire necessity. Until that time comes we see no prospect of any improvement in the condition of farm laborers.

The other day I was planing a board, and by accident planed one shaving the wrong way of the grain. Of course the surface was left rough. Turning the board, I noticed that it took more than one driving of the plane to get the surface smooth again. It was necessary to go over and over again. "There," thought I, "is life illustrated. One wrong stroke cuts deeply and roughly. An evil deed eats like a cancer. Long, weary years hardly efface the errors of a day."

Correspondence.

Letter from a Lady-Canvasser.

FLUME CAMP, Santa Cruz, }
Sept. 7th, 1875. }

DEAR HERKINO:—Bright and early yesterday morning Pony and I left Santa Cruz with a roll of the "AGRICULTURISTS," for a canvassing trip up in the vicinity of Felton. The new railroad was met, or rather first came in sight at a point some ninety feet above the road on the left, immediately opposite Mr. Peyton's fine residence which is in process of completion, above the powder works crowning the hill on the right. So gradual is the rise on this delightful road, that it seems almost incredible that the level so indispensable for railway travel can be maintained with the road at first so far up on the mountain side, and then crossing the road several times on trestle work, finally on a level, then gradually winding far below, following the bank of a stream till several times lost amid the growth of foliage, which seems like underbrush; then approaching nearer in view, passing through a short tunnel and coming into Felton side by side with us.

Here, leaving the well-watered road, with its cool shade of lofty trees which made the ride so enjoyable, we passed on through the dust toward Flume Camp. Upon leaving the terminus of the railroad, the flume became the chief feature of the landscape, with its high scaffolding lifting it at times above 90 feet from the surface of the land or stream, and again coming down to level ground and laid in cuts to the depth of ten or fifteen feet. It is a wonderful enterprise and the projectors deserve much credit, and will doubtless reap a rich reward. Flume Mill is located fifteen miles away, from whence lumber is floated, as fast as sawn, for completing the structure.

A mile out of Felton I found the camp where the employees were fed and sheltered, and near by rose the white tent of our friend. He was busy on the Flume, but his delicate wife and sunny-haired May (a child of nine years) were revelling in the sunshine of their novel home, gaining health and strength every day, by the natural appetite and resting sleep resulting from a life in the open air.

Anxious to explore still farther before the heat of the day, we followed on over the dusty road till Lorenzo was reached. This was the town which sprang into existence, mushroom-like; when the Flume enterprise was first undertaken. A blacksmith's shop, store and post-office, hotel and saloon form the nucleus of a town in these parts, and by the noise of saw and hammer resounding on every side, one is impressed with the idea of growth and prosperity for this new settlement, to supersede the already well-established town of Boulder Creek, a few miles beyond.

Just at "The Forks" stands the Temperance House, kept by a former San Francisco merchant who, preferring the wild mountain life, has built himself a home in the wilderness.

It was here I partook of an excellent dinner and formed the acquaintance or one of your former patrons, who willingly renewed his subscription and paid the CALIFORNIA AGRICULTURIST a compliment most gratifying to hear. The list of new subscribers accompanying this letter is largely to be credited to assistance of its staunch friends.

Wondering what there might be to attract custom to a Temperance House in a locality where stimulating drinks are considered so essential to happiness, I ventured to suggest to the proprietor that the presence of good books and papers, pictures and the like might aid in rendering his house more attractive to all. He replied that there was no need of anything of the kind to call custom to his place, for even the drinking sort preferred a quiet place to get a comfortable meal and undisturbed rest at night.

Here, then, is encouragement to inn-keepers whose consciences are alive to the harm done by spirituous liquors. Temperance is defined as the moderate indulgence; but among a people who cannot discriminate between sufficient and over-indulgence, prohibition becomes necessary. Hence, the word Temperance is made to mean Prohibition, since it is better to restrict the appetite for anything which acts like poison to the living organism.

Coming back to camp and partaking of a sumptuous meal in the open-air dining-hall, which was adorned on every side with the most inviting landscapes, we wondered at our former in-door contentment, when here all nature was so calm and peaceful, with nothing to disturb the perfect harmony which prevailed. The moon shone calmly down upon us as we sat about the camp-fire, relating experiences and exchanging views on various subjects, till the feeling of drowsiness warned us it was time for sleep.

And thus ended the first day's exploits at Flume Camp. E. R. VAN V,

Weeds as Water Purifiers.

Mr. J. J. Mechi writes as follows to the London *Agricultural Gazette*: Into my pond runs a stream of twenty-five gallons per minute of pure water from a drain which I cut twelve feet deep some thirty odd years ago. Weeds will grow and thrive in this pond, and we have annually to take out large quantities of them. They look very beautiful as they grow in the pellucid water, which is used for household purposes. Said a visitor to me one day: "If you had a pair of swans, your pond would be free of weeds;" so a kind friend presented me with a pair, and very soon they cleared the pond, pulling the weeds up by the roots and feeding on them. My family were delighted with the graceful swans and the removal of the weedy obstructions to boating; but although the pond was free of weeds, the water was no longer pure and pellucid, but most decidedly muddy in taste, and when the steam issued from the kettle, the smell of mud was unmistakable. Well, no one thought it could be the swans, but at last I came to the conclusion, and, despite family and other remonstrances, returned them to their original owner. After a short period the weeds reappeared, and as they increased in bulk, the water gradually assumed its pellucidity and purity, and "Richard was himself again." What the weeds do for the water and its occupants the land vegetation does for the air; men, animals and other living creatures poison it, while vegetation absorbs the injurious gases, and reconverts them into wholesome food and fuel for man and beast, filling the atmosphere with that precious oxygen without which men and animals and other living creatures could no longer exist. So it is in the vast ocean, whose living occupants and vegetation probably exceed in quantity that which is on land. We owe to the river vegetation much of the purity of water. It is the excess of impurities from our towns which are beyond its powers of appropriation.

Leverrier has discovered another planet, which is his sixth.

Educational.

Going to School.

AH, the going to school in my girlhood,
In the little red schoolhouse so low!
By the flower-sprinkled pathway in summer,
In winter o'er crisp-drifted snow.
Oh, the freedom from care and from troubles!
There's to learning no royal road,
Yet the old-fashioned country children
Their way right royally trode.

How brimful of fun and frolic,
As well as of study were we!
My schoolmates—black-haired, brown and golden
Memory faithfully pictures to me,
How we played on the grass 'neath the maples,
In the noonings, or down the green lane
Went in search of such berries delicious
As we never shall gather again!

How we doubted the wisdom of teachers,
Nor grew quite as wise as we might,
Our eyes from the page playing truant,
To the clover-field blossoming bright.
When four o'clock came—Oh, how welcome!—
Farewell then to lesson and book,
How often we lingered home-going
To lave our brown feet in the brook!

Oh, how well-remembered the school-room,
The desks and the benches so high!
The windows, all guiltless of shutters,
Ah well! but those days have gone by.
Yes, e'en the red schoolhouse has vanished;
At the new one 'neath sheltering trees
There is teaching, with "modern improvements."
Were the former times better than these?

And my schoolmates, like autumn leaves scattered,
And some of them—lying as low,
Beneath costly tribute of marble;
Over some, the forget-me-nots grow.
And the living—the lab'ring, the loving,
The hands and the hearts that are full—
We are learning full many a lesson—
We are scholars still going to school.

And when the long school day is finished,
"Life's sun sinking low in the west,"
Glad children, with hope undiminished,
May we seek our home joys and home rest.
If we linger awhile by the wayside,
We'll still keep sweet home in fair sight
At the gate, with "we'll meet in the morning,"
Sweetly bid our companions "Good night."

Educational Notes.

BY CLEON.

In the great work of educating the youth of this nation, there is no teaching so badly needed as the teaching of the teachers themselves. Not that the teachers as a class are not a very intelligent portion of community; not that they would not compare favorably with any other class, whether considered morally, socially, or intellectually; but that as a rule, they do not reach the standard their vocation demands and implies—that they as a class, need more intellectual capacity, and greater moral and social excellence.

In order to understand the capabilities of the teacher—to understand what he should himself be, it is necessary to know what he has to do. The question may be easily and flippantly answered—satisfactorily too, to those who do not care to look into the depths of the argument—that the business of the teacher is to educate—to educate the rising generation. But those who would go below the surface might ask what *is* education? what is it to educate the youth? And having answered these questions, they should next ask whether the teachers as a rule are equal to the task.

Education is development. And a proper education is the harmonious development of faculties. The farmer who plants and tills his fields, educates so to speak, his growing crops. The stalk of indian corn has been educated through the ages, from a plant much inferior to that whose harvests now load our

fields and fill our granaries. The wheat plant has been educated from the plant growing wild in France, known as Aegylops, and much inferior to the plant now cultivated as a food plant and known to botanists as *Triticum vulgare*. The crab-apple has been educated into a thousand varieties of delicious fruits greatly superior in size and flavor to their crabbed ancestors; and within the memory of the youngest of us, the strawberry has increased greatly in size, putting on the proportions of the Russel, the Wilson's Albany, and the Triumph de Gande.

The horse is educated, when his power, symmetry, and speed and whatever other qualities he may possess, are brought out. The many varieties of this noble animal, from the shetland pony not larger than a Newfoundland dog, to the English dray horse, almost elephantine in proportions, demonstrate the capabilities of the animal organism for impovement.

The great varieties of the human race itself, allowing the received opinion to be true, that all mankind have had common ancestors, seem to show that man too is subject to the general law, and is capable of progress as a race. It is not altogether because the men and women of this age have grown up under the civilizing—the educating influences of the nineteenth century, that they are intellectually and morally superior to their savage ancestors who feasted on the blood and fat of their slain enemies. But it is because they are constitutionally superior intellectually and morally, an effect due to the civilizing and humanizing influences of the ages. Man is not only progressive as a unit, but the race is capable of development, and for this reason he stands to-day, both in his moral and intellectual nature, and in his general civilization, superior to his condition in any former period.

San Jose, Sept., 16th.

Economy of Live Stock.

The man who allows nothing to go off his farm in a bulky condition, will surely lay up an inheritance for his children if he does not handle as many dollars in his own lifetime. The best policy for a farmer who has a good hay ranch is to own cattle or sheep or hogs enough to eat on his place all he produces, and though he may not for a few years perceive any increase in production, but a little time can elapse before this plan can vindicate itself. If he has not at present the means to stock his place, the next best thing is to get stock on shares or to pasture by the month, or in default of being able to do either of these things on satisfactory terms, then, instead, he should try and sell his hay to be fed out on the place. We know of some farmers not far from the city who are following this plan very successfully. They have large portions of their farms seeded in alfalfa, and cut annually from four to six tons of hay to the acre. They put this hay into barns or well built stacks, and sell it to men who follow the lumber business in the mountains, to be fed on the ground. Men engaged in the lumber business in the mountains work cattle during the spring, summer and autumn, and turn them out to recruit during the winter. They come down into the valleys and buy hay and drive their cattle down and feed them with it. A large number of tons of alfalfa have already been sold this season on the Sacramento river in this way at $7 a ton in the stack. Aside from the gain to the farmer this is much better than to bale and haul it to town and sell it at the usual rates, say from ten to thirteen dollars a ton.—*Record Union.*

An exchange thinks the pews of some of the churches ought to rest on pivots, so that the occupants could see who comes in without straining their necks.

Stock Breeder.

The Charm of New or Foreign Breeds.

The tendency of American stock-breeders and dealers, says the *New England Farmer*, seems to be to obtain something that is new, or that is supposed to be new—something different from what is already generally known by the farmers at large. It does not satisfy their ambition to take a breed of animals and by careful breeding keep them up to a high standard, or even to improve them by judicious crosses, and by intelligent systems of breeding. There is too much work about this. They want to reach the desired end by some short cut. Of course we mean those breeders and dealers who class themselves as "fancy" farmers, and who expect to make their fortunes by selling stock at fancy prices. It is a little amusing to watch the progress of events in this business of breeding and selling fancy animals. At one time a chicken with a peculiar arrangement of the comb will shake the country from the Atlantic to the Pacific, and after after a few years no chicken of this peculiar breed will be allowed in a show coop unless it comes up to the standard as regards this little matter of a comb. The knowing ones, seeing no chance to make money much longer in this direction, start a new feather of a certain shape or color on some one of the trio, and immediately a great sensation follows and lots of money is made by those who, having been warned in season, are prepared for the rush. One of the latest sensations in the poultry line is a pea-comb on a trio of Partridge Cochins, and doubtless there are already hundreds of anxious breeders ready to pay a big price for the few eggs that the owner can be prevailed upon to spare of this very desirable acquisition, next Spring. If the new breed can boast of *foreign* origin, all the better. The word "imported" has a peculiar charm for the ear of the average American, whether it refers to a breed of cattle, sheep or poultry, or to the cloth of a coat or the shape of a hat.

The following letter from Mr. F. D. Curtis, of Charlton, N. Y., to the *Rural New Yorker*, contains views which accord with our own sentiments quite fully on this point. He says:

I notice in the *American Agriculturist*, Mr. Joseph Harris, in his "Walks and Talks," has at last come around to my way of thinking in regard to breeding English sheep in this country. He says, "It is not an easy matter to keep our sheep up to the English standard." I say it is impossible, and have argued that not only the climate was against us, to which Mr. Harris alludes, but that the English system of feeding produces an excessive growth, consequently a weakened constitution, ill adapted to our rigorous and changeable climate; and being thus pampered, I insist that there is a constitutional propensity inherent, requiring more stimulating food than American farmers usually feed; and moreover, if we follow the English formula to the letter the sheep will deteriorate. Mr. Harris brought out an important fact in this connection which substantiates my position and sheds light on the English system of breeding, and at the same time shows the absurdity of the *glamour* of "imported" when he remarks:

"We often hear of 'improved' Cotswolds or 'improved' Leicesters, or 'improved' Berkshires, which I suppose simply means that they have been crossed with some other breed. Bring this 'improved' stock here and keep it here, and it will inevitably degenerate. It is easier to make an improvement than to keep it." The measure of honor among American breeders will not admit of these crosses to keep up the standard with the various thoroughbred breeds, as custom has established a law requiring a direct descent from imported stock. After we cross the water no questions are asked and no guarantees are required from sheep or pig breeders. It is evident from these facts that the English breeder has a great advantage, owing to the gullibility of Americans and their fashionable weakness for imported stock. The English breeder can doctor, pamper and cross his pigs and sheep without limit, and call them whatever names he choose, and his enterprise is accepted by the Americans as standard authority. How long shall this nonsense continue? Is it not time that we began to establish American breeds?

Breeding.

There is too much truth in the charge that many farmers and breeders of stock are content with merely knowing that a stallion is a horse, a boar is a hog and a ram is a sheep. They know nothing and care as little about the "points" and "blood" in stock, and not unfrequently will charge that all the talk about those principles is mere moonshine, and they can do just as well without paying any attention thereto; that they know a good animal when they see it as well as your best judges, and they would not thank any one to judge an animal for them. Too many of this class of men, when they wish to increase their herd, resort to a scrub male in preference to a thoroughbred because of the difference in the price of service. Especially is this true as to the stallion from which they breed; and as for buying or breeding to an animal of unquestioned purity of blood, that never entered into their heads. We are glad to believe, however, that this class is gradually growing less each year, under the influence of social reformatory processes and more light pouring in among the great mass of farmers and breeders; and no effort should be spared to reduce the number to almost none. Let a few stand as mile posts and warnings to others, to show the errors of such a course.

Upon this important point the *Prairie Farmer* has some good suggestions appended, saying: "Breeding continues, as it ever must, to occupy the attention of those interested in stock. Skill, science and sound judgment invariably, when combined in the breeding of animals, meet their due reward. Money can not purchase success, as the price willingly paid for successful breeding is sufficient to stimulate all to their utmost to attain prosperity.

That any one can lay down "laws" for breeding that must result in success in all cases, is ridiculous. That any man can, from the breed of any animal, positively assert that he is to be superior to all others of same age and class is equally preposterous. There is no doubt about one thing—that known purely high-bred, tried families, with fine make, shape and action, train on and cut up much better than any man's judgment could detect, without a knowledge of the breed of such families.

Some men of great practical experience will tell you all horses that are thoroughbred have an equal chance. This is a great fallacy. Stout hearts, good dispositions and constitutions are absolutely necessary training to test their stamina.

The very finest and best bred horses in the world, without true formation, action, soundness and stamina, cannot compete successfully with those possessing these qualifications.

Then it seems rational that breeders of horses should not blunder on in the dark. They should study to breed from highly proved stallions with true formation and symmetry, without which the *action* cannot be *true* and *lasting;* and inasmuch as the stallion, in nine cases out of ten, moulds the locomotive power of the produce, both as to size and true formation, how requisite it is that the original should be perfect in this respect, as well as stout, good and highly-descended, with all other good qualifications. Many of

our best horses, possessed of brilliant speed, courage and stamina are not adapted to hand these qualities, with any degree of certainty, down to their offspring, unless very carefully examined before they are made *beastly fat*, and their weak points counteracted by being crossed with certain strains of blood known not to possess their idiosyncrasies—*i. e.*, peculiarities of temper, disposition, formation, soundness, etc.—*Rural Sun.*

Household Reading.

The Cottage.

BY JEFFREY OIFFORD.

WHERE the cosy cottage stands,
By the silver streamlet bright,
Graceful hills and meadow lands
Mark a region of delight.
On the warm slopes light does stray,
Rosy-footed all the day.

Rural paths lead here and there,
Fringed with leafy colonnades,
While children, free from strife or care,
Frolic on the velvet glades.
Farther down the village spire
Is all ablaze with crimson fire.

Still further on, the stream winds round
At the foot of yonder wood,
And the bordering edge of ground
Serenely glows for many a rood.
Where the placid brook flows deep,
Rich pastures feed large flocks of sheep.

Milk-white lambs here sport and play,
Till in gambols weary grown,
As slowly fades the waning day
And the fields look drear and lone;
Yet the glens are flecked with foam,
Where the dancing waters roam.

Forever, day and night the same,
The babbling spring is bright and clear,
And prattling child and aged dame
Here watch its ripples year by year.
Near by, great oaks in stately pride,
Stand close together, side by side.

—[Pen and Plow.

Chats With Farmers' Wives and Daughters---No. 10.

BY "JEWELL."

Girls, don't be in a hurry to marry; don't marry for a home, or from fear of being an *old maid*. While true marriage is the perfect condition of both sexes, an unsuitable match is sure to be unhappy, and is to be regretted by all. Few girls before twenty fully know their own minds or hearts; and as marriage should be controlled by both, it is very essential that we use our minds *first* and our hearts afterwards. In choosing our friends, let us be sure they are men of principle rather than of money. And while we cannot intend to marry *all* our acquaintances, still, if we show a preference for men of good habits, good health and sound principles, we silently place a premium on such qualities: and if all girls did the same, few men would cultivate such filthy, expensive and unhealthy habits as drinking, chewing and smoking.

Talk about woman's influence! Of what use is it if she does not exert it to elevate the opposite sex? Of what benefit to her or her friend to be thought pretty, lady-like and well-dressed? And yet these are the charms most girls seem to desire, without a thought of the good she may do in educating, or keeping alive and active, the *good* which is in all; and by trying to benefit others we are always elevated.

Then, who more time and ability in beautifying our homes than our daughters? They are full of youth and beauty, and ready to catch the spirit of beauty wherever seen, and in a thousand ways adorn corners and walls in fancy and useful articles, which we of family cares and anxieties do not get the time to do, though the love is in our hearts all the same.

I thought to myself the other day, while making a call on a farmer's daughter, that a country life was more prolific of beauty in every way than a city life. Now, girls, take note, and see if you can produce as much beauty out of little as I saw. Outside on the porches were rows of plants of great variety and beauty, many of them rare and expensive to buy, but raised from slips were inexpensive and doubly dear. Stepping inside the dining-room, everything was charmingly simple and yet full of use and beauty combined. A substantial paper-holder I especially admired, made of stiff paste-board, covered with fancy dotted paper, with a scroll running around the entire edge which the daughter said she cut from wall-bordering, and two boquets pasted on the front quite finished its beauty. A long cord suspended it from a nail, and two screws held it firmly in place. Under it stood the sewing-machine, and a linen cover bound with crimson braid, gave it a tidy look. In the parlor, cool and neat in white matting, stood an open piano, with pretty things upon it. Before one window was a tiny stand with a gold-fish globe filled with trailing water-plants—the variety most charming to behold. In another window was a square squarium, filled with shells, stones, fish and growing water-plants. Suspended from both ceilings were phantom fly-catchers. The spare room was a marvel of whiteness, and the pretty comb-holder beside the glass was of paste-board, bronzed with this shoe-bronzing, and tiny boquets pasted on. Such did this farmer's girl make her surrounding, while she herself, full of health and life, was the joy of her delicate mother, a large circle of friends and the soul of the house. Such a daughter cannot fail to make a wise choice in marrying and be a good wife, no matter what her station in life may be. Why? Because, in the first place, she is making the most of herself now by cultivating the æsthetic nature, as well as the practical. Secondly, she is not devoting her entire time and attention to the adornment of her form and face, as so many girls do. And thirdly, she is healthy and robust from simple habits and early hours, fresh air and sunshine, instead of giving her freshness and roses to the theatre and parties, where most of our young people spend too much time and money. Having time for reading and choosing the best, she is capable of mature thought on all subjects, and such I found her to have in conversation. I feel sure there are many such in our country homes, if we only could find them.

GRANDFATHER'S LETTERS---NO. 1.

Something About Married Life.

Dear Jewell:—I cannot but feel thankful that one has stepped forward to apologize for, and in a measure excuse, that boorishness in husbands of which "Esmeralda" has but too much cause for just complaint. On reading "Esmeralda's" letter it brought to mind my earlier days, and with it self-conviction and a wish that I could do something, say something, to make things better in this particular, and your expression, "hoping to hear from the other sex on this subject," encourages me not only to think but to say. Not but that I may expect the editor will cast this into the waste-paper box, from having something so much better thought and said on the subject. However, knowing that my sex is not so prolific on this subject as yours, I will venture to send this. If you have a variety to choose from, all the better.

I recognize an abunpance of truth, both in "Esmeralda's" letter and in your reply; and following your example, "as a text to my chats" on this subject I take the single word,

"SELFISHNESS."

The present usages of society are such, that our sex are the first promoters, in its incipient stages, of the conjugal relations, and it is too much for E. to say, "she has chosen this one man from all the world." With her it is but too often "Hobson's choice"—this or none. No, the choice falls on our sex; hence the responsibility, and doubly so the imperative need and right of the subjugation of self in favor of the wife of *his* choice. And I appeal to the conscience of every one of my fellow-benedicts, and ask if they were as much or more concerned for the happiness of the one to be chosen, before she was chosen, as for their own happiness? Should she not have the approbation of his head and his heart, the one he had in view, of whom he contemplated making choice? Was self rather a secondary consideration, the primary one that of the happiness of the one he is about to draw to himself away from former friends and associates, away, oftentimes, from elegancies, or at least great comforts, to a rougher mode of life? Where there is mutual love and heroism enough to start on this foundation in the varying shades of life, the right beginning is made. Now, to keep it up and go on from good to better is the *desideratum*, the thing to be really desired, as well as to avoid that degeneracy from bad to worse, as we see is too often the case. For this, also, each party has ample responsibility, but most devolves on our sex as the stronger party—the formation party. And let us see that we don't repeat the old garden story, and shirk the blame on *her*, whom in this instance we have chosen.

To do this we must habitually feel our great responsibility—habitually feel how we should demean ourselves by a hasty, ill-tempered word or unkind look—habitually feel the importance of keeping up that sanctity of manners, that polite, courteous demeanor so agreeable to all. Are we to suppose it to be less so to her, with whom we have chosen, above all others, to be in daily contact. To some, all this kindness appears to flow forth spontaneously, while to others it requires a good deal of careful and continuous cultivation. I take it we shall be the better for a little timely thought on the subject.

There, dear "Jewell" and "Esmeralda," before giving more on your subject in view of making it a success, I submit this for your criticism. Throw it aside, or say you will have more from GRANDFATHER.

A Contrast.

EDS. AGRICULTURIST AND LIVE STOCK JOURNAL:—I picked up my scrap-book yesterday and saw this piece which I thought worthy of reproduction:

"I was out walking the other day, when I noticed, among other things, one of those pitiful sights that I am sorry to say are so common in this State—a poor, lone bachelor's cabin. Poor, did I say? He may be rich. Yesterday, perhaps, he picked up a ten-pound nugget. His pocket may be lined with gold. That fifty-vara lot his shanty stands on may be worth a fortune, as fortunes go in this world. Yet see him alone, sweeping his floor, watching his bacon over that fire in the corner, rough and shaggy are his clothes, and a desolate, homeless look haunts his cabin like a genius of evil, the wind moans through his

cracks, the windows are greasy and broken and the spiders weave their dirty webs there—he is poor if that is his wealth.

Further on is a nice little cottage, half-hidden by the fast-growing trees, surrounded by pyramids of bright-tinted flowers that offer their sweetness a free gift to the wind; how grateful their perfume, like incense ascending from the altar of home. As I stood by, admiring, a bright little girl came up and inquired, "should she pick me some flowers?" "One or two, if you please;" and the white-armed little angel flew around through the beds, picking whole handfuls of roses and jessamines and the sweet-scented balm, and with an innocent smile came and offered them over the gate.

I have no comments to make. The two pictures speak for themselves—only this: California's *hopes* are her *homes*. Like her drifting sands the lone ones float away, but her granite hills are not more firm than hearth-stones where the Lares and the Penates are placed. California honors are the bulwarks of the State." IDA.

A Successful Remedy for Vermin on Fowls.

EDITORS AGRICULTURIST:—After reading the close of "Snip's" "Familar Talks," I am inclined to give you a little of my experience with vermin in chicken-houses. I began to keep chickens with the belief that cleanliness was all that was required, and to that end I kept a pot of whitewash always ready, and my nests were coated thick with it, but the pests increased and multiplied. This year I had the nests all taken away, leaving a broad shelf running around the house. On that I put new nests made of five-gallon kerosene cans with the side cut out and pounded smoothly down so as not to be sharp. These can be often cleaned, but my remedy for the vermin is carbolic acid. I tried sulphur, but did not think it was of any use, though I think it is well to feed occasionally during Summer. I use the carbolic acid as it comes for sheep-wash, merely diluting with water. I sprinkle the chicken-house and nests, and once in a while have the roosts brushed over with it, and so far this year I have not been troubled with vermin at all. Perhaps if "Snip" will try this remedy she will be better satisfied, so you can publish this letter if you choose. Respectfully,

MRS. JOSIE P. HILL.

INJURIOUS MANAGEMENT OF DISHES.—A good set of dishes will last for ages, if properly handled. We have heard of an excellent housekeeper whose bridal dishes, thirty years old, are in excellent condition to-day, although they have been in use every week, more or less, during all the time alluded to. In a common dinner service it is a great evil to make the plates too hot, as it invariably cracks the glaze on the surface, if not the plate itself. We all know the result. It comes apart. Nobody broke it. "It was cracked before" or "cracked a long time ago." The fact is, that when the glaze is injured, every time the "things" are washed the water gets to the interior, swells the porous clay, and makes the whole fabric rotten. In this condition they will also absorb grease and when exposed to further heat the grease makes the dishes brown and discolored. If an old, ill-naed dish be made very hot indeed, a teaspoonful of fat will be seen to exude from the minute fissures upon its surface.

THAT nation that loses her liberty is not aware of her misfortune at the time, any more than the patient is who receives a paralytic stroke. He who first tells either of them what has happened is repulsed as a simpleton or a churl.

Domestic.

Domestic Comfort.

BESIDE the fire sat Farmer John,
One blustering winter night;
Beside the farmer sat his wife,
Whose knitting needles bright,
Flew in and out through the woolen socks
Of clouded blue and white.

"'Tis a tedious night!" quoth Farmer John;
"I'm glad I fixed that shed,
It's such a nice place for the sheep—
It shelters every head;
There's not a critter out in the storm,
And everything is fed."

"It is a comfort," said his wife;
"And I am thankful, too,
That I have got those mittens done
For both the boys and you,
And that the girls have good, warm clothes,
From hood to overshoe.

"I wonder what I should have done,
If you had proved to be
A drunken sot, like Jimmy Stone,
Who married Susie Lee;
You know she was the prettiest girl
In all the town of G—.

"Her children sleep to-night in beds
With covering scant and thin,
And through the shingles old and worn
The snow comes sifting in,
While ours are tucked up snug and warm,
From toe to rosy chin."

"You needn't lay it all to me,"
Said John, with loving pride,
"If you had been a shiftless jade,
Like Mary Ann McBride,
Who spends the half her time abroad—
And the other half beside—

"I do not dare to think how sad
Our fate might be to-night;
The children hungry, and half-clad,
Myself a ragged fright,
And everything about the house
In a disordered plight."

And in his heart he blessed the wife
Who had filled his life with cheer—
And she thanked God for the husband true
Who made her home so dear;
And both were glad for the little ones,
In warm beds sleeping near.

A Few Little Things.

My entire household, including the hired girl, is full of satisfaction to-night over the fact that I have just driven the ax-handle firmly into the ax and wedged it there, so that it cannot under any circumstance come out. It may read like a small matter to you, but do you know that that helve had been loose for nearly five years? Yes, for five years that ax has flung itself across the yard whenever I struck a heavy blow, leaving the helve in my hand, and I suppose I have decided more than thousand times to go in and get a hammer and chisel and fasten the helve in. I was thrown and had my arm broken by the ax flying off, two hired girls had their noses broken, we spoiled the stove-boilers, nearly killed three boys, and yet I didn't get around to fix the ax until to-day.

Foster was telling me the other day that he had finally glued that knob on to the bureau drawer, and he seemed greatly relieved. I remember when that knob was knocked off—almost seven years ago. I was helping him move the bureau when the accident occurred, and I never was in the house afterward without hearing Mrs. Foster say:

"Come, Henry, haven't you got time to fix that knob on this evening?"

"Yes, Martha," he would reply, and yet it was seven years before he got at it.

Seven or eight years ago, my neighbor, Mr. Goodwin, found a cow among his cabbages one day, and in driving her out she jumped over the gate and broke one of the hinges. He went in and got a hammer, screw-driver and screws to repair damages, but his wife called him into breaktast just then. After breakfast he hadn't time, and so it ran along until the other day. He passed through the gate an average of five times per day for about seven yeaes, or thirteen thousand times in all, and he had lifted it up, carried it around and bothered for half a minute each time. Thirteen thousand times he said to himself that he would fix that confounded gate, and yet he didn't do it until the other day.

Some twelve or thirteen years ago I was taking dinner with Turner, over on Adams avenue, and his wife called attention to the fact that she had that day broken the handle of her big seven pound flat-iron, and that she must get another. The other day I met her on the street, and she told me she had replaced the flat-iron at last. For thirteen years, fifty-two times per year, she had used that broken handled iron to smooth down her washing, and every time she had said to herself that she would go up town next day and order a new one.

Bristow died last week. We were warm friends, and I was with him to the last. After he had called the family up one by one, and shaken hands and said good-bye, I saw that there was yet something on his mind. I admonished him to trust me if he had a dying request, and he grasped my hand and replied:

"I've been trying to find time for the last seventeen years to take the butcher knife down to the shop and have it ground, and if it wouldn't be asking to much of you, I wish you'd see to it!"

I promised him, but it may be twenty years before I get the knife to the shop, and ten years before I call for it.

I can remember when old Mrs. Bagley died. She had a china teapot in her house which had belonged to her grandmother, but she had always kept it in the drawer because the handle was broken and wanted cementing. She gave the teapot to a neighbor, who waited five years for a bottle of cement, then four years more to find time, and finally knocked the spout off while trying to mend the handle.

I don't suppose any of us would forget the day a note was due, but if the knob should drop off a chamber door, I expect that George Francis Train might be elected President before we would find time to replace it.—*Ex.*

MISMANAGED WORK IN THE KITCHEN.—I think there is more in knowing how to manage than there is in anything else about housekeeping. How many, many housekeepers just spend half their time in mismanaged work, never accomplishing one-half what they might do if they would just do a little thinking and contriving along with their work. Then they wouldn't have to spend so much of their time in fuming and sweating, and in envying others, who they think are more favored than themselves. Now I think I shall tell you right here of one of this kind of workers that I had a chance of observing one morning last November. I entered the kitchen at 8 o'clock, and there were the unwashed breakfast dishes sitting upon the table, and Nora was bending over the stove trying to rekindle the fire that had almost gone out; she succeeded in getting it to burn, and then put her dish water on to heat, sitting down until it got warm enough; washed the dishes, very slovenly about it, or at least it wouldn't have satisfied me to see our dishes put away in that manner. Well, by the time the dishes were all put by, the fire had died out; so, after the sweeping was done the fire was rekindled, and the irons put on in a cold heater, the clothes brought from the room, all unfolded, and piled upon two chairs: the ironing quilt spread upon the wet table where the dishes had just been washed, and then Nora sat down to rest until the irons were hot. Now, if I or any of our family had been doing that morning's work, the clothes would have all been nicely folded away ready for ironing the evening before. Then our water would have been ready for washing the dishes as soon as breakfast was eaten, for we always keep a pot of good, soft water on the back of the stove on purpose for dishwashing, &c., and the fire would not have been allowed to die out, but while we were eating, the iron

heater would have been on the stove getting hot; then, while the dishes were being washed the irons would be heating, and as soon as the sweeping and dusting were through with the ironing would have been completed in one-third the time that Nora's was. I don't see why more women don't think of these things, and try managing right.—*Carrie Lee in Cin. Times.*

Recipes from "Jewell."

CREAM CRISPS.—Take a pint of graham flour and mix with two table spoonsfull sour cream and water enough to make a dough, roll and cut in diamonds, crossing with a knife on top, bake and eat warm or cold—delicious.

HOW TO GET THE SEEDS OUT OF GRAPES WHEN CANNING.—Put your grapes, after washing and pulling from the stems, in a milk pan with a little water, cover, and let them scald when they will burst; then take them off and seating yourself, take a large spoon and stir gentiy and shake up from the bottom, when the seeds will drop out and you can dip with the spoon from the top into another pan, return to the fire and when boiling can.

LADIES FINGERS,—One-half pound of powdered sugar, one-fourth pound of flour, four eggs, whites and yolks beaten separatcly and very stiff. Drop upon buttered writing paper in long narrow cakes, and not too close—bake to a light brown. Try one and if it runs, beat a while longer and add more flour.

KISSES.—Beat the whites of four eggs, add four cups of powdered sugar slowly, season with lemon, dip writing paper in very cold water and drop the mixture on not too close; try one and if not stiff enough, beat a little longer and add more sugar; bake to a light brown.

I will add also the following, selected from my months reading of other journals:

TO COOK MUTTON.—Every week or two we kill a mutton. I roast it all. I put it in the oven in a large bakepan, put it in water, cook till eleven; turn it over twice; everyone who eats a mutton here says it is the best they ever ate. At eleven o'clock take out the mutton, fill the pan full of potatoes and bake them, thicken the gravy, and you need little else for a dinner fit for a—well, anybody. Kings are no better than we are.

TO PRESERVE LEMONS FRESH.—Slice them as thin as possible, and put into a nice sweet jar wfth alternate layers of sugar and lemon; remove all the seeds, have each layer entirely covered with sugar; tie a thick cloth over the jar before putting the cover on, so as to exclude all the air. I have kept them perfectly fresh for a year in this way.

TO BAKE HAM.—Most people boil ham. It is much better baked, if baked right. Soak for an hour in clean water and wipe dry. Next spread it all over with thin butter and then put it in a deep dish with sticks under it to keep it out of the gravy. When it is fully done take off the skin and matters crusted on the flesh side and set away to cool.

FOR SKIRTS, ETC.—Place two ounces of fine white gum arabic powder in a pitcher and pour on it a pint of water; then cover and let it stand all night. In the morning pour it carefully from the dregs into a clean bottle and cork it and keep for use. A teaspoonful of gum water stirred in a pint of starch made in the usual manner, will give to lawns, either white or printed, a look of newness when nothing else can restore them after they are washed.

Boys and Girls.

Four and Twenty Different Birds Baked In a Pie.

[The names of twenty-four birds are found in the following lines:]

An old woman went to the mart in haste
In a scarlet cape, a cocked hat laced,
In her hand a crook; and she said, "Well, I say,
How lucky it is this is market day!"

She had over two miles from her home to speed,
And with awkward steps she went fast, indeed.
"My sons want a pie as large as can be,
And a brave, noble pie they shall have," quoth she.

She, in a panic, ran ever so quickly,
Where the ground with rushes was covered thickly;
So quick, I tell you, she ran that she
Fell in nettles quite up to the knee.

Just where one can a rye-field espy
And through the oak-tree a gleam of blue sky,
There fell the dame—"Bitter nuts, I must say!
Who thought of laming one's self in this way?"

Her heart did throb in dismay and fear,
A fall doth befall conceit, that is clear.
This comes of being roused, for vanity's sake,
To regular kingly party to make.

At length up she scrambled. How rent was her gown!
"Too late, all too late I shall be in the town?
To go, O severely my legs it will try,
Yet a parsnip, eggs, bacon and birds I must buy!"

However, she managed to hobble away,
And for twenty-four birds her money did pay;
In a wonderful pie then the birds she did cook.
You will find all their names in these lines, if you look.

—[Youth's Companion.

Letters From the Young Folks.

Dear Uncle Ben:—Maybe I'm not too old to write to you, though I had much rather the space allotted to the "Boys and Girls" be filled with letters from their own hands. By making your request known among the young folks, two letters have come to hand to be forwarded to you with the promise of more. Think of a boy of twelve receiving twenty dollars a month for five months steady employment, to enable him to assist his widowed mother and her younger children! I promised to see that he received a copy of the paper containing his letter to encourage him in writing again, knowing that improvement to the young folks is your chief aim in inviting their correspondence. Hoping the children in your vicinity are anxious to follow the example so nobly set for them, and that they will continue to swell the column devoted to them to its utmost limits, I am ever your friend and well-wisher, W.

SANTA CRUZ, Sept., 1875.

Dear Uncle Ben:—I am glad that you want all the little children to write to you. I am a little boy twelve years old. I have been working for this Flume camp for five months. There are some very high trestle-works here. The highest place is ninety feet; and there are some very deep cuts in the ground.

I help the cook. I have to cut all the wood that he burns. I and my brother work to get money to support my mother and my other younger brothers stay at home. This is all I can say this time. GEORGE A. NOTLEY.

Dear Uncle Ben:—Mamma says you like to have little girls and boys write to you, so I thought I would tell you about camping out. Sometimes I go paddling in the flume. Sometimes, when other little girls and boys come to see me, we all go paddling in the San Lorenzo creek. My papa works on the Flume. One day we all had a long ride in it; it was nice fun. I like to camp out because I don't have so many dishes to wash. I am nine years old, but I can't write very good because I never went to school only three months. I say my lessons to my mamma now. There is one little girl and three little boys that come to our camp, and mamma hears their lessons, too. My auntie's horse stepped on my foot. At first I thought I was most dead, but it's got most well again. Cant stop to write any more this time. Good-bye. From

MAY E. PERKINS.

FLUME CAMP, near Felton.

Dear Uncle Ben:—I don't know how to write for a paper. I am a country boy now, used to live in town. I like the country now better than when I first left the town. I do not see so many people now, but have got used to it, and think it real nice to learn all about horses, and cows, and pigs and things. I have given a name to every one of them, and they seem to know their names. To me they are all like so many people. They all have different dispositions, too, and are just as much like folks as anybody.

I want to tell you about old Dingy and her calf Spriggy. Spriggy and I have lots of fun running around the corral. Old mother Dingy is between a red and yellow sort of faded out color, but she is a kind old cow and gives rich milk. We never let her calf suck at all, but make it drink. It learned by sucking our fingers in a pail of milk. I milk old Dingy, and she thinks I am her calf. She will moo after me and lick my coat-sleeve when I go to her to milk her. The little bossy, Spriggy, thinks I am his mother! I always feed him now.

I have budded some rose-bushes and they are alive. Next Spring I am going to learn how to graft our orchard. I could tell you lots more about a heap of things. I will be thirteen next month. I go to school seven months in the year, and ride a horse to school. Goodbye. HARRY.

My Dear Uncle Ben:—I thought I would write to let you know how we are getting along. We are all well except my youngest brother, who has the toothache. We had a great time the other night getting a coon out of a tree, but not until he had killed three chickens. My father got the gun and called us up; we held the light and he shot it through the head. This makes three he has killed in the dooryard. The dogs like the fun, after the coons are half dead, to shake them. We have a fine lot of water-melons. They go very good, as we have no other fruit. We received those copy-books the day our school closed. Many thanks from us all. I had thirteen head-marks; the rest had six. We are all going up on the side of a mountain to get a load of fossil shells for our chickens. I wish you were here to go with us. I know you would kill a deer, besides lots of other game. My father is almost ready to start, so I must close. Goodbye for this time. LYMAN ROSS.

LOMPOC, Sept. 6th.

Little Folks' Dictionary.

A writer in the *Schooldday Magazine* has gathered together the following dictionary words, as defined by certain small people here and there:

Back-biter—a flea.
Bed-time—Shut-eye time.
Dust—Mud with the juice all squeezed out.
Fan—A thing to brush the warm off with.
Fins—A fish's wings.
Ice—Water that stayed out in the cold and went to sleep.
Monkey—A very little boy with a tail.
Nest-egg—The egg that the old hen measures by to make new ones,
Pig—A hog's little boy.
Salt—What makes your potatoes taste bad when you don't put it on.
Snoring—Letting off sleep.
Snow—Rain all popped out white.
Stars—The moon's eggs.
Trunk (of an elephant)—His front tail.
Wakefulness—Eyes all the time coming unbuttoned.
A small catechism—Kittenchism.

Hygienic.

Two Ways of Dressing Our Babies.

BY "JEWELL."

Will not here let me describe the clothes given me to put on a new born baby not long ago.

In the first place, the flannel band was hemmed each side and at each end; it had been used before, and having shrunken was thick and stiff. Then a linty thin, fine linen shirt, no sleeves but lace, the same style our grandmothers used ages ago—long enough to go twice about the body—but intended to be folded before and behind. Then a flannel pinning blanket with broad band double, of new cotton cloth, long enough to reach once and a half about the child. Then a flannel skirt with same sort of band, a white skirt, band ditto, and to slip over that a calico double gown, and then a blanket to wrap about the childs head! Now friends, this is no fancy picture as you know. I have dressed scores of infants in the same way, with more or less to put on. Once all they gave me was a blanket, very short, a fine linen shirt, a pinning blanket that did not reach around the body of the child, he being larger than the previous one, and a white nightgown; nothing over the arms or neck but one thickness of cotton cloth, while the body had six thicknesses, and one of them flannel.

In the first case, there were 13 thicknesses of clothing about the abdomen and three over the arms and neck! No wonder our babies cry and worry, making them the laughing stock of the world—and their parents nervous and weary with unnecessary care. By dressing the extremities too thin and the bowels too warm you induce the blood to flow and remain where it is the warmest, acting as a prevalent cause of inflamation of the bowels, a disease quite frequent among infants in consequence of bad clothing to a great degree—what else more likely to give a nursing infant cholera infantum? unless indeed it be the mother taking very improper food and drink while nursing the baby.

And now I will tell you how to make clothes that will dress baby comfortably, and be convenient to put on or off:

First the band (only to be worn the first two months and put on loosely) should *not* be hemmed, and should be made of new flannel. Then a long sleeved, high necked knit shirt, of fine saxon wool—any mother could knit one in less time than she could make one of those gossamer linen shirts—and baby is warm and soft as in down; then a high necked, long sleeved flannel waist buttoned behind or before, and on that a pinning blanket is buttoned or a white petticoat or flannel one if you wish; over all is a flannel slip or night gown.

If it is winter and you have to take baby through draughts, an excellent plan is to have a long sacque of plaid flannel with hood attached, with elastic about face of hood which can be slipped on or off as you need it. The sacque buttoning down the front keeps baby perfectly wrapped, and is very convenient if an older child or husband were to tend baby while you are busy, as they are sure to get all the blankets and fixings on a baby about its head in an honest endeavor to keep it warm.

This latter style of dressing baby gives four thicknesses over the body and three about the arms and neck, which is in right proportion. The arguments in favor of its general use are many and good. First, it is easier made; second, less expensive; third, more easily put on the child; and fourth, is more comfortable and healthful—not one of which will apply to the old style.

Dr. Warren, of Boston, once said that "that city sacrificed 900 babies every year by not clothing their arms. Most of the babies brought to me at the dispensary were improperly clothed. The arms are usually exposed—the legs often, and a thick bandage is frequently tightly drawn around the abdomen. These errors in clothing are almost as bad in their effects as errors in diet—especially in a climate so changeable as the American. The dress should never form a ligature about any portion of the body, since it interrupts circulation and promotes congestion," etc. Dr. Garrish says he always recommends mothers to put soft flannel shirts on their children, summer and winter as a protection against changes of temperature.

Flannel is the best article to put on infants, for if it gets wet it is still warm and comfortable. Don't be afraid of keeping your babies too warm. They thrive best when warm and quiet; but give them plenty of fresh air. They sleep twice as long out of doors under a tree as in a close room in the cradle. Try it.

Mothers, Save Your Children!

BY NELL VAN.

Let any person, who is at all familiar with the laws of health, look around on the girls of America and observe how many of them reach the age of twenty in the full enjoyment of earths richest blessing.

We find among them beauty of complexion, fine eyes and hair; white teeth and slender forms, but robust health is a rarity. Why is it? Can any one account for the fact that the young California Indian girls (Greasers as they are called) who are taken from their semi-barbaric life and transplanted into the household of civilization, in a few years droop and die? Mark the difference between the children of one family in health and activity. The boys live out doors after they step into the pantaloon age. They climb trees, they chase poultry, they shout and expand their lungs. They roll hoop, play ball, and when older they hunt, fish, swim, and altogether enjoy a life of freedom from restraint. Their clothes fit loosely and give full play to all their muscles, besides covering the body and limbs equally. Who ever hears of such boys having cold feet? The girls of the family are found within doors most of the time attending to domestic concerns, sweeping carpets and breathing dust, cooking or breathing the fumes of cooking. Sometimes sewing or playing the piano between the intervals of study.

When they go out they are dressed in the prevailing mode, and the last word from "Mamma" is a reminder to be careful and not tumble the clean dress. In fact, from earliest childhood girls are made sensible of the weight of responsibility imposed by their dress. Then how imperfectly does custom clothe our girls.

I saw a mother making flannel under suits for her little daughter. They were cut low-necked and short-sleeved, with edges scalloped with embroidery silk, and in length they barely covered the trunk, leaving the limbs with only the muslin covering and embroidery ruffles which came to the knee and their met the fine cotton stocking.

Said I, "Mrs. S., do you make her brother's under-flannels like that?"

She replied indignantly, "of course not."

"And why not, pray?" I asked; "are not the boys full as healthy and strong as she? cannot they better endure having the chest, arms and legs unprotected than this delicate child?"

In a ruffled tone my friend argued that if her girl should wear high-necked flannels with long sleeves she would be sure to catch cold when she laid them off to wear low-necked and short-sleeved dresses, as young ladies are apt to do upon occasion. It was to enable her daughter to present a fine appearance, then, at the full-dress party, which prevented the child from being warmly clad. Is this an isolated case? Alas! no. We find such mothers everywhere in America; but we also find good, sensible ones whose girls, as well as boys, wear flannel suits fitting the form comfortably and covering the body from the neck to the wrists and heels, with stockings outside of either wool or cotton, according to the season. These are the children who are not hindered from indulging in out-door sports, nor are they charged with the care of their clothes while at play. Dress them strongly and loosely and let them run and climb, whether girls or boys, and I'll run the risk of their "unsexing themselves," as the saying is—what it may mean I'll leave for those who use the term in regard to the leaders of woman's rights to enlighten us.

How the Eye is Swept and Washed.—For us to be able to see objects clearly and distinctly, it is necessary that the eye should be kept clean. For this purpose it is furnished with a little gland, from which flows a watery fluid (tears) which is spread over the eye by the lid and is afterwards swept off by it, and runs through a hole in the bone to the under surface of the nose, while the warm air, passing over it while breathing, evaporates it. It is remarkable that no such gland can be found in the eyes of fish, as the element in which they live answers the same purpose. If the eye had not been furnished with a liquid to wash it and a lid to sweep it off, things would appear as they do when you look through a dusty glass. Along the edges of the eyelids there are a great number of little tubes or glands, from which flows an oily substance which spreads over the surface of the skin, and thus prevents the edges from being sore or irritated, and it also helps to keep tears within the lid. There are also six little muscles attached to the eye which enable us to move it in every direction; and when we consider the different motions they are capable of giving to the eye, we cannot but admire the goodness of Him who formed them, and thus saved us the trouble of turning our heads every time we wished to view an object.

Removal of Tape-Worm.—A writer says that in treating some cases of tape-worm he has employed no preliminary provisions beyond forbidding the patient to take any breakfast the day on which it is intended to remove the worm, and giving him a large dose of Rochelle salts the preceding night. At 10 o'clock in the morning a dose is given, made of one

half ounce of bark of pomegranate root, one half dram of pumpkin-seed, one dram ethereal extract of male fern, one half dram powdered ergot, two drams powdered gum arabic, and two drops croton oil. The pomegranate bark and pumpkin seed are thoroughly bruised and, with the ergot, boiled in eight ounces of water fifteen minutes, then strained through a coarse cloth. The croton oil is first rubbed up with the acacia and extract of fern, and then formed into an emulsion with the decoction. In each case the worm was expelled alive and entire within two hours. In each case, too, the worm was passed with the head firmly fastened to the side of its body at about the widest part, from which it was with difficulty removed.

THREE EMINENT PHYSICIANS.—As the celebrated French physician, Desmoulins, lay on his deathbed, he was visited and constantly surrounded by the most distinguished medical men of Paris, as well as other prominent citizens of the metropolis. Great were the lamentations of all at the loss about to be sustained by the profession, in the death of one they regarded as its greatest ornament; but Desmoulins spoke cheerfully to his practitioners, assuring them that he had left behind three physicians much greater than himself. Each of the doctors, hoping that his own name would be called, inquired anxiously who was sufficiently illustrious to surpass the immortal Desmoulins. With great distinctness the dying man answered, "They are Water, Exercise and Diet. Call in the service of the first freely, of the second regularly and the third moderately. Follow this advice and you may well dispense with my aid. Living, I could do nothing without them, and dying, I shall not be missed if you make friends of these, my faithful coadjutors."

FOOD AS MEDICINE.—Dr. Hall relates the case of a man who was cured of his biliousness by going without his supper and drinking freely of lemonade. Every morning, says the doctor, this patient arose with a wonderful sense of rest and refreshment, and feeling as though the blood had been literally washed, cleansed and cooled by the lemonade and fast. His theory is, that food can be used as a remedy for many diseases successfully. As an example, he cures spitting of blood by the use of salt; epilepsy by watermelon; kidney affection by celery; poison, olive or sweet oil; erysipelas, pounded cranberries applied to the part affected; hydrophobia, onions, etc. So the way to keep in good health is really to know what to eat—not to know what medicine to take.

DECAY OF THE TEETH.—What time of day do the teeth decay most rapidly?

Ans.—From midnight till the breakfast hour. The meals of the day help to preserve the teeth by friction and the flow of saliva, which, to a great extent cleanses them of decaying matter; and thus it is that the teeth pass through the day and early part of the night without much progress of caries; but after retiring, the remaining particles of acidifying food, the inspissating mucus, the developing fungi, all combine to make the hours toward morning pre-eminently the period of decay. Then it is that the chalk placed between the teeth late at night and allowed to remain there comes to the rescue, and by its antacid reaction, prevents, in great degree that disintegration dependent upon acidity and parasitic growth.

A TRAVELLER on a miserable lean steed was hailed by a Yankee, who was hoeing his pumkins by the roadside—"Hallo! friend," said the farmer, "where are you bound?" "I'm going out to settle in the Western country," replied the other. "Well, get off and straddle this ere pumkinvine, it will grow and cary you faster than that ere beast."

The Dairy.

Kind Treatment Pays.

MR. WILLARD in his new "Butter Book," speaks in the strongest term, in favor of kind treatment of cows kept for the dairy:

It is really astonishing, he says, what a large difference in the yield of milk it makes by attending properly to a number of small things in the management of stock—things which would seem to many quite too insignificant to be worth observing. The dairyman should have a genuine, hearty love for the animals under his control, attending to every detail for their comfort, providing wholesome nutritious food, pure water and pure air—everything of this kind in abundance—keeping the animals properly sheltered from storms; feeding always with great regularity; paying the most marked attention to the manner and time of milking, and, withal, preserving a uniform kindness and gentleness of treatment throughout every operation, a gentleness extended even to the tones of the voice.

Generally speaking, that cow will do her best that is loved the best and petted the most by those who have her in charge. If you wish a cow to do her best, you must cultivate her acquaintance intimately, and be unsparing in little acts of kindness. You may whip and torture a cow into submission, but she will strike the balance against you in the milk pail. One of the greatest faults among dairy farmers to-day is a lack of kindness and consideration to domestic animals. Cows should be petted daily, and be made to feel that man is a friend and protector. All pain, fright and uneasiness checks the secretion of milk, and the man who is passionate and abusive to his herd never did and never can realize a full yield of milk from it. I think that any one who has the charge of animals should study their character and disposition. It is an interesting study, and, under the law of kindness, you will not unfrequently bring out wonderful traits and exhibitions of affection, which will show a forethought and design which may well be ranked with the higher intelligence of reasonable beings."

The Holstein Cow.

The Holstein bred cows are now attracting much attention in various parts of this continent from their wonderful milking qualities. They are natives of the north of Germany, large, heavy cattle, of compact form, making, when fattened, excellent beef, and being also good workers. They have been grown in Holland for generations, with special regard to their milking qualities. In that country, they are invariably black and white; but in their native Duchy they are found of various colors. The quality of the milk of the Holstein is such as fits it well for the cheesemaker, the globules being small and uniform in size. The skim-milk is of a very blue tinge. The butter made from the cream possesses great lasting qualities.

Several instances are on record, and are well authenticated, where cows of this breed have given large quantities of milk. One cow is certified to have yielded an average of 18 quarts a day for 9 months. A heifer owned in Chemung Co., N. Y., gave after her first calf 15 quarts a day for nine months. An instance is also recorded where a Holstein gave 74 lbs., for ten consecutive days, of milk that yielded 22.70 of cream. The record of a heifer belonging to a Stock Breeders Association in N. Y., State shows that, after her first calf she gave for 12 days 40.65 lbs; for the next month, May 43.17 lbs.; in June, 52.18 lbs.; July, 51.57 lbs.; August, 50.12 lbs.; September, 41 lbs.; October, 33.17 lbs.; November, 27.70 lbs.; being an average per day for the 7½ months, of close upon 45 lbs. Her feed was, for the first month, simply hay with 3 pecks of turnips daily, and afterwards pasture and 2 quarts of corn meal. After Oct. 1, 4 quarts of a mixture of oats, corn and shorts, and ¼ bushel of roots were fed. —*Canada Farmer.*

IN butter making, the object sought is the separation of the butter globules from the caseine and other ingredients of the milk; their retention in a pure and perfect state, and their preservation in that state, for use, with the union of no foreign substances, except a small amount of pure salt. In the process of cream rising this seperation commences, and it is highly important that we adopt a method by which, in this stage of the process, it may be made as complete as possible. The conditions of success, are a right and uniform temperature, rest, protection from taints and evaporation, from the destructive influences of the atmosphere, and too intense light.

TO FRESHEN RANCID BUTTER.—Here is a fact worth a years subscription to a paper: "To a pint of water add thirty drops (about half a teaspoonful) of liquid chloride of lime. Wash in this two and a half pounds of rancid butter. When every particle of the butter has come in contact with the water, let it stand an hour or two; then wash the butter well again in pure water. The buttter is then left without any odor, and has the sweetness of fresh butter. These preparations of lime have nothing injurious in them."

Alderneys and Jerseys.

Alderney is well-known for the breed of cows that bears its name. These are so called because the first ones exported were from that island, although now very few that are sold as Alderney cows are directly from that island. Those of that breed actually exported from these islands are generally from Jersey, where the cattle are much the same as those of Alderney—small, with tapering heads and of a delicate fawn-color. The Guernsey is esteemed by some even more highly than the Alderney. It is rather larger and more of a red, brindled in color. The cows are milked three times daily, and the milk is churned without skimming. One pound of butter a day is by no means an uncommon yield for a good cow. The cow cabbage is made to reach a size so large that the leaves are used to wrap the butter in for market, while the stalks are varnished and armed with ferrules, and extensively used at St. Helier's for canes. The cows are carefully coddled. The grass they feed on is highly enriched by the vraic, a species of sea-weed gathered from the reefs at low tide.

There are two vraic harvests appointed by the Government—one in the Spring, the other in August, although it is gathered at other times in small quantities. All hands turn out in the season with boats and carts, frequently at night, and it is a very lively picturesque occupation, though often attended with loss of life from the overloading of boats or sudden rising of the tide. The cows are always tethered when feeding. They eat less in this way, really giving more milk than when glutted with food, and while they are cropping the grass on one side of the field, it has time to spring up on the other side. When they have done eating, they are at once moved from the sun into the shade. The breed is preserved from intermixture with other breeds by strong and arbitrary laws very carefully enforced. No cattle are allowed to enter the islands except for slaughter within a certain number of days, with the exception of oxen for draught.—*Harper's Magazine for June.*

WINTER and spring butter is often very much injured in flavor by allowing cows to eat the litter from horse-stables. Cows are not unfrequently very fond of this litter, though it is impregnated with liquid manure

from the horses, and if allowed they eat it greedily; and the effect is that their milk and butter will be tainted with the taste of this kind of food, in the same way that the flavor is injured by eating turnips, but to a more disagreeable degree. If litter is allowed to be eaten, it should be given to cattle not in milk, and on no account should milch cows be allowed to consume other than the sweetest and purest food. Very nice butter-makers are sometimes at a loss to account for stable taints in butter, especially when extraordinary precautions have been taken to have the milking done in the most perfect manner, and so on in all the processes of handling the milk until the butter is packed for market. Still, the butter has a disagreeable taint, and the cause often comes from allowing the cows, when turned out to water and exercise, to feed about the horse-stable, where they consume all the litter which, on account of its being soaked with liquid manure, is cast out of the stable.—*Rural New Yorker.*

Butter Product of a Short-Horn Heifer.—In looking over your paper from week to week auy one would suppose that the Jersey cows were ahead of all other breeds in the State for making butter. I think it is a great error. I think there are other breeds that will make more butter on less provender and give more milk than the Jerseys, and make butter of as good quality. I have a thoroughbred Short-horn cow, four years old last March, that made in one week last January eleven and three-fourths pounds of as nice butter as was ever produced by a Jersey cow. It was but seven minutes churning by the clock. Her feed was but four quarts of shorts per day, and as much good hay as she would eat. If any one has a Jersey heifer three years old or past that will beat this I would like to purchase her.—*M. L. Wilder in Maine Farmer.*

High Farming in England and its Results.—At the monthly Farmers' Club meeting, held during the Smithfield show week, in London, the *Canada Farmer* says, the subject under discussion being, "The Future of Farming," Alderman Mechi said, that on his own farm, and many others which he could name, the amount of produce was such that he was convinced that if the whole of the land of England was farmed as it ought to be taking the present rate of consumption, not one-half of the produce could be consumed, supposing there were no foreign importation whatever. At which the farmers present laughed immoderately. The alderman continued and said he could produce plenty of men connected with Norfolk and Lincolnshire who would bear out that statement. "If the farmers of England, as a body, produced what was produced by some of the farmers of those two counties, the people of this country would not, at the present rate of consumption, consume one-half of the total, without any foreign importation." The report does not state whether the laughter was repeated.

Studying Latin.—A good story is told of an old farmer whose son had for a long time been ostensibly studying Latin in a popular academy. The farmer not being perfectly satisfied with the course and conduct of the young hopeful, recalled him from school, and placing him by the side of a cart one day, thus addressed him: "Now, Joseph, here is a fork and there is a heap of manure and a cart; what do you call them in Latin?"

"Forkibus, cartibus, et manuribus," said Joseph.

"Well, now," said the old man, "if you don't take that forkibus pretty quickibus, and pitch that manuribus into that cartibus, I'll break your cussed lazy backibus." Joseph went to workibus forthwithibus.

Fowls moult in August and September. Then take good care of them.

The Horse.

Something About Draft Horses.

A CORRESPONDENT of the *National Live Stock Journal* gives a little history of draft horses in Ills., that must be encouraging to breeders of such stock elsewhere:

The race horse is the gentleman among horses, and the draft horse the laborer. (The laborer makes the money, and the gentleman spends it.) We found that our horses were too near all so-called gentleman horses, and we had too few laboring horses, and that the business of the country demanded stronger draft horses.

In about the year 1843, Col. Oakley imported *Sampson*, a large draft horse of English or Belgian stock, into Central Illinois (Tazewell county.) *Sampson* was a very large, logy draft horse, weighing from twenty to twenty-two hundred pounds. He was so large, that it was with difficulty that the farmers could persuade themselves to risk the extreme cross on their small mares; but they did risk it, and his stock was disseminated largely all through that part of the State, and proved a great success. Before the stock of the imp. *Sampson* was lost sight of, the imp. *Louis Napoleon*, a draft horse of Norman or French blood, made his appearance in the same locality (Tazewell county), in about the year 1855. He gained a large reputation as a stock horse, and he and his descendants were used largely for a number of years in the different counties of Tazewell, Woodford, McLean and LaSalle. The stock of *Louis Napoleon* proved of such excellence that it opened up an active trade, not only in this country, but even in France, England, Scotland and Belgium, and within the past six years caused the importation of hundreds of draft horses from the above-named countries into the State of Illinois alone, placing this State second to no other State in the Union in valuable horses, either for the farm or the markets. We have more than once heard the remark made in Chicago, "Why do the Eastern horse dealers always make such a bee line for Ottawa" (Ills.)? Why because old *Louis Napoleon* made his appearance in La Salle county in the year 1859. The different strains of draft horses that have gained such favor with the public, have stood purely on their own merits; their dissemination is not due to any advice or influence given through agricultural papers. Neither did the agricultural fairs show them favor, until their own merits first placed them highly in favor with the public. The more popular strains of draft horses now so rapidly importing into Illinois and other States are the Norman or French horse, the Scotch Clyde, the English draft, and the Belgian; the Norman or French largely predominating in numbers.

It would seem that the necessary weight in the draft horse has been reached. The weight of eighteen to twenty hundred pounds has become more the rule than the exception among the draft horses now being imported into this country. The draft horse is already bred up to a high state of perfection, yet we can further improve them by carefully and judiciously breeding for more action, with a more combined muscular power and beauty of style.

Colors and Qualities.—I find horses of dark chestnut, true bay and dark brown colors, to be more free from disease than those of other shades, and I hold them up in the front rank for the general qualifications of speed, stamina, docility, size and beauty of conformation. Color itself does not make the difference, but it is caused by the peculiar organization which makes these colors. Among the light chestnuts—erroneously called sorrels—are to be found nine-tenths of skittish, balky horses and those with other unpleasant qualities so much feared and objected to. Black horses have more faulty eyes and feet than other colors, according to my observations. The various dapple-greys are much more liable to warts than horses of other colors.

Still I have seen in horses of all colors qualities to be admired and to be rejected. Among the "buckskins," the various shades of cream, and the spotted, we often find powers of endurance, and sometimes speed, which are somewhat astonishing. These shades are not fashionable, however, and therefore not marketable. Still the old saying is true: "A good horse is seldom of a bad color," I still adhere to my former opinion, that the dark chestnut, true bay and dark brown are the colors to perpetuate in breeding, as in them we have all the requisites of endurance, speed, size, docility and fashion, which fill the whole bill as to our needs or requirements in a horse. *W. Horne, Country Gentleman.*

What To Do With a Dead Horse.—Several agricultural papers recommend cutting up and converting into manure by covering with lime and earth. But it is our opinion that feeding the flesh to chickens is the most profitable way of disposing of dead horses, dead cattle etc. What is not needed at once or while it can be kept fresh for the purpose, should be cut into strips and dried. In this condition it can be stored away in sacks; and a little of it chopped fine every day or two will do much towards increasing the egg product. A fair sized horse is worth $5 to $10 for this purpose, besides trouble of hauling and cutting up, drying, etc.

Agriculture at the Centennial.

The value of the farms and farm machinery, the farm products, and the live stock of the United States, roll up an aggregate of over thirteen thousand million dollars, while the total of the products of our manufactories (less the materials employed) and the capital invested in them is less than four thousand million dollars. To fitly present characteristic specimens, drawn from and fully illustrating this enormous industry of our land, is the duty that devolves upon the agricultural department of the Centennial. The representatives of the ninety million of horses, cattle, sheep and swine noted in the census of 1870, will alone constitute such a grand display as will be worthy of attention; and it might be well to mention just here that one club proposes to exhibit three hundred specimens of neat cattle. The attractiveness of the agricultural exhibit and the disposition to contribute to it, will be recognized when we state that, out of the 12,500,000 persons engaged in all classes of occupations in the United States, 5,922,000, or nearly one-half, are engaged in agriculture.

The trades and industries, too, that minister and are subordinate to the agricultural interests of our country, swell the aggregate seeking space for display in the area set apart for this department. With these few figures, (drawn from the census of 1870) in mind, we may imagine how great a proportion of the visitors will be attracted to the farmers' show the Centennial Exhibition be peculiarly attractive to our own citizens, but, as we are best known abroad by our agricultural productions, so we may anticipate that of the foreigners who visit us in 1876, the specialty which will call the greatest number of them to Philadelphia will be the agricultural.—*Philadelphia Press.*

The New Haven *Register* says: "Henry Bassett, of Hamden, to-day exhibited at our office an egg, laid on his farm by a Cochin Partridge hen measuring 13 inches in circumference and 8 in diameter."

Apiary.

Thou Cheerful Bee.

THOU cheerful bee I come, freely come,
And travel round my woodbine bower;
Delight me with thy wand'ring hum,
And rouse me from my musing hour.
Oh! try no more those tedious fields,
My honied treasures all are thine;
Come taste the sweets my garden yields,
The bud, the blossom, all are thine.

—[Smyth.

Bee Keeping in Southern California.

From the *American Bee Journal* we extract two letters upon bee keeping in California by persons who evidently view the business and country from different tempraments. The first letter is by J. W. Sallie, Anaheim.

Dear Bee Journal:—In my last I promised to tell the "bee men" something of Southern California. First, then, as to

CLIMATE

I do not suppose that there is a better climate on earth than that of Southern California, especially that portion west of the mountains. Such is a large portion of Los Angelos county, it being a beautiful valley, about twenty miles wide and seventy-five long, with a slope of about twelve feet to the mile, from the mountains to the beach. This valley, being west of the mountains, is free from the bleak winds of the desert, and the cold winds from the north, with a regular sea breeze every day, rendering the climate more even than that of Spain, France or Italy; the mercury seldom going above eighty degrees, and rarely below forty degrees. Near the coast it is cooler; but as you approach the mountains, the climate grows warmer, at the rate of about one degree per mile. Near the coast it is too damp and cool for consumptives—but on the west side of the mountain, at an altitude of 1,500 or 2,000 feet, you are above the *fogs* and dampness—and the climate is *just splendid*. There is never any frost at this altitude, on the west side of the mountains—and here is where the bees do so well. In point of

SOIL,

this valley is equal to any portion of the United States. The soil is made by deposits from the mountains, and is inexhaustible, There is, however, only a small portion of it that is susceptible of cultivation without irrigation; this is supplied by water from the mountains, and by artesian wells. These can be had at a cost ranging from $125 to $500. This seems almost incredible to an eastern man, but such is the fact. Many poor farmers, just starting, have their artesian wells, giving an abundant flow, for irrigating their quarter section of land. As to

FRUIT,

there is no end to it here. Almost every variety of semi-tropical fruits grows to perfection here; and the flavor of all kinds of fruits is especially excellent, on the high "masa" lands. Peaches are never a failure; apricots, nectarines, plums, pears, etc., etc., in endless varieties, strawberries the year round, while tomato vines bear continuously, for five or six years. Vegetables without end, and the grape to perfection. Raisins made by the ton, simply by pulling the grapes from the vine and spreading them on the ground to dry.

This valley land is especially adapted to the cultivation and growth of the Alfalfa, or Chili clover, which will feed from four to six cows per acre, the year round, producing a large yield of good milk and butter.

BEES

are also kept in the valley; but the quality of honey is very indifferent, and consequently it is not considered very profitable. Yet bees will increase equally as fast in the valley as on the mountains. The most desirable locality for bees is directly up the side of the mountains, about one mile from the valley, and at an altitude of 1,500 feet, with plenty of sage, sumach, etc., about you, on the mountains. The bees go to the valley first in the spring, and as the season advances, they ascend the mountains, thereby securing a perpetual pasturage.

Bees, *they say*, have not done well this spring, and summer, owing to a frost that fell in April. I took charge of

MY APIARY

on the 5th of May. The bees were all in box hives. I proceeded at once to transfer, which I accomplished in about four weeks; took about 5,000 lbs., in transfering; have all of my hives full of comb, and have taken with the extractor, up to the present date, (July 1st) about 4,8000 lbs. The season is now in full blast, and will continue so for six or eight weeks longer. I have no fears but I will reach 30,000 lbs., from the 150 hives I started with, beside an increase—after "honey for market" is out—of about 300 per cent.

And now, Mr. Editor and brethren, let me say to you all that I have at last found the "place for bees," and I shall not neglect to improve *my* opportunity. So you had better "look well to *your* laurels."

There are other places here, not yet occupied, which would make good bee ranches. But the better plan is to buy out a "squatter," and bring with you about 100 stands of bees to start with. The bees would cost about $1,000, and the 160 acres—with twenty to forty acres tillable land, and a small shanty—about $500. If any "Bee man" wants such a location, etc., I think I could secure it for him for that amount.

There are many points which I would like to talk upon, but must wait till next time.

—

The following letter is from San Diego, name not given:

I came here from Kansas in May, to go to bee-keeping, but found I was four months too late to do anything this year, as bees swarm here in March and April, and from that time to September 1st, are making box honey, and but few are for sale, except from October to January.

They had a hard frost here in April, which stopped swarming, and cut the honey crop very short.

Italian queen-raising might pay, but I think it doubtful, as one-fourth are now Italians. You could not find a location, in my judgment, out of reach of blacks or hybrids, as the mountains have many wild bees in them and the bee-men are already located all over the honey region.

Bee-men complain of losing one-third of their queens in fertilizing this year. Do not think that queens will be sold very profitably. This country wants to be seen to be appreciated—it is not all that fancy paints it. I am very much disappointed and do not think I shall stay, as I left my family East; and if I bring them, they will have to stay here in San Diego, while I go alone up among the mountains, twenty-five to forty miles to the bee-range.

There are no *thriving villages* within a hundred miles from here. This is the *only* village for one hundred miles in *any* direction, and this is as *dead* as can be—always like Sunday in the streets.

Outside of this town there are no churches, and no society you or your daughter would want. Little houses, 15x20 or less, three to six miles apart, with one or two *men* in each, constitute the population, and thus the country is dreary and uninviting. There will be plenty of bees and ranches for sale this fall. Bees in Harbison or Langstroth hives sell at about $10; in box-hives, $3 to $5. Harbison's average, for five years past, is 83 lbs., comb honey—more than most get. This year they will not get half that. They do not know what *extracted* honey is here. I brought two extractors with me, but as *strained* honey is only five to six cents per pound, they will not give me any work extracting.

If you are determined to come, my advice is, stop at Los Angelos, and go ninety miles south of the railroad toward San Bernardino.

Land there, good for fruit, etc., is high; but there you can raise something that way. by irrigating, while in this country you can't raise anything but *cactuses* one year in five.

Harbison gives his men $20 a month, the first year; $40 per month, the second year, and an interest the third year. Do not know the interest.

You might buy 100 hives, bees and ranch, with a shanty, worth $50, for $2,000. I think no one ought to come with less than $3,000, gold, for the first year's work. You might obtain employment—I can't, and dozens of others of us are here doing nothing; can't get work for our board at anything—though I profess to understand the bee business.

I think this whole business overdrawn. Because last year was a splendid success, they thought to make their fortunes; but this year most are losing money.

Preparation of Wax.

Having employed the bees to extract every particle of honey from the combs, put the latter in a clean boiler with some soft water; simmer over a clear fire until they are melted; pour a quart or so into a canvas bag, wide at the top and tapering downwards like a jelly-bag; hold this over a tub of cold water; the boiling liquor will immediately pass away, leaving the liquefied wax and the dross in the bag; have ready a piece of smooth board, of such a length that one end may rest at the bottom of the tub and the other end at its top; upon this inclined plane lay your reeking bag, but not so as to touch the cold water; then, by compressing the bag with any convenient roller, the wax will ooze through and run down the board into the cold water, on the surface of which it will set in thin flakes; empty the dross out of the bag and replenish it with the boiling wax, and proceed as before until all has been pressed. When finished, collect the wax from the surface of the cold water, put it into a clean saucepan with very little water, melt it carefully over a slow fire, skim off the dross as it rises, then pour it into moulds or shapes, and place them where they will cool slowly. The wax may be rendered still more pure by a second melting and moulding, and may be bleached by running it into thin ribands and exposing these to the bleaching action of a grass plat for several days and nights, taking care the sun is not allowed to melt them.—*Manual of Bee-Keeping by John Hunter.*

Bees, Wasps and Grapes.

Some persons imagine that bees injure fruits, and especially grapes. They are greatly in error. It is useful to compare the part taken by bees and hornets in the injury done to our vineyards. First let us consult the books. I do not find a single book on agriculture, fruit or grape culture that does not cite the wasp among noxious insects that should be fought incessantly and mercilessly; while not a single book mentions as such the industrious honey-bee, whose vindicator I now am.

The wasp pierces the fruits; to the grapes it leaves nothing but the skin and seeds. The bee only profits by those spoils; for she usually goes from blossom to blossom, gathering honey in gardens and fields. If at times she is seen in orchards or vineyards, where she only goes after the wasps, it is only to gather the remains of the feast.

Curious experiments have been tried, it appears: Some sound fruits were placed simultaneously within the reach of both wasps and bees; the former have soon achieved

their work of destruction, while the latter starved to death.

Therefore, bees do not eat grapes. So it is with sound conviction that I say to those who wish, if not to prohibit, at least to render impossible the establishment of hives in the neighborhood of large cities, under the fallacious pretext that they destroy grapes: Respect the bee, since she respects our fruits; let her live in peace near us; she never will be ungrateful. Is she not the mysterious instrument that helps and facilitates the phenomenon of fertilization of flowers, and perhaps produces those innumerable and beautiful varieties by carrying pollen from the calycle of one into that of another? Is she not the living image of work, that gives us the perfumed honey and the wax that we use so diversely?—*Mo. Farmer.*

Preservation of Wood.

M. Lostal, railway contractor, has communicated to the Society of Mineral Industry at St. Etienne the results of his observations on the effect of lime in preserving wood, and his method of applying it. He piles the planks in a tank, and puts over all a layer of quicklime, which is gradually slacked with water. Timber for mines requires about a week to become thoroughly impregnated, and other wood more or less time, according to its thickness. The wood acquires remarkable consistency and hardness, and, it is said, will never rot. Wood has been prepared in this manner for several mines, so that the plan will shortly be tested on a considerable scale. Beech-wood has been prepared in this way for hammers and other tools for several ironworks, and it is said to become as hard as oak without losing its elasticity or toughness, and to last much longer than when unprepared. It has long been known that wood set in lime or mortar is preserved from decay, but no systematic plan for its preservation has until now been attempted.

The *Iron. Telegraph* says: We note that the old controversy about tarring or painting shingles and fences, is being revived again, on the principle we suppose that as an old generation passes away the new one wants to learn wholly for itself what it wants to know. It ought, however, to be generally known by this time that not moisture only, but heat and moisture, either or both, are the agents in the decay of woody matter. Most writers seem to think it is moisture alone, and hence all that is required is to coat the wood with some substance that will keep the water out. To be sure they know that heat, when it is up to what we know as the burning point, will destroy wood, but they seem to forget that even when not burning heat is destructive only in a less degree. Any black substance therefore, which attracts heat, though it may keep out the other destructive element, water, adds to the destructive agencies at work on the wood, and should be avoided wherever duration is an object.

It needs no understanding of these laws, however, to know that tar or any black substance tends to rot wood away much faster than wood that has had nothing at all done to it. A fence tarred and exposed to the full sun, as any observer knows, soon crumbles away. In a few years the wood is like an overdone pie crust. And then all know how long a mere whitewashed fence lasts. Yet there is no preservative character of much account in lime. Every rain goes through it into the wood, but it is the white color, which rather turns away the heat than attracts it, which is in that case the great agent which preserves it so long.

In all discussions as to the preservation of wood by paints or coatings, therefore, we see that the color of the washes or paints is an important point in the argument. As for tar, it is the very worst thing that could be used where there is exposure to the sun. Under ground, or where there is no heat for it to attract of consequence, it is another matter, and does possess more or less preservative power.

Poultry Yard.

Fattening Chickens.

It is hopeless to attempt to fatten chickens while they are at liberty. They must be put up in a proper coop, and this, like most other appurtenances, need not be expensive. To fatten twelve fowls, a coop may be three feet long, eighteen inches high and eighteen inches deep, made entirely of bars. No part solid—neither top, sides nor bottom. Discretion must be used, according to the size of the chickens put up. They do not want any room, indeed, the closer they are the better, provided they can all stand up at the same time. Care must be taken to put up such as have been accustomed to be together, or they will fight. If one is quarrelsome, it is better to remove it at once, as, like other bad examples, it soon finds imitators. Diseased chickens should never be put up.

The food should be ground oats, and may either be put up in a trough or on a flat board running along the front of the coop. It may be mixed with water and milk, the latter is the better. It should be well soaked, forming a pulp as loose as can be, provided it does not run off the board. They must be well fed three or four times a day, the first time as soon after daybreak as may be possible or convenient, and then at intervals of four hours. Each meal should be as much as they can eat up clean, and no more; when they have done feeding, the board should be wiped up and some gravel spread. It causes them to feed and thrive.

After a fortnight of this treatment you will have good, fat fowls. If, however, there are but five or six fowls to be fatted, they must not have as much room as though there were a dozen. Nothing is easier than to allow them the proper space, as it is only necessary to have two or three pieces of wood to pass between the bars and form a partition. This may also serve when fowls are up at different degrees of fatness. This requires attention, or fowls will not keep fat and healthy. As soon as the fowl is sufficiently fatted, it must be killed; otherwise it will not get fatter but will lose flesh. If fowls are intended for the market, of course they are, or may be fatted at once; but if for home consumption, it is better to put them up at such intervals as will suit the time when they will be required for the table.

When the time arrives for killing, whether they are meant for market or otherwise, they should be fasted without food or water for twelve or fifteen hours. This enables them to keep for some time after being killed, even in hot weather.—*Journal of Chemistry.*

Hens Eating Eggs—A Cure.—A correspondent of the *Poultry Bulletin* says: "Having seen a question asked how to cure hens from eating eggs, and having been put to my wits end to devise some means to stop them, I finally by accident hit upon a plan that I have never known to fail. One great trouble with many breeders is, they make their hens' nests too large, and with Brahmas and Cochins the nests are near the ground, and in many cases the eggs are in view of the hen. This was the case with my nests. Having tried every available stuff, such as pepper, mustard, turpentine, and every thing I could hear of, but no cure. I then took a common nail-keg, cut it in two or a piece about eight inches high, and placed it in the box where the hens laid. I then put in an egg; the old hen mounted the nest or keg and tried to reach the egg, standing on the edge of the keg, but it was no go; she then got down in the keg, but that was a failure, for she did not have room to get at the egg; after trying for some time she gave it up as a bad job. I have never had an egg eaten by the hens since then; all of the nests in my coops have a piece of a keg in the box, and have parts of kegs for nests. Do not make them too deep, but deep enough so that the hen cannot reach the bottom when standing on the edge of the keg. You that are troubled with hens eating their eggs, try the plan; it costs but little, and I think you will never regret the trouble it will be to outwit the old hen."

Vermin on Fowls.—There are at least three different kinds of lice which infest poultry and their quarters. (We do not now include the *acarus*, that produces what is known as "poultry itch" and "scabby or scurvy legs," etc.) There is the large louse found for the most part in the heads of young chicks. This is quite destructive to the broods, and by some is supposed to be the parent of the gape worm. Whether this supposition is true or not this louse will certainly destroy young chicks unless it is removed and the broods protected from its attacks. Then there is the common body louse, found mostly under the wings and the more inaccessible parts of the skin. These are, perhaps, the least noxious of any of the different kinds; but they evidently annoy the fowls and should not be allowed to remain on them.

The third class of lice is the small red "mite," found only in the house or roosting places and nests. These are, perhaps, the most annoying and troublesome to the fowls of all, and are more numerous than either of the other kinds. They may be found in nearly all roosts and houses that have been used by fowls one or more years where especial care has not been exercised to exterminate them. They stay in crevices on the roosts or walls and nests-boxes during the day and creep upon the fowls and feed at night. They are seldom found on the fowls during the day, except on sitting hens. These are the ones that are so annoying to the brooding hens, forcing them to abandon their nests. They are sometimes found in great numbers in neglected quarters.—*N. Y. Herald.*

How to Feed Fowls.—Fowls are not fed merely for the sake of keeping them alive and healthy on the least possible amount of food. We wish to convert the food into flesh or into eggs. In feeding for quick fattening, it is understood that the poultry should be made to eat as much as possible. My rule for feeding is to throw out the feed once a day, and let them eat as much as they want, and no more. I want the fowls to eat all they will; the more they eat, within reasonable bounds, the more eggs they will lay, and the better condition they will be in. Laying fowls should take exercise, but if they can go to a trough and eat any time they wish, they will take next to none. If fed but once a day, they will wander and hunt insects much more. If fed soft feed, such as wheat bran alone or mixed with milk, they will be hungry again in two or three hours, and be off after insects, &c.

Shrinkage of Fruit in Drying.—In the letter from Charles Alden (owner of the fruit-drying machinery) which was read before the late horticultural meeting at Rochester, New York, he states that a bushel of apples weighs fifty pounds; that the cost of cutting and preparing a bushel for drying is about fifty cents; and that a bushel will yield nine dried pounds, two pounds of which are cores and skins, which, when dried, find a ready market at six cents per pound for making jelly without sugar or boiling—a new product. One bushel gives seven pounds of good dried apples, which will sell regularly at twenty cents per pound; making after drying, $1.25 per bushel of apples, with cores and parings. It will be understood that these dried apples are greatly superior to common dried apples, made by exposure to weather, flies, etc. Tomatoes, being very watery, yield only three pounds dried per bushel, but two dried ounces are found to be equal in substance to a one quart can, and will make as much by adding one quart of cold water and stewing properly. The evaporated tomatoes sell for seventy-five cents per pound. Peaches yield seven pounds from a bushel, one of which is skins.

Horticulture.

Plant Olive Trees.

THERE is no risk in planting olive trees in the southern part of our State, for there they have grown luxuriantly and borne fruit abundantly for nearly a hundred years. The fine olives of the church gardens in San Luis Obispo have yielded fruit since 1782. The olive orchards of San Diego, San Fernando, San Buenaventura and Santa Barbara, have all flourished and given forth their exquisite berries for nearly the same length of time. Thus it will be seen that there is no experimental risk in trying to grow olive trees almost anywhere in Southern California; and we have seen them doing nicely on the foothills of Monterey, Santa Cruz, Santa Clara, Alameda, Contra Costa, Tuolumne, Calaveras and Amador counties, and believe that they will succeed well in parts of forty out of the fifty-three counties in our State, at a certain height on the hills, so as to come within what is termed the warm belt. It is a tree that can be easily raised in this climate, requiring but little or no irrigation, and once it has taken root, will grow with about as little care as any of the ornamental sorts of trees planted on this coast. And there are but few trees more beautiful to the eye than the olive after it commences bearing. Its oblong, lance-shaped leaves, with their deep green shade on top and light feathery color underneath, when disturbed by the gentle winds produce a peculiar and pleasing effect. The trees grow to the height of from thirty to forty feet and its branches spread laterally in every direction, with an erect, jaunty form, making a very inviting shade-tree for roadways and dwellings accompanied with the substantial advantage of bearing fruit that will pay for the cultivation.—*Pacific Grocer.*

Tamarind.

This beautiful tree is a native of the East Indies, but is now considerably cultivated in warm climates elsewhere. Only one species seems to be known—a spreading tree, thirty or forty feet high, with alternate pinnate leaves, which have from twelve to fifteen pairs of small leaflets, and fragrant flowers with three petals, the pods brown and many-seeded, as thick as a man's finger and about six inches long. The pods are filled with a pleasant, acidulous, sweet, reddish-black pulp. They are usually preserved by putting hot syrup on the ripe pulp, but a better method is to put alternate layers of tamarinds and sugar in a stone jar, the color and taste being thus more like those of the fresh pulp.

The wood of the tamarind tree, and especially, of its roots, is a cabinet wood of much beauty but of extreme hardness, so that it is wrought with much difficulty.

On chemical analysis, the pulp is found to contain citric, tartaric and malic acids, potash, sugar, vegetable jelly, etc.

As salt of copper is a common adulteration, a piece of polished iron—a knife for example—should be plunged into the pulp and left in it for an hour, when, if copper be present, it will be deposited on the iron.

The pulp is cooling and gently laxative, and is often employed in febrile complaints. It is used in India as a soothing article of diet, and a kind of sherbet is made from it. It is also an excellent addition to curries.

Tamarind tea is made by infusing them in boiling water; when cold it forms an agreeable and cooling drink in inflammatory and febrile disorders.

Whey is prepared by boiling an ounce of tamarinds with a pint of new milk, and straining. This also is an excellent drink in similar cases.

Oranges and Lemons.—Orange and lemon plantations, in the Mediterranean countries, are called gardens and vary in size, the smallest containing only a small number of trees, and the largest many thousands. The fruit is gathered in baskets similar to peach baskets, lined with canvas, the basket being held by a strap attached and passed around the neck or shoulders. From the garden the fruit goes to the repacking magazine, where it is removed from the boxes in which it was packed in the gardens, and repacked for shipment by experienced female packers, after having been carefully assorted by women and wrapped in separate papers by young girls. As many as five hundred persons, mostly women and children, are employed by some of the fruit-growers in their gardens and magazines in gathering, sorting and repacking for shipment, the wages paid them varying from nine to sixteen cents a day. A full-grown orange tree yields from five hundred to two thousand fruit annually, and arrives at the bearing state in three or five years, as does the lemon tree. In sorting, every fruit that wants a stem is rejected. The boxes are then securely covered, strapped and marked with the brand of the grower, when they are ready for shipment. Twenty years ago this trade was nothing in its commercial characteristics, or the inducements it offered to capitalists. Now it is progressing with giant strides into prominence, and is a considerable source of revenue to the Government.

Mushrooms.—In the whole range of garden crops there is not one of easier cultivation or more certain product. To grow these fungi on a small scale for family use, procure two cartloads of good, fresh stable manure and shake out the longest straw, then turn it over in the open air two or three times to get rid of the rank steam. When this is done take the dung into any shed or outhouse, and mix with it thoroughly about four barrowfuls of ordinary fresh soil. The bed is then to be made up on the floor of the shed or room to the depth of about twelve inches, pressed rather firmly, and spawned when at a temperature of between 75 and 80 degrees. A covering of about one inch of good strong loam in rather a rough state is then added and beaten level with a spade. By using heavy loam as a covering, the mushrooms produced are of a much more solid character than when light, sifted soil is used. They are consequently more valuable, commanding a much higher price in the market. The whole is then covered up with at least nine inches of straw or long litter.

Here, in a nutshell, is the whole secret of growing this most delicious of esculents. We know a lady near Baltimore, who, by the above process, not only supplied her own table with mushrooms, but had enough to spare to bring her the snug sum of $1,500.—*Turf, Field and Farm.*

To distinguish mushrooms from toadstools: 1. Sprinkle a little salt on the spongy part or gills of the sample to be tried. If they turn yellow they are poisonous, if black they are wholesome. Allow the salt to act before you decide the question. 2. False mushrooms have a warty cap or else fragments of ments of membrane adhering to the upper surface, are heavy, and emerge from a vulva or bag; they grow in tuft or clusters in woods, on the stumps of trees, etc., whereas the true mushrooms grow in pastures. 3. False mushrooms have an astringent, styptic and disagreeable taste. 4. When cut they turn blue. 5. They are moist on the surface, and generally—6. Of a rose or orange color. 7. The gills of a true mushroom are of a pinky red, changing to a liver color. 8. The flesh is white. 9. The stem is white, solid and cylindrical.—*Ohio Farmer.*

People who must draw the line somewhere—anglers.

Pisciculture.

Fish Culture.

MR. TENNYSON'S allusion to the slow movement of science from point to point is very true in general, for by the time we are reaping the benefits of an improvement we often forget its inauguration. The progress of fish culture, however, is a notable exception. It is only a very few years since it was thought of in reference to our own waters, and the actual adoption of public measures to that end is still fresher in our memories. The result is already evident to every one in this vicinity who has occasion to pay market bills; and in all the States where efficient commissions have been appointed, for two or three years a like increase in the supply of fish and decrease in the prices is noted. Indeed, the fishermen and dealers are in some quarters grumbling because they have to take and sell more fish in order to make their accustomed profit; but they will not be apt to arouse much sympathy in the public heart on that account. In the Hudson River, this spring, the shad are very abundant and of excellent quality. As some five million artificially hatched young ones are set free every year, and the catch can not, under existing conditions, much exceed a third of that number, the prospect is that we shall see a still further increase. Probably it would be well for us, as a people, if we ate more fish and less meat, and as our waters are adapted for the cultivation of a score or two of species, we should not lack a varied bill of fare. Then, too, there is the moral effect upon the rising generation. What small boy, not abnormally developed in the back of his head, will not prefer to go a fishing, with a fair chance of good luck, to engaging in the mischievous pursuits now so common to his kind? We regard the black bass recently introduced in our inland lakes and streams as potent missionary agents for the reclamation of youthful criminals. If Jesse Pomeroy had been able to keep his mother's table supplied with fish, perhaps he would not have been the murderer that he is. —*Gro. and Prov. Review.*

Fish Interchange.—Prof. Baird, United States fish commissioner, has received a consignment of live fish from the Danube. They were four weeks on the way. Of the three hundred shipped only 27 were received alive. They have been sent to Mr. Hessel, one of the Maryland fish commissioners. Seven of them are carp, eight gold tench, and eleven common tench. Mr. Hessel expects at least 2,000,000 eggs from these specimens this season. In return for the courtesy, Prof. Baird has sent to Germany 100,000 shad eggs. The eggs will be sent on flannel trays, arranged in a case, the cloth being kept moist by dripping water. This arrangement is the patent of N. W. Clark, a Michigan pisciculturist. The hatching of the eggs cannot be retarded more than five or six days, and they will then be transferred for hatching to water in patent cans, by the two persons whom Prof. Baird has selected to take the shad to Europe. After landing to Bremen the young fish will be carried to the river Weser, where they will be put as far as possible from the mouth of the stream.—*Prairie Farmer.*

Very Singular.—"A curious method of fish hatching is said to be followed in China. Having collected the necessary spawn from the water's edge, the fisherman places a certain quantity in an empty hen's egg, which is sealed up with wax, and put under a setting hen. After some days they break the egg, and empty the fry into water well warmed by the sun, and there nurse them until they are sufficiently strong to be turned into a lake or river."

This is certainly a curious mode, and we

will add that when the young fish begin to feed, they come out of the water at the call of a hen, when she finds a grain of corn or a worm; and after their return from sea, the fisherman catch them by imitating a clucking hen, and thus call them on shore. Queer people, queer fish, queer editors of agricultural papers, who print such stuff in their attempts to get up items on fish culture, when they have no idea of its very first principles. We meet this "item" often, and as it seemed incomplete, we have taken the liberty of finishing it.—*Live Stock Journal.*

How to Feed Young Fish.—N. A. B., Dunbar, Colorado, propounds a question to Dr. W. A. Pratt, of Elgin, Ill., to which the Dr. responds. The question is: What, in your opinion, is the best apparatus now in use for preparing the food for young trout, its cost, and where it may be had?

Any sausage grinder will answer the purpose. After grinding, chop with a knife, mixing a little water with it, but almost as early as the young fish commence to eat in the spring the green fly comes, and by running a wire across a pond and hanging a piece of liver upon it, the fly will "blow" it, and about the third day the maggots will commence dropping off, which will last the fish about two days, which makes an excellent food, and prevents fouling of the water. By hanging on some liver or a piece of meat once in two days, you can have a constant dropping of food for the young fish, and a very excellent food. There will be much less odor than one would expect. The liver or meat should not be hung more than a foot from the water.

Fish at the Centennial.

It is the desire of the Centennial Commission of the International Exhibition to afford all reasonable facilities for the exhibition of fish and the various appliances and processes used in fish culture.

All parties engaged in the propagation of fish as a business pursuit, will, no doubt, find it of advantage to exhibit; as also, those who are engaged in the manufacture of appliances for the culture and capture of fish.

It is therefore suggested that the Commissioners of Fisheries of the various States, take such concert of action as may surely accomplish so desirable an object. Individual effort, however praiseworthy, can hardly be relied upon as expressing the importance and prospective extent of this new national industry.

The exhibition will open May 10th, 1876, and will continue for six months. The details of arrangement for a display of fish and fish breeding apparatus will be under the administration of the Bureau of Agriculture.

The Woman's World.—Although they may not be willing to acknowledge it, the happiness of the race depends to a great extent upon women. They regulate the domestic life, and upon it, more than upon the great events which fill the pages of history, depend individual peace and comfort. Probably few things have more to do with the happiness of a household than the presence or absence of that exquisite tact which rounds the sharp corners, and softens the asperities of different characters, enabling people differing most widely to live together in peace, checred by mutual good offices. The possession of this quality is the especial characteristic, and its exercise one of the most delightful prerogatives of womanhood. We may be willing to lose all, to die, if need be, for those we love, but if we do not, from day to day, abstain from the little unkind or thoughtless acts which interfere with their comfort, we shall utterly fail to make them happy, and their hearts will inevitably escape us. The heroic and magnificent acts of life are few. To many but one, to most none comes in a lifetime. Therefore influence can only come through the right performance of the "trifles" which "make the sum of human things."

Women.

Duties and Privileges of Women.

BY M. E. THOMASSON.

Dear *Sister Readers of the Agriculturist*:—I had hoped long ago to have made your acquaintance, and enjoyed with you through the columns of our favorite journal, many social chats; but sickness and home duties have kept me silent; I have swept, dusted, and chased the flies; I have cooked, washed dishes, and darned the holes in my husband's socks, because those things must be done. Common opinion gives all such work, and very much beside to the wife. In this way much has been thrust upon woman that does not properly belong to her, and much withheld from her to which she has a just claim; I do not allude to the ballot box. It is my opinion that the right of suffrage would not help the matter, nor enable woman to do anything for which her constitution or her education has not fitted her; beside, does she not already exercise a voice in political affairs?

The life of men and women are inextricably intertwined; everywhere they are inseperable companions, giving and receiving influence; consequently the male vote is the product of both male and female thinking. One will seldom find an intelligent woman ignorant of the aims of political parties, but to require her to walk out on election day and deposit her individual vote, would be, to add to that chain of injustice, already too long.

Much has been said and much written, about woman's rights and woman's wrongs. My opinion is, were the wrongs removed, the rights would naturally assert themselves; but here lies the trouble, the wrongs have rooted themselves so firmly and assumed such natural colors, that any hasty attempt to uproot them, threatens unpleasant consequenses. Time, patience and education are the champions to accomplish this work. Woman must learn to distinguish between her real duties, and those imposed upon her through the custom of ages; she cannot do this without a proper knowledge of the laws that govern mankind.

I read an article in Sunday's *Ledger*, written by "somebody who thinks he knows all about it" and I believe he does know more about it than some folks. He gives his opinion of "what men need wives for:" "It is not to sweep the house, make the bed and cook the meals chiefly that a man wants a wife; if this is all he needs, hired help can do it cheaper than a wife; if this is all, when a young man calls to see a lady, send him in the pantry to taste the bread and cake she has made; send him to inspect needlework and bed-making; or put a broom in her hand and send him to witness its use. Such things are important, and the wise young man will look after them; but what the true man wants with a wife is her companionship, sympathy and love." How beautifully such sentiments harmonize with the original design.

I think it quite likely that Adam knew more about bread-making than the men of this generation know.

Men boast of their wisdom in this age; consider their laws just and equal; and declare that all the relations in life are properly and impartially arranged; but there never was a graver mistake. Where is the wisdom in sealing the fountains of useful knowledge to only one half of the human race? Would it not be as well to fertilize the mind and enrich the soul of woman as of man? It is the mothers of a country that shape its destiny. "As the child is nursed on the bosom of its mother so, on the character of woman the internal character of the race is formed and shaped.' How necessary then that woman be thoroughly trained in all the branches of learning which her children will need; it requires a cultivated understanding, and a well disciplined character to form the principles of the young; as the mother instructs, so the future man will think; the paths she marks he will follow; the prejudices she instills he will nurse; the generous fires she enkindles he will keep alive, and all for the good or the evil of his country and of humanity. It is for man to "shake the senate and the field;" to act his part bravely before the world; but at home and in the social circle is seen the perfection of womanhood; which perfection does not consist, (as some may imagine) in the wife's ability to accomplish the drudgery for a large family. There are homes, Alas! in which a woman is only a machine; turning out all sorts of work from dawn till dark while her children are growing up, deprived of their most sacred rights, remembering at last only the frown of a worn and weary face. Some of these sad homes the cruel hand of poverty has made; and in them manly hearts have bled for lack of power to shield a fair form; but ignorance and injustice have made many more than has poverty, and it behooves the world, if she would grow in power and in greatness, to see that the laws of God are respected.

Gilroy, Sept., 1875.

Woman the Equal of Man.

I have faith in man, but I have greater faith in woman. In many countries she has been, and still is, an article of merchandise. She has been educated as an inferior, and until the last few years has been denied an equal education in all the higher institutions of learning. But she has steadily advanced, socially and intellectually. The educated woman of our day would have been the wonder or horror of early civilization. She has attained, and holds without attack, a degree of liberty and various efficiency which would have violated the customs and shocked the prejudices of olden days. At each change and at every upward step have stood those pleaders whose posterity are yet reasoning in the same manner, affirming that already she was in her right place and should stay where Providence had placed her. For those who reason with faces prone to earth, think always that the state to which the world has grown in this day, is all that God meant it should ever be. Men of great conceit have even thought that time was ripe in them.

At length woman interested herself in literature. When she became a reader, men no longer wrote as if for men. She enforced purity and higher decorum. When she became a writer, men saw that guiding star which led them where the young child of Christian purity lay; for after all it is the pen that is the tongue of the world, and a woman's hand is becoming more influential than the orator's mouth.

Thus, step by step, against prejudices and arguments of her unfitness, against rude pushes downward, and much advice as to her proper duties (which in the main have been the drudgeries that men dislike) woman has advanced to a wider plain, to higher duties, to the liberty of following freely her own natural gifts, and to the reluctant recognition of her right to do whatever she could do well. Nor have the prophesies that, like bats, have flitted about her, been fulfilled. In the enlargement of her sphere she has forsaken no

duty of home and lost no grace of tenderness and love. She has become a better mother, daughter, sister, friend, by just that enlargement which it was predicted would unsex her. Experience has shown, that as woman is made to be worth more to society at large, she becomes richer at home, and is capable of building it better and administering its duties more skillfully and refinedly. Woman is not best in the family in those communities where she is most secluded. She is richest in all household excellencies in those which grant to her the liberty of widest activity, and motives to the exercise of her talents upon the largest scale. That vulgar and threadbare maxim, that "a woman ought to stay at home and take care of her husband's clothes and provide her children's food," is, as it were, a switch cut from the great tree of Arrogance, under which the despotic have always sat, and from which the strong have always cut their bludgeons and cudgels wherewith to strike down or chastise the week. A woman is better fitted for home who is also better fitted for something else. It is generous culture, it is power made skillful by exercise, that makes both men and women rich in domestic life. Whatever makes her a better thinker, a larger minded actor, a closer observer, a more potent writer or teacher, makes her, by just so much, a better wife and mother. No one is a better friend for being ignorant—no one a more tender companion for being weak and helpless. Our homes demand great hearts and strong heads.

Woman has proven her worth. Her motto has been onward, and to-day she stands not in man's shadow as an inferior being, but by his side as his equal. She is ever ready to share his prospefity or his adversity. She has a smile for his joy or a tear for woe. All along the earth-path, from the cradle to the grave, woman is man's ministering angel.—*Mrs. J. B. H. in Rural World.*

An Oft-Forgotten Fact.

A workingman once said, when the woman suffrage amendment was under discussion;

"What should my wife want to vote for? She doesn't earn a cent."

I suppose the man had the idea that the vote represented mainly money interest. Since his wife had no property and did not receive any money except through him, what rights had she?

"How much do you earn?" asked Miss H.

"Twelve dollars a week."

"How many children have you?"

"Five."

"Any hired girl?"

"I should think not, with five children to support on twelve dollars a week."

"Then your wife washes, sews and cooks for you all?"

"Of course."

"How much do you suppose it would cost to hire all that done?"

"Oh, I don't know; a great deal more than I can earn."

"And yet you say your wife doesn't earn a cent."

"Well, I never thought of calling that earning money."

"She does just as much toward keeping the family together as you do, and has just as much interest in what affects your trade or your children's welfare."

The man looked thoughtful, as if a new light was dawning upon him.

The gold dollar gets its value from arbitrary law and consent of the commercial world, and it makes no difference whether a day's labor produces from the mine one dollar or one hundred dollars. The power that fixes the value of the dollar in gold can as easily fix that value in any thing else it puts its coinage stamp upon.

Overcome evil with good.

Miscellany.

United States Land Patents

A GREAT many persons in California are uninformed of the true import and legal effect of a land patent of the United States. They believe that such document conveys to the patentee a clear, perfect and unassailable title to the land therein described. This belief is erroneous respecting Mexican Governments to their subjects and citizens in California. A patent from the United States for such lands is a writing given by the authority of the Government, duly authenticated by the proper officer, ceding to a certain person or persons all the right, title and interest of the United States in certain lands, held under genuine grants or titles from the former government of California. Such patents are simple quit-claim deeds from the United States, ceding all the said rights of our Government in and to all such lands particularly described in each patent issued to the respective patentees without prejudice to the rights of all other parties who may contest such patents in any court of competent jurisdiction, either on the ground of fraud in obtaining the same, or on allegation of holding a prior legal possession of portions of the land described in such patents. It is a notorious fact that great frauds have been perpetrated by astute landgrabbers and their associates for obtaining United States patents to lands in California, and many thousands of acres that really belong to the public domain, have thus been stolen by the connivance of lawyers and officials, who have procured and permitted the illegal extension of Mexican grants and mineral lands far beyond the true boundaries thereof, by *floating* the former over immense tracts that never were comprised within the limits expressed in the grants made by the Spanish and Mexican Governments, and by changing the true location of the latter, or in augmenting the quantities of the same, by the use of fictitious names, for obtaining more of such land than the law allows for each mineral claim. Settlers, who in good faith have occupied such public lands to the extent allowed by law, in the absolute certainty that their claims were situated upon public lands, and confiding in the probity of government officers for the protection of the same against insatiate land-grabbers, have been much harassed by lawsuits instituted by the latter for depriving the settlers of their lands thus pre-empted; and after much annoyance and expense, all their remonstrances and allegations have been disregarded. United States patents have been issued in favor of the land-grabbers, embracing hundreds of pre-emption claims situate upon Government lands. The settlers upon the same have been sued in ejectment and for damages in fabulous sums. The grabbers, as plaintiffs, triumphantly exhibit their United States patents to the same lands as positive, undeniable proof of their title thereto, and an irresolute or indifferent, ignorant judge decides in favor of the grabbers; whereby the settlers are compelled to accept the alternative of purchasing their claims at the arbitrary prices demanded by the grabbers, or of abandoning the same to go forth with their wives and children in search of new homes, and perhaps again become victims of oppression. There is no exaggeration in this statement. It is a true but lamentable account of cases that really have occurred in California. We say that such oppression is lamentable because it is illegal, and consequently unjust, that the rights of American citizens should be so scandalously disregarded by the officials whose sworn duty it is to protect land claims legally acquired, and also to defend the public domain from the unscrupulous robbers thereof, to the detriment of honest settlers and of the Government.—*News Letter.*

How a Settler was Outraged by Law.

On several occasions we have drawn public attention to the uncertainty of results when one goes to law without money. Nowhere has this fact been more fully impressed on us than in the ejectment suits started by Jack Sutherland. Mr. Hall was a neighbor of Bullard, whose land was recently in controversy, and had filed upon a quarter section, three-fourths of which was involved in the same controversy. When Bullard was dispossessed, Hall was dispossessed of these three-fourths also, by having his personal effects placed, by the sheriff, upon the undisputed fourth of government land. And since he intended to contest further for the whole quarter-section, he thought it not advisable to pay out for the fourth. He soon found his home covered by a new filing, and to-day he finds himself in the county jail, working out a fine of fifty days for having trespassed upon this land. Here we have the case of a man who entered upon a piece of land regularly surveyed by the United States authority, and knowing that for the last twelve years it has not been submerged. His filing was accepted in due form at the United States Land Office; and then, inch by inch, a swamp land claim shoves him from a home he has occupied for years, and incarcerates him for having been there at all.

Alas for Freedom! if her sons
Must linger in a felon's cell,
For daring to assert the rights
For which our fathers fought and fell.

—[*Visalia Delta.*

Short Weight Cheats.

The *Pacific Grocer* which is fighting against short weights etc., thus aims a shaft at "ye honest producer."

We have been rather free in censure of the course of manufacturers and packers in putting up short weights and measures, adulterating, etc., and we now send our greeting to those self-constituted models of honesty, purity, and simplicity—the Grangers. There is perhaps not a box of butter carried into this market containing full weight as represented by the number of rolls. This butter cheat is one of the favorite tricks of your "Mr. Hayseed." We have known him to refuse to have his butter put on the scales when trying to make a sale to a country merchant. He will say, "If you can't take my butter by the roll you can't have it at all;" and straightway he moves on to find some dealer who will take the butter, which will not average more than one and three-fourths pounds, at two full pounds each, and pay a high price for it. Again, Mr. Hayseed, we call your attention to your uniform method of sacking potatoes. You always put big ones on the sides, top, and bottom, and fill in with worthless little things, with a liberal quantity of clods of earth, small stones, and the like. Your apples, peaches, strawberries, and other fruits, are put up much after the same method, while your cord of wood usually consists of about three-fourths of the standard measurement, cunningly packed into a narrow frame so as to represent the appearance of a large bulk. Then your hay bales have been found to contain many pounds of adobe clods, with a liberal sprinkling of worthless rubbish from the baling ground. It is also currently reported that a rotten egg is considered as valuable to you as one fresh laid, and that it is the loyal duty of your fraternity to sell off the sick chickens to the good-for-nothing town people, so as to realize on them before they die.

The largest field of pineapples in the world is one in the Eastern District of New Providence, in the Bahamas. From one spot can be seen, at a single glance, 1,200,000 pineapples growing.

Subscribe for the Agriculturist.

EXCHANGE NOTICES.

As the time of the year is near at hand when most families should be thinking what periodicals they will subscribe for, for another year's reading, we make notice of some of our best exchanges and will continue the list another month.

First we call attention to Stock Jonrnals :

THE FARMERS' STOCK JOURNAL

Devoted to the development of the agricultural resources of the great west, and advocating the breeding and improvement of live stock whether in the hands of breeder or farmer, and published monthly by Alexander Charles, Ceder Rapids, Iowa, at $1.50 a year, is an excellent Journal of its class, and brother Charles is a practical man, schooled to labor on a farm, and knows how to run a paper for farmers. (See advertisement in our columns.)

THE NATIONAL LIVE STOCK JOURNAL

Published at Chicago, Ills., by Geo. W. Rust & Co., is one of the Standard Stock Journals in America. It is nicely gotten up, contains much valuable matter for stock men and farmers and should be seen by all., $2.15 a year. Sample copies. 18 cents in postage stamps.

THE IOWA FINE STOCK GAZETTE

Is another lively little journal, only $1.10 a year ; published at Vinton, by C. R. Wilkinson & Co., and devoted exclusively to the improvement of live stock raisers and dairy men. Sample copies, 10 cents.

THE COLORADO FARMERS' AND LIVE STOCK JOURNAL

Is published monthly at Denver, Col., $2 a year, by J. F. Wilber & Co. Sample copies 18 cents. It contains a variety of reading on agricultural subjects.

THE DROVERS JOURNAL

Is published at the Union Stock Yards, Chicago, Ill., weekly at $2.00, by L. H. Goodall & Co. Its live stock market reports are copious and correct, also other matters quite comprehensive.

THE AMERICAN SWINE AND POULTRY JOURNAL

Is another Iowa publication, published at Cedar Rapids by Ward & Darrah at only $1.00 a year. It is a very nicely gotten up monthly, and for those who are in search of information in any branch of these specialities, we reccommend it. A sample copy will be sent for 10 cents.

THE NORTH-WESTERN POULTRY JOURNAL

And Pigeon and Pet-Stock Advertiser, is published monthly by T. T. Bachelier, Minneapolis, Minn., at only $1.00 a year, and will be found interesting and instructive. Sample copies, 10 cents.

We find upon our table two excellent compact little monthlies devoted to Bee-Keeping.

THE BEE KEEPERS MAGAZINE.

A journal devoted exclusively to bee-culture, is published in New York City by King & Slocum, at $1.50 a year. Send 15 cents for sample.

THE AMERICAN BEE JOURNAL,

And National Bee Journal consolidated, published at Chicago, Ills., by Thomas G. Neuman at $2.00 a year is the other one. Sample cpies, 20 cents.

These Journals are similar in style and contents, and we are puzzled to choose between them if we would.

Of Health Journal's we now notice :

THE SCIENCE OF HEALTH.

A monthly advocate of correct habits, devoted to health on hygienic principles. It is published by S. R. Wells & Co., New York, at $2.00 a year. Single copies 20 cents. This is a sterling health magazine.

THE LAWS OF LIFE

By Dr. Jackson, published at the celebrated "Home on the Hillside," Danesville, New York, monthly, $1.50 a year, is a choice health periodical. 15 cents a sample copy.

THE HEALTH REFORMER

Is published by the Health-Reform Institute, Battle Creek, Michigan. $1.00 a year ; single numbers 10 cents. This monthly is devoted to physical, mental and moral culure.

Send for copies of each and select for yourselves and you will be satisfied, no matter which one you take, that you must have chosen the best.

Next month we will notice several of our favorite agricultural exchanges. Indeed, they are all favorites with us.

Some Hints about Raisin Making.

A correspondent of the Agricultural Department at Washington, writing from Malaga, gives some very valuable hints in reference to raisin making which we lay before our readers at this time for their instruction. According to this writer, the Muscatal grape is the one from which, as he styles them, "universally known Malaga raisins" are made. We give only extracts from the correspondent which relate particularly to drying and packing raisins :

In the neighborhood of Malaga and its "veyer," or valley, there are some very fine vineyards which produce large quantities of fruit; but in the opinion of the writer it will bear no compartson with the carefully grown fruit in the soil from the mountain-side, as first described by him; as in the rich, alluvial soil of the valley the grape fills out too readily, making juice instead of flesh, which latter is the indispensable requisite for fine packing raisins.

The difference is readily perceptible after they have been packed for a few months. Those of the valley shrink up with a sharp edge and acute wrinkle, becoming very hard; whereas the mountain-grown retain their fleshy fullness and soft plastic nature. The former, when first packed, have a bluish, velvety hue, whereas those from the hilly land assume a clarety, transparent color.

The process of drying this grape is naturally a very simple one, but at the same time, there are so many little circumstances attending it which so materially affect the subsequent operation of packing, that the subject is worthy of some consideration.

In picking the bunches of grapes, scissors should be used, so that in this operation the fine ones should not suffer any rough treatment or handling, as above everything the beautiful bloom of nature should be preserved intact.

The gatherer should, on the spot, sort out superior fruit, and from the vineyard convey it in flat baskets, of about two feet diameter and holding about forty pounds of grapes in a single layer, (as they must never press upon each other) on his head, to the drying floors, where he must lay the bunches most carefully close up against each other, so as completely to hide the ground, especially taking care to place them with their finest, handsomest and most perfect sides downward and next to the ground. The object of this is to preserve the beauty and bloom, so that they may subsequently adorn the face of the packed layers. The drying floors require nothing but the natural earth on which the grapes have been grown, except that they must be neatly and nicely laid, and be kept free from dust.

The practice has always been to shelter the flats with boards or canvas tents at night or when it threatens rain. It is not a good plan, however, to cover the grapes the first two nights after they are laid down, for it is found to be a good thing to let them enjoy the dew and freshness of the night, which counteract, in some degree, the tendency to dry too rapidly. The writer, however, has introduced into his establishment covers made of galvanized corrugated iron, which, although more expensive, he finds incomparably superior to those hitherto used. They are placed more rapidly, more completely, do not suffer through the sun as do the planks and canvas; and above all other considerations, instead of absorbing the damp, which in a slight degree is drawn out of the ground, they rather retain it on the flat, thus keeping the stalks of the raisins tough and pliable, whereby the packers are enabled to arrange and lay their layers without such a large amount of fine fruit being snapped off and condemned to the loose-raisin class.

The time required for raisin-drying varies according to the season, the aspect of the flats and many other causes, but I should say the average consumed may be computed at fifteen days; and one of the most important things attending the process is the selection of the proper moment for picking them up off the flats and packing or storing them.

One of the latest discoveries in Pompeii is a small woolen manufactory, situated very near the house where the fresco representing Orpheus was recently discovered. Several charred fragments of tapestry were found in this place, besides various machines for carding and weaving wool.

Industrial Expositions are of modern birth. They are now taking a front rank among the things which stimulate industry and help humanity. Their purpose is to encourage and glorify labor by displaying the grand aggregate of its trimmphs.

☞ The National Gold Medal was awarded to Bradley & Bulloson for the best photographs in the United States, and the Vienna medal for the best in the world.
429 Mantgomery street, San Francisco.

☞ Did you ever see how confectionary is manufactured. We lately dropped into the California Candy Factory, near the Opera House, and became convinced that Mr. Schroder understands the science of sweet things. He is always ready to entertain visitors, and what he does not make in his line it would be hard to find anywhere.

☞ Mr. F. Klien, who keeps the store and tin shop near the Post Office, San Jose, is a business man after the old times pattern. He is always hard at work when not waiting upon customers, of which he has not a few. His prices for goods are low, and we are glad to note that he is prospering as he deserves.

We regret that a letter from our representative at the State Fair came to hand too late for this month. But as it contains matters of much interest, we will give in connection with our notes of the Santa Clara Valley Fair next month.

☞ Tremendous rivalry in the jewelry business. Now is your time to get bargains. See Honriet & Co's radical announcement.

☞ That good suit of gray that the editor has been wearing every day for the last seven months was purchased at O'Banion and Kent's San Jose clothing store, opposite the Auzerais, for only $22. If any one can find a better bargain than that anywhere else he would like to know it. The suit is apparently not more than half worn out yet. O'Banion & Kent do business on the square, one-price system, and sell good clothing at the very lowest prices. Small profits and honorable dealing is their motto all the time. He speaks this "good word" without solicitation.

STRAWBERRIES and PEACHES,

NEW SORTS, BY MAIL.

Plants of the newest and finest improved sorts, carefully packed and prepaid by mail. My collection of Strawberries took the first premium for the best Collection at the great show of the Mass. Pleasant and Profitable Employment.—"Beautiful!" "Charming!" "Oh, how lovely!" "What are they worth?" &c. Such are the exclamations by those who see the large, elegant New Chromos produced by the European and American Chromo Publishing Co. They are all perfect Gems of Art. No one can resist the temptation to buy when seeing the Chromos. Canvassers, Agents, and ladies and gentlemen out of employment, will find this the best opening ever offered to make money. For full particulars, send stamp for confidential circular. Address F. GLEASON, & CO., 738 Washington St., Boston, Mass.

I. O. G. T.—GRANGER LODGE, No. 295, meets every MONDAY evening, at 8 o'clock, in their Hall, No. 284 Santa Clara street, over the S. J. Savings Bank. Members of sister Lodges and sojourning members in good standing are invited to attend.

JOHN B. STEVENS, W. Sec'y.

Every Intelligent Farmer knows that neither boys nor hired men are always to be relied upon, in his absence from home, for watering stock.

Every Stock Raiser will admit that a constant supply of water keeps his stock in an easy and contented condition, and they will consequently fatten faster. By the use of the ECLIPSE SELF-GOVERNING WIND-MILLS water can be abundantly furnished at any desired place.

By making a tank 16 ft. long, 8 ft. wide and 2 ft. deep, you have a reservoir of nearly 60 barrels of water, which the ECLIPSE MILL will keep filled, for occasional calms.

We do not build the ECLIPSE for a cheap mill. We make it for *service*, and our castings alone weigh 107 lbs. more than those of other mills. Our woodwork is too well known for comment, as all acknowledge our wide, heavy fans superior to the thin, narrow slats.

Having over 3,000 mills in successful operation, a purchaser knows just what he is buying.

Should you desire a windmill for any purpose, or pumps, address *Charles P. Hoag*, 118 *Beale St. San Francisco, Cal.*, for descriptive circulars.

HOW TO PAINT,

A New Work by a **Practical Painter,** designed for the use of **Tradesmen, Mechanics, Merchants, Farmers,** and as a Guide to **Professional Painters.** Containing a plain, common sense statement of the methods employed by Painters to produce satisfactory results in **Plain** and **Fancy Painting** of every description, including **Formulas for Mixing Paint in Oil or Water,** Tools required, etc. This is just the Book needed by any person having anything to paint, and makes **"every Man his own Painter."**

ENLARGED AND IMPROVED.

THE FARMERS'

STOCK JOURNAL,

Till it has no superior as a Farmer's and Stockman's Journal on the Continent; published on the finest quality of tinted book-paper, beautifully embellished with numerous engravings of Stock, the finest that artistic skill and money can secure, at only $1.50 per year, postage paid. It is no new enterprise, being in its 5th Volume, thoroughly established, recognized and patronized by the leading stock men and farmers of the East and West. Gives Engravings and Biographical Sketches of leading stock men. The best paper in the country to advertise in. It does not claim hundreds of thousands of readers in order to deceive advertisers; but it does claim to reach, by BONA FIDE subscription, nearly every agricultural State in the Union, and in many counties in Iowa its circulation exceeds that of the local press.

Send 10 cents for sample copy and you will like it. No attention paid to postal cards asking for samples.

ALEX. CHARLES,
Cedar Rapids, Iowa.

THE TRUTH ABOUT

The DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE,

IT DOES NOT TAKE AN HOUR TO GET ready to do a minute's work, but is always ready in a n inute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages : It prevents fulling or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Pleating.

The peculiar feature of DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor basting of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

IMPORTER AND BREEDER OF
THOROUGH-BRED
BERKSHIRE SWINE.

THOROUGHBRED SPANISH MERINOS

FOR SALE.

60 **One and two years old Thoroughbred** Spanish Merino Rams, California bred, from Ewes imported from Vermont, and sired by Severance & Peet's celebrated ram FREMONT, and by their ram GREEN MOUNTAIN, which took the first premiums at the Bay District and State Fairs. Last shearing, 35½ lbs., year's growth. Also, about 100 Ewes and Lambs, all of Green Mountain stock, bred this year.

je **B. F. WATKINS,** Santa Clara, Cal.

GEO. S. HOLMES,
(Formerly Needham & Co.,)

MANUFACTURER OF PICTURE FRAMES,

Number 438 First Street. —— **Opposite New York Bakery.**

IN STORE FROM THE EAST, A LARGE LOT OF READY-MADE SQUARE AND OVAL Walnut Frames, bought at a low price. Chromos mounted. Picture Frames of all sizes MADE TO ORDER at the *very lowest prices*. A choice lot of Chromos and Engravings bought at auction.

Low Rent and Low Prices. **Satisfaction Guaranteed.**

BREEDERS' DIRECTORY.

Parties desiring to purchase Live Stock will find in this Directory the names of some of the most reliable Breeders.

OUR RATES.—Cards of two lines or less will be inserted in this Directory at the rate of 50 cents per month. A line will average about eight words. Payable annually.

CATTLE.

C. B. POLHEMUS, San Jose, Santa Clara county, Cal., breeder of Short-Horn Cattle,

S. N. PUTNAM, breeder of Pure-bred Durham Cattle, Santa Clara, Cal.

S. B. EMERSON, Mountain View, Santa Clara county, Cal., breeder of Short-Horn and Holstein Cattle and Cotswold Sheep.

CHARLES CLARK, Milpitas, Santa Clara county, Cal., breeder of Short-Horn Cattle and Swine.

CYRUS JONES & CO., San Jose, Santa Clara county, Cal., breeders of Short-Horn Cattle. "Young Bulls for sale."

COLEMAN YOUNGER, San Jose, Santa Clara county, Cal., breeder of Short-Horn Cattle.

L. J. HANCHETT, San Jose, Santa Clara county, Cal., breeder of Short-Horn Cattle.

R. G. SNEATH, Menlo Park, San Mateo Co., Cal., choice Jersey Cows, Heifers and Bull Calves for sale

CARR & CHAPMAN, Gabilan, Monterey county, Cal., breeders of Trotting Horses, Short-Horn Cattle and Swine.

R. B. CANNON, Suisun, Solano county, California, breeder of Short-Horn Cattle and Swine.

JOS. L. CHAMBERS, St. Johns, Colusa county, Cal., breeder of Short-Horn Cattle.

C. COMSTOCK, Sacramento, California, breeder of Short-Horn Cattle.

J. BREWSTER, Galt Station, Sacramento county, Cal., breeder of Short-Horn Cattle.

WM. FLEMING, Napa, California, breeder of Short-Horn Cattle,

W. L. OVERHISER, Stockton, San Joaquin Co., Cal., breeder of Short-Horn Cattle and Swine.

J. B. REDMOND, Black Point, Marin county, Cal., breeder of Short-Horn Cattle.

MOSES WICK, Oroville, Butte county, California, breeder of Short-Horn Cattle.

J. R. ROSE, Lakeville, Sonoma county, California, breeder of Devon Cattle.

G. D. MORSE, San Francisco, Breeder of Short-Horn and Devon Cattle.

J. R. JEWELL, Petaluma, Sonoma county, Cal. breeder of Short-Horn Cattle.

SENECA DANIELS, Lakeville, Sonoma county, Cal., breeder of Devon Cattle.

JOHN JUDSON, Bloomfield, Sonoma county, Cal., breeder of Short-Horn Cattle.

A. MILLARD, San Rafael, Marin county, California, breeder of Jerseys and Alderneys.

H. P. LIVERMORE, San Francisco, breeder of Short-Horn Cattle.

DENNETT & PAGE, San Francisco, breeders of Short-Horn Cattle.

LEWIS PIERCE, Suisun, Solano county, California, breeder of Short-Horn Cattle.

SHEEP AND GOATS.

MRS. ROBERT BLACOW, Centerville, near Niles Station, Alameda county, Cal. Pure-blooded French Merino Rams and Ewes for sale.

A. G. STONESIFER, Hill's Ferry, Stanislaus Co., Cal., breeder of Pure-blooded French Merino Sheep.

A. VROMAN, Jenny Lind, Calaveras county, Cal., Cotswold Bucks for sale. References, Moody & Parish, San Francisco; Shippee, McKee & Co., Stockton.

LENDRUM & ROGERS, Watsonville, Cal., importers and breeders of Pure Angora Goats.

C. P. BAILEY, San Jose Cal., importer, breeder and dealer in Cashmere or Angora Goats. Fine Pure-bred and Grade Goats for sale.

LENDRUM & ROGERS, Watsonville, Cal. Importers and breeders of the finest Cotswold Sheep and Angora Goats.

McCRACKEN & LEWIS, San Jose, Cal. Importers and breeders of fine Angora Goats. Also, fine Cotswold graded bucks for sale.

THOS. BUTTERFIELD & SON,
BREEDERS AND IMPORTERS OF
ANGORA OR CASHMERE GOATS,
Also, Cotswold and other long wool Sheep. Also FRENCH AND SPANISH MERINOS.
HOLLISTER, MONTEREY CO., CAL.

SWINE.

CHARLES CLARK, Milpitas, Santa Clara County, Cal., breeder of Purebred Berkshire Swine.

POULTRY.

MRS. L. J. WATKINS, Santa Clara, Premium Fowls. White and Brown Leghorn, S. S. Hamburg, L. Brahmas, B. B. Red Game, Game Bantams, and Aylesbury Ducks. Also, Eggs.

M. FALLON, Seventh and Oak streets, Oakland, Cal., offers for sale Eggs from every variety of choice Fowls.

ALBERT E. BURBANK, 43 and 44 California Market, San Francisco, importer and breeder of Fancy Fowls, Pigeons, Rabbits, etc.

MEAT MARKETS.

TEDDY & BRO., Stall No. 1, City Market, do a general butchering and market business. City orders delivered free of extra charge.

MISCELLANEOUS.

S. HARRIS HARRING, San Jose, Cal., agent for several breeders of Best Purebred animals and poultry. We bring the breeder and purchaser together direct, and do not stand between them, while we aid each for moderate pay.

DAWSON & BANCROFT, U. S. Live Stock Exchange, southeast corner of Fifth and Bryant streets San Francisco. All kinds of common and thoroughbred Stock always on exhibition and for sale.

SPLENDID CARD PHOTOGRAPHS, only **$2** a dozen, and Cabinets **$1** a dozen, at HOWLAND'S Gallery (Herring's old stand) No. 339 First street, San Jose. fe ly

WALLACE & ROBBINS, 386 First street, Handsome hearses always on hand at fair prices. Fine hearse for funerals. Carriages for sale. Give us a trial.

B. SANGUINETTI, 418 and 420 First st. Bookcases, wardrobes, kitchen safes and picture frames made to order. Furniture made and repaired.

The California Agriculturist
AND
LIVE STOCK JOURNAL.

Vol. 6. San Jose, Cal., November, 1875. No. 11

FAIR NOTES.

We did intend writing up very complete notes of the exhibition of industrial interests of the annual Santa Clara Valley Agricultural Society's Fair this season, but owing to the lateness of getting out the November issue, we will only call attention to the most striking features, and note the steady advance of improvements. There was much more interest felt in the exhibition of fine stock than ever before, both by exhibitors and the masses of the people. Although the horse-racing was set up as the great feature, there was a good display of useful horses, and they attracted attention. No better cattle exhibit was ever held in this State. A parade of these called out a large attendance of people.

The exhibit of swine was the best we have seen, although Mr. R. S. Thompson and Mr. Mills, neither of them, showed their fine Berkshires. Poultry attracted a good deal of attention, also. In fact, people are awake to the value of good breeds of all kinds of live stock.

Manufacturers stepped to the front with some of the best implements ever before seen on this Coast. The Straw-Burner thresher was there, several improved gang plows put on trial, and much interest shown in agricultural machinery and implements.

The wagon and carriage makers of San Jose did much credit to themselves and to the town by their large and handsome show of excellent work. No person needs to import work when such can be obtained at home.

The furniture shown from our home manufactory was of a very superior quality. The woolen goods were unrivalled by those made anywhere. The gloves made by Wilcox & Williams were as fine as any one ever saw, and as good, too. The Angora Glove and Robe Company exhibited goods that attracted much curiosity and elicited much praise. This company is doing more to develop the Angora goat business and make it at once remunerative and popular than has ever before been done in Europe or America.

Our nurserymen did much to show what fine plants they are now producing. Many species of tropical plants that are proving to be hardy in our climate were shown. Particularly of the palm family there were many varieties. Rock, Sanderson and Fox were the principal exhibitors in this line. O'Donnell confined his show this season to a display of curiosities from his Public Garden. The showing of fruits, though not so large as sometimes, contained all the most choice varieties. In fact, our growers have now got the fruit business so reduced to a certainty, that a few varieties—the best—are all that they care to cultivate for the market.

In the fine arts we find that there is considerable talent in San Jose. Mr. Brewer's plaster statue of S. A. Bishop, our "common sense" and "age of reason" horse-railroad man, was life-like and exhibited a good deal of ability, both of artist and subject. Coombs showed some superior sculpture work. Miss Lotz deserves more than a mere mention for her painting. As a painter of animals, she is bound to gain fame if she perseveres, and no mistake. There were many other very notable improvements and worthy exhibitions which deserve praise. One thing is sure, there is no locality in the State of California that can show so many fine animals and so varied an array of productions of utility and artistic merit, as can Santa Clara county. The State Fair this year, so say good judges, fell short of ours in point of worthy exhibitions. All that our local Agricultural Society needs is to reform some of the horse-race gambling features and prohibit liquor selling on the grounds, to make our fairs worthy of the name indeed. There is enough of industrial worth here to draw everybody to see, if the products were all on exhibition.

Let our premiums reward the producers, instead of entertaining a lot of black-legs, and we will succeed in more directions than one. The fairs can be so economically conducted as to pay expenses without gambling, and so conducted in the best interests of the whole people as to pay largely in doing good, at the same time that they afford pleasure to all.

SOMETHING FROM NEVADA.

Mr. I. T. Wood, of Carson City, Nevada, in a letter containing two new subscribtions says: It is a great pleasure to recommend the CALIFORNIA AGRICULTURIST, it gives such good satisfaction. It is destined to have a large circulation in the State of Nevada. Every new subscriber here says that is is just the paper that they need.

Our correspondent also adds the following intelligence: The last few years have established the fact that we are at the head as an apple-growing State. Nevada apples command one cent more a pound than California apples, and will keep two months longer than some varieties of California apples. Ours are finer grained texture, are crisper and of superior flavor. Nevada is not surpassed in the production of hardy fruits, and many thousand fruit trees will be planted this season in our State. Nevada is something more than a mining State.

[We have long known this, and advocated it too. We spent two years in Nevada some nine years ago, and carried a lot of trees there and helped plant an orchard on Tolle's ranch, near Reno. Also took twenty-four hives of bees into Nevada. We found it up-hill work to introduce fruit trees or bees there, as but few persons would have any faith that they would amount to anything. But we saw fine fruit grow there, and took as high as seventy-five pounds of good honey from a hive of bees in a single season, besides leaving enough for the bees. The sage brush and other wild plants furnish fine pasturage for the bees, as well as live-stock generally; and the sage brush soil, where it can be irrigated, is generally very productive of vegetables, hay or grain. Alfalfa, of which there was not probably fifty acres in cultivation in Nevada, when we were there, is now one of their most valuable crops.—Indeed it is something more than a mining State. It is fast being developed into one of the finest agricultural districts on this unsurpassed Pacific slope.]

An Apology is what any publisher of a periodical dislikes very much to make, and, also, what readers don't care to be bothered with. They would rather see every thing running smoothly and to their satisfaction without it and so would we. But we believe that the relation between publisher and patron should be such that perfect frankness and confidence can at all time be maintained between them. It is *your paper* as much as it is ours. Ours to produce, yours to appropriate. There is no middle man in the arrangement excepting the postmaster. But this is not apologizing. What we wish to say is that we owe our readers some explanation for being so late this month. It was owing to a conflicting copartnership that had to be settled before proceeding. It is settled now, and we move on with increased assurance of giving satisfaction to our readers and of making a general success of the enterprise. The AGRICULTURIST will keep right on in the path of progress and our readers may rest assured that it will not only prove itself worthy of their patronage, but will induce them to take a deeper interest in its advancement. Let every friend feel a personal interst in this matser for all the good that can be accomplished.

☞ We are determined to adhere to to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, render this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Best Fruits to Cultivate.—Next month we shall give our readers a list of best kinds and varieties of fruits for a family orchard, also best varieties for shipping East, and for drying etc. Our reliable orchardists and most experienced fruit-growers will be consulted in this matter for authority.

What's in a Name?—There is a Santa Clara valley, also a San Jose valley in Southern California. We don't charge them with stealing the livery of heaven to serve, etc., but with all their boasting they cannot excel in points of soil, climate and civilization—the places by the same names in Santa Clara county. They can borrow our name but not our fame.

The People generally demand cheaper postage, not only on transient newspapers, but on all other third-class matter. The Post Office will gain, not lose by a cheaper postage. Express monopolies are the only parties benefited by dear postage—they not only want to run a legitimate business, but to run the Government in favor of extortion. Cheaper postage is the people's demand.

The Russian Grain Harvest is authoratively reported as very short this season. Great Britain will need about the usual amount as last year, as near as we can approximate, and will call on California for all she can spare, at remunerative prices. Although our prospects for next year's crop is now good; yet we feel safe in predicting a rise in the price for the present crop on hand, and think it safe to hold for an advance on present prices.

Our Readers will Notice that our lady correspondents and grandfather have promised an unusual feast of good things for indoors this month. It has been said with more truth than flattery that the CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL is the best household journal on this coast. We mean that it shall be at any rate, for as we have often said before the best part of any well conducted farm is, or should be, indoors, and the credit belongs to the wives, mothers and daughters who conduct the household department.

Peas, as a farm crop where there is stock, particularly hogs, are found to be quite profitable. Sown with barley or oats, they will ripen about the same time, and will stand up better for the scythe. When cut green for feed, hogs, horses and cows will eat them ravenously. They make good pasturage, also. Sown now, they will be fit for table green very early. Peas are as easily grown as wheat or barley, but do best in rich, deep soil. Sow some, if only on trial.

Prepare your Ground for an orchard by plowing it thoroughly as deep as you like. We believe in deep plowing of ground where an orchard is to be set. After the trees are three or four years planted, thorough shallow cultivation is all that is required. Drag the soil down as nearly plane as possible. Work it well. Mark off the land, sticking a stake in exact line of rows in every place where you are to plant a tree. This preliminary work is necessary to good, even planting, and it is always best to make a job look well. Next month we will give more information, with list of best varieties for an orchard.

For a Vegetable Garden it is well to spread manure on the surface heavily and harrow it finely at this season. After the weeds have made a good start, turn them under with a plow, harrowing well again. At the end of a week or two plow again and harrow. Another plowing in January, just before planting beets, carrots, turnips, onions etc., will be well and destroy more weeds. Remember that, with the soil well saturated as it now is, you can easily make a good garden for home use, even on dry upland. Sow cabbage and cauliflower seed for plants right away, in a bed away from chickens and where it can be sheltered from frost.

Plant out Shade and ornamental trees until every public highway and avenue is lined with them. Remember that the Code enjoins upon County Supervisors to promote the planting of trees, and as inducements on the part of owners of land entitles them to a premium of one dollar for every tree set out, when it shall have attained the age of four years. By co-operating together for the purpose, every neighborhood and township could be beautified and made more valuable by the planting of trees in front of every farm. The one dollar per tree will pay the expense of planting and caring for the trees. Every grange and farmers' club should canvas this matter earnestly, to its practical consummation.

Our Readers will probably take more interest in an announcement to the effect that the CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL is soon to be vastly improved in its appearance. We are employing the best ability on this coast in designing and engraving a new head for our monthly, and have other first-class improvements under way, so that we expect to present to our readers in January a periodical that for real merits cannot be surpassed in America for the money. We shall also start in January with 1,000 larger circulation than a year ago. We want to double the circulation this year and shall do so if possible with the assistance of our present subscribers. We are arranging to offer splendid inducements to old and new subscribers to work for the CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL, which every reader, old and young, rich and poor, will be pleased to entertain.

Palace Hotel Squashes and stump-the-world beets have become so common in California that it is hardly thought worth while to take the trouble to exhibit them in our agricultural fairs. Now has turned up an enormous turnip from San Luis Obispo county, one of the small English variety. Our old friend, Mr. J. F. Halloway, who has just bought a farm adjoining the one on which this candidate for vegetable honors grew, came packing it into our office lately, and showed us that this turnip measured two feet four inches in circumference and weighed eight pounds. This turnip was finely formed and proportioned. It grew on mesa or upland, without irrigation. Mr. Holloway has been traveling for some time to find a locality and piece of land to suit him for a home and he thinks he has found the spot at last. Where such turnips grow is a good place to vegetate.

Gradually reforms are working in civil law and there is need enough for them too. The Grangers' Fee Bill, a bill that the Patrons of Husbandry are about to introduce before the Legislature of this State, is a move in the right direction and should become a law. It is for the purpose of limiting the amount chargeable in cases where no special contract is made, as to fees. We understand this is to apply to lawyers and other professional services. Lawyers in particular have before their courts, among themselves, almost or quite unlimited power to make and exact most exorbitant bills for services rendered. They are mutually interested to make their services as valuable as possible to *themselves*. We know how it is, and hope to see this ring broken. And we would like to see the pay for all professional services predicated upon actual values of first-class labor in productive and mechanical pursuits. If this is drawing the line too close to suit them, let them take the benefit by going to work and realizing the pay for labor. As to qualifications, it takes just as long and requires just as much application of mind and muscle to become a first-class mechanic or farmer, as it does to reach the higher rounds in any other calling, and we believe that true justice should more nearly equalize the pay for all intelligent services.

Poetry.

I FORCIVE.

BY ISAAC KINLEY.

O H, never were words so fondly meet
By tongue of mortal spoken;
Oh, ne'er was uttered thought so sweet
As that dear, holy token—
I forgive.

I speak the soothing, sacred word;
It hath no tone of sorrow.
There's joy wherec'er its sound is heard,
It brings no sting to-morrow.
I forgive,

Yet I've had wrongs, and madly deep
My spirit hath been stirred;
But passion soothed itself to sleep
When in my heart was heard,
"I forgive."

Forgive each word, forgive each deed,
If aught of wrong is done then,
For soon thy aching heart will bleed
If vengeful thoughts have won thee.
I forgive.

Each angered thought we must control,
The fires of passion smother,
No malice cherish in the soul,
No evil for a brother.
I forgive.

Forgive, forgive! 'tis God's command—
Forgive and be forgiven;
Forgive and take the proffered hand
That leads thee on to heaven-
I forgive.

San Jose Institute, Nov., 1875.

The Farmer King.

The farmer sat in his old arm-chair,
Rosy and fair,
Contented there,
"Kate, I declare,"
He said to his wife who was knitting near,
"We need not fear
The hard times here,
Though the leaf of life is yellow and sere,

"I'm the king and you are the queen
Of this fair scene,
These fields of green
And gold between.
These cattle grazing upon the hill,
Taking their fill,
And sheep so still,
Like many held by a single will;

"These barnyard fowls are our subjects all;
They heed the call,
And like a squall,
On fast wings fall,
Whenever we scatter for them the grain;
'Tis not in vain
We live and reign,
In this our happy and calm domain.

"And whether the day be dim or fine,
In rain and shine,
These lands of mine,
And fields of thine,
In cloudy shade and in sunny glow,
Will overflow
With crops that grow,
When gold is high and when it's low.

"Unvexed with shifting of stocks and shares,
And bulls and bears,
Stripes and cares,
And the affairs
Of speculation in mart and street;
In this retreat
Sweet peace can meet
With plenty on her rural beat."

The Independent Farmer.

BY HENRY W. HERBERT.

How pleasant it seems to live on a farm,
Where Nature's so gaudily dressed,
And sit 'neath the shade of the old locust tree,
As the sun is just sinking to rest;
But not half so pleasant to hoe in the field,
Where the witch-grass is six inches high,
With the hot scorching sun pouring down on your back—
Seems each moment as though he would die!

'Tis pleasant to sit in the cool porch door,
While you smoke, half-reclined at your ease,
Looking out o'er your beautiful field of grass
As it sways to and fro in the breeze;
But not quite so pleasant to start with your scythe,
Ere the morning sun smiles o'er the land,
And work till your clothes are completely wet through
And blisters cover your hands.

In keeping a dairy there's surely delight;
And it speaks of contentment and plenty,
To see a large stable well filled with choice cows,
Say numbering fifteen to twenty;
And yet it seems hard when you've worked from the dawn
Till the sun disappears from your sight,
To think of the cows you have yet got to milk
Before you retire for the night.

But the task fairly over you cheer up once more,
And joyfully seek your repose,
To dream of the cream-pots with luxury filled,
And milk-pans in numberless rows;
But the sweet dream is broken when early next day
You're politely requested to churn,
And for three weary hours, with strength ebbing fast,
The victim despondingly turns!

But in raising your pigs there is truly a charm,
When they sell at the present high price;
And of all the young stocks which a farmer can raise,
There's nothing that looks half so nice.
How cheerful one feels when he leaves them at night,
The encouraging number of eleven!
But his joy slightly wanes when he goes out next day,
And of five ones can count only seven!

But no one disputes that the farmer is blessed
With true independence and labor,
Whose food don't depend on the whims of mankind,
Like that of his mercantile neighbor.
For God in His mercy looks down from above
And patiently gives him his bread,
Provided he works eighteen hours every day,
And devotes only six to his bed.

Waiting for Luck.

Ho! ye who are listless and moping,
Sit dismally twirling your thumbs,
And gloomily waiting and watching
For something that thus never comes;
You might just as well, foolish mortals,
Expect you'll by lightning be struck;
One will happen as soon as the other.
Don't stand around waiting for luck.

There's a saying—a good and a true one—
(Take courage, you poor one who delves
With a stout heart so bravely) that "Heaven
Will help those who first help themselves."
And you'll find, if you wish for good fortune,
A pretty good way is to tuck
Up your shirt-sleeves and start out and find it;
Don't sit around waiting for luck.

You may pine and mope on forever—
Find fault and deplore your hard fate—
But you'd better remember the proverb,
And act on it ere it's too late.
You may pout and grumble forever;
Just so long you'll find you are stuck
In mire of sloth and amusement.
Don't sit around waiting for luck.

There is wealth to be had—go and seek it;
And with it get honor and fame.
By the sweat of your brow you can gain them,
And carve for yourself a proud name.
But to do this take tact and ambition,
Persistency, hope and some pluck.
Are you ready? then lose not a moment!
Don't sit around waiting for luck!

Autumnal.

BY J. G. WHITTIER.

The Summer warmth has left the sky,
The Summer songs have died away,
And withered in the footpaths lie
The fallen leaves, but yesterday
With ruby and with topaz gay.

The grass is growing on the hill;
No pale, belated flowers recall
The astral fringes of the rills;
And sharply the dead vines fall,
Frost-blackened from the roadside wall.

Yet, through the gray and somber wood,
Against the dusk of fir and pine,
Last of their floral sisterhood,
The hazel's yellow blossoms shine—
The kindly gold of Afric's mine.

Small beauty hath my unsung flower
For Spring to own or Summer hail;
But in the season's saddest hours,
To skies that weep and winds that wail
Its glad surprises never fail.

O, days grown cold! O, life grown old!
No rose of June may bloom again;
But like the hazel's twisted gold,
Through early frost and latter rain
Shall hints of Summer time remain.

And, as within the hazel's bough,
A gift of mystic virtue dwells,
That points to golden ores below,
And in dry, desert places tells
Where flow unseen the cool, sweet wells—

So, in the wise diviner's hand,
Be mine the hazel's grateful part,
To feel, beneath a thirsty land,
The living waters thrill and start,
The beating of the rivulet's heart,

Sufficeth me the gift to light
With latest bloom the dark, cold days;
To call some hidden spring to sight,
That in these dry and dusty ways
Shall sing its pleasant song of praise.

O, Love! the hazel-wand may fail,
But thou canst lend the surer spell,
That, passing over Baca's vale,
Repeats the old-time miracle,
And makes the desert land a well.

The Autumn of the World.

The last wan petals leave the rose,
The latest swallows plume for flight,
The Summer's gone where no one knows,
With dead men's love and spent years' light,
And warm hearts buried out of sight.

Red roses are the crown of youth;
The warm light strikes on lover's lips.
Laugh, then, and fondle, happy mouth;
And yet remember, sweet time slips—
Death hurries on with full eclipse.

So short, so sad! O, let not Death
Find only faded flowers and wine,
When, hungry for the joyous breath
That dreams not of the year's decline,
He lays his cold, white mouth to thine.

Cling to the flying hours; and yet
Let one pure hope, one great desire,
Like song on dying lips be set,
That, ere we fall in scattered fire,
Our hopes may lift the world's heart higher.

Here in the Autumn month of Time,
Before the great New Year can break,
Some little way our feet should climb,
Some little mark our words should make,
For liberty's and manhood's sake.

Clear brain and sympathetic heart,
A spirit on flame with love for man.
Hand swift to labor, slow to part—
If any good since time began
The soul can fashion, such souls can.

And so when we are dead and past,
The undying world will some day reach
Its glorious hour of dawn at last,
And across Time's sunken beach
May smile, one moment, each to each.

Autumn's Last Rosary.

BY THOMAS HOOD.

The squirrel gloats over his accomplished hoard,
The ants have brimmed their garners with ripe grain,
And honey-bees have stored
The sweets of Summer in their luscious cells.
The swallows all have winged across the main;
But here the Autumn melancholy dwells
And sighs her tuneful spells
Amongst the sunless shadows of the plain.
Alone, alone,
Upon a mossy stone
She sits and reckons up the dead and gone,
With the last leaves for a love-rosary,
While all the withered world looks drearily,
Like a dim picture of the drowned past
In the hushed mind's mysterious far-away,
Doubtful what ghostly thing will teel the last
Into that distance, gray upon the gray.

The First Breath of Autumn.

I heard a voice of Autumn in the trees
Calling for me, who in far Summer lands
Dwelt and made merry. In the fragrant ease
Of the unpeopled uplands, on the sands
Of Proteus' home, I had cast off the bands
Which bound me to my fellows and their cares,
Living, as 'twere, in Eden unawares,
Entranced by music of the salty strands;
The morning birds there cheated morning air
To linger till the silent breast of noon
Laid her rich warmth upon the dear earth's heart,
And lingered there in turn, till sunset soon
Grown angry, called her swiftly to depart;
Thus loitering, heard I Autumn cry, "Prepare."
—[Harper's Magazine for October.

Bordered with trees whose gay leaves fly
On every breath that sweeps the sky
The fresh, dark acres furrowed lie,
And ask the sower's hand.
Loose the tired steed and let him go
To pasture where the gentiass blow:
And we, who till the grateful ground,
Fling we the golden shower around.
Fling wide the generous grain. We fling
O'er the dark mold the green of Spring,

ANOTHER RAILROAD SCHEME ON FOOT.

The Government, i. e. the people is to be asked to endorse another little beneficial enterprise. The enormous monopoly established by Government grants of money and lands—(on the second mortgage plan, which an inside ring adroitly worked up,) the great overland route now in existence has, become burdensome and oppressive, and the people are asked to apply an allopathic dose of *counter irritation*, by building a rival road. Another blister in the form of Government obligations is asked for, not to enrich anybody this time. Oh, no, of course not. It is all on the square for the advantage of the poor, honest people. And don't the people need a little help? to be sure after all they have suffered and are suffering. We do not care to argue this question. We are too much disgusted with the big steal business to ever consent to see the Government made a responsible party to any more schemes to enrich corporations or individuals in any such way. When the Government condemns all private and incorporate railroad titles and itself becomes owner of them all, and runs them in the economical interests of the people, it will be soon enough to talk about building another road. Until such time let corporations calculate such business on its own merits and if it cannot rest on that, let it go till such time as it can. The New York daily *Bulletin* contains an article on this subject from which we extract the following facts:

What is styled a "National Railroad Convention" is announced to meet in St, Louis this month, to which members of Boards of Trade and political bodies, as well as railroad officers, are invited. Though no programme is given out, it requires only ordinary discernment to see that the principal, if not the only subject of deliberation, will be an effort to commit that body to supporting Tom Scott's Texas and Pacific Railroad subsidy scheme, with Atlantic and Pacific connection by way of St. Louis engrafted on it, which, it is understood, is to be pressed upon Congressional attention again this winter. Its promoters affect to believe that this measure has better chance of Congressional favor now than then, owing partly to the presence of a Democratic majority in the lower house, many of them new men, and to an increased pressure upon them from outside bodies, and to certain amendments in the bill itself, designed to reconcile the conflicting interests and claims of the Southwestern cities. The proposition, as we understand it, does not ask for a direct issue of Govenment bonds—as that would run counter to the public sense of propriety and to an act of Congress expressly prohibiting an increase of the public debt—but calls for the Government guaranty or endorsement of the Company bonds to an amount averaging $40,000 per mile for the 1,450 miles between Fort Worth and San Diego, and for 500 to 1,500 miles more for branches leading to St. Louis, Cairo, Memphis, Vicksburg, New Orleans, Galveston and Indianola. In other words, it seeks to commit the public to an annual interest liability, as endorser, for railroad construction purposes on something like $70,000,000 of paper obligation for a series of years—probably until the roads are able to earn the amount, viz: $3,500,000 per annum, in gold. It is true, that, as drawn, the bill does not call for an abstraction of this amount semi-annually out of the Treasury, but the amount of bonds per mile is made enough at the outset to permit a portion of them being withheld, and from the sales of the same, as the interest on the remainder accrues, it is to be paid, In plain language, it is designed to borrow under this public guarantee, in addition to its cost, to pay the interest on its cost for a series years, longer or shorter, as the case may be. This bill is ingeniously drawn to avoid the numerous objections which will rise up all over the country to any policy of using public money for the furtherance of private ends. That it does, nevertheless, take from the Government something of great value must be the fact, or otherwise such tremendous exertions would not be made to secure its adoption.

IRRIGATION.

This most vital of all subjects to the material prosperity of California, is just now, as it should be, occupying the earnest consideration of some of the first minds in the State. They could not be better employed. Without water, many sections of our State, are, to all intents and purposes, deserts. Not that they are barren, sandy wastes, like the Saharas of Africa. By no means; for when supplied with water, either from the clouds or through irrigating ditches, they are found to be the most productive soils in the world. Water, then, is the great *desideratum*, and water must be had.

It is our humble opinion, that the State, through her Legislature, should inaugurate a general system of irrigation. One of the very first steps in this direction should be an Act to condemn any and all waters in the State suitable to the purpose. The next, the appointment of a Board, whose duties should be to take possession of all such streams, and utilize them, through proper ditches, for the irrigation of all lands to which they could be applied. Of course these ditches could not be constructed all at once. The system would be one which, commenced now, would reach on down to future generations. It would cost millions of dollars, and could be carried out only in accordance with the financial ability of the State treasury. A reasonable tax should be levied on those farmers who should use the water, to cover interest on the capital expended, make repairs, and in course of time reimburse the treasury for the original outlay. In all other countries, Italy, Lombardy, Spain and Mexico, where irrigation has been used to a large extent, the system has been a governmental measure. The ditches have been constructed by the government, and laws passed to regulate the distribution of the water. These systems have been successes, and we therefore advocate them here. If left to private incorporations, we believe it will be the fruitful source of litigation, confusion and the usual amount of extortion and dissatisfaction that attend all such undertakings.

Certainly some measure can be adopted that will not embarrass the finances of the State, backed up by the increased productiveness and wealth of the soil irrigated. The results would be equally beneficial to all industrial interests, if correctly planned and executed. As it now is, the people's hands are tied in this matter. Farmers cannot and dare not take out water on their own account in many instances, and co-operation among individuals where interests are conflicting or litigation is possible, is unsatisfactory, and distrust very often forbids communities attempting much in this matter. The State could and should control all waters and irrigation for the general good.

RETRACTION.

Mr. J. P. Ross, of Lompoc, writes to us that he seriously regrets the publication of his private letter, wherein he spoke of Mrs. Swantons death and of her husband's abuse, etc. He says now that his informant exaggerated a mere rumor without foundation in fact, and that he did not write from his own knowledge at all. He says he has investigated the matter for himself and desires to justify Mr. Swanton from the charges totally. This is not the first time that rumors have taken wings as real facts. We blame our old friend Ross for stating as facts what he had no proof of. Our only object in publishing the letter (see page 199, September No.) was to show the terrible demoralizing effect of intoxicating liquors when used immoderately, also to show the fearful results arising from such abuses. We also sympathized with the sufferers, and with the temperance movement against those who were instrumental in working such ruin. We had the confidence in our correspondent to believe his word without question. We hope this will be a lesson for all of us to be careful how we give attention to rumors, and, above all, how we spread as truths what we are not positive about. There is too much of this thing done. Something maliciously, often thoughtlessly and occasionally honestly. Whatever the object an injustice is oftener than otherwise done somebody. On general principles we are inclined to the opinion that there is much less evil in the world among people in respectable society than many apprehend. We know the Swanton family personally to be respectable and well-meaning people, and regret that any falsehood should have found its way into our journal, although it reflected not so much upon any one's honor, as upon the liquor traffic itself; for every one knows that it is often the pettied promising and ambitious ones who lose their self-control and become lost to highest feelings and duties through indulgence in alcoholic stimulants. It has been truly said that no poison other than alcohol will cause a man to abuse his best friends. While we regret that we published Ross' personal letter, we are rejoiced to learn authoritively that Mr. Swanton is innocent of the imputation the letter contained; as to his treatment of his wife—their separation, etc., and in justice to him and his family, we gladly retract all that the letter above referred to contained about Mr. Swanton.

SPONTANEOUS GENERATION.

It is still thought, by some persons, as we see by our exchanges, that oak trees springing up, after the destruction of a pine forest, on the same ground, is proof of so-called spontaneous generation of plants. We had an opportunity of examining this point personally, and gladly availed ourselves of it. A destructive fire occurred in a piece of forest not far from where we lived. It was only stopped by a heavy fall of rain. In the third or fourth year after the fire the whole face of the earth was covered with young oak trees, from one to three years old. Where did the young oaks come from? Did they grow from acorns? Undoubtedly they did. On examining the soil it was found full of acorns and acorn-shells. The fallen pine trees were also found full of acorns and empty acorn-shells. The red-headed woodpeckers had inserted thousands of them in holes which they had dug in the soft pine bark for their reception. In many cases only the shells were left. These were those on which the birds had lived during the past winters. But in other cases the bark had grown over the acorns and embedded them so deep that they were equally protected from the weather and the birds. When dug out they were found perfectly sound. Where the fallen trees were partially embedded in the soil, the acorns were found swelling and sprouting as far up as the moisture, air, heat and light could reach them. Limbs of the trees were found scattered everywhere in the same condition. Can any one doubt the true source of the oaks in these cases? And yet such phenomena have been erroneously instanced as proofs of spontaneous generation! It only requires a little observation and research to arrive at the truth in these cases. We apprehend that the same scrutiny will explode all other supposed cases of the same kind, notwithstanding Prof. Tyndall's aphorism that "matter contains within itself the power and potency of all life;" but robbed of its tautology, this simply means that matter under favorable circumstances produces acorns, and that acorns, under the same, produce oaks—all of which no one will deny.

ALDEN FACTORY RAISINS, ETC.

We promised to inform our readers as to the success of drying grapes into raisins at the Alden Factory in San Jose this season.

Mr. C. T. Settle, the worthy Superintendent, went to considerable expense to thoroughly inform himself how to proceed and in making preparations for a thorough trial and experiment. He fixed a lot of racks so that he could cure them slowly, and be several days about it if necessary. He frankly owns that he has not been as successful as he expected to be. The raisins he dried are not first-class in flavor or appearance, although some of them are very fair for cooking purposes. Mr. S. is satisfied, and so are we, that as good grapes for raisins cannot be produced in Santa Clara county as in the hotter interior valleys, where the season is longer for their growth and ripening, and the atmosphere is more drying than it is here. Our grapes are as beautiful as those grown anywhere, but are certainly not as rich in saccharine substance. They are juicy but tarter in flavor; and while they are superior shipping and table grapes, are not firstrate for curing into raisins. Mr. Settle thinks that sun-drying for raisins is best. One lot of valley muscat grapes, which cost 2 cents per pound, cost, for fruit and fuel, 7 4-5 cents per pound as raisins, without reckoning other expenses. Another lot of mountain grapes—muscats—at 2½ cents per pound, cost in raisins, for fruit and fuel, 8¼ cents per pound. He is satisfied that he could not place raisins cured by the Alden process upon the market for less than 11 or 12 cents, wholesale, at a profit. A grape, to make a good raisin, must be thoroughly ripened on the vine, and be rich in saccharine matter, as well as firm of pulp.

On other fruits and on vegetables the Alden factory is a grand success and a paying concern. Mr. Settle is now running on onions and potatoes, and they are as good as fresh when ready for market. Onions are raised plentifully in our valley, and are afforded by the farmers for 90 cents to $1.00 per hundred pounds at the factory. Ten pounds of onions will make one of dried, worth, by the case, 25 cents per pound net. Onions are difficult to dry, as they scorch easily. Mr. S. thinks of making a run on squashes soon. Dried squashes and sweet potatoes are splendid when made into a flour, for puddings and pies, and, in fact, a hundred different dishes, in combination with other ingredients or alone.

GRAPES FOR CHRISTMAS.

For several years past Mr. Dan Hadley of San Jose, who has a small vineyard in the South end of town has managed to put several tons of fine grapes into market about Christmas time. His method of doing this is extremely simple, and has proved to be remunerative. His vines are trained up high enough so that the bunches of grapes hang clear of the ground. And he does not pick the fruit until he is ready to market it. His system of preserving them is as follows: He takes common barley sacks, rips them open and after trimming the top twigs of the vine so as to allow the sack to be spread evenly over the grapes like a tent, he confines the sack in place by its corners, running branches of the vine like pins through the sack to hold it in place. This sack shelters the grapes from sun, from rain and from frost. Mr. Hadley has used the same sacks for five or six years for this purpose, and some of them are still good for service. During protracted, rainy, wet weather some of the grapes will rot a little, but the loss is generally trifling. The worst enemies to this enterprise are birds that pick into the grapes, causing some berries to rot, which in turn rot others. To prevent this he always leaves a sufficient quantity for the birds on open vines, and with few exceptions they prefer those which are exposed. One important thing in this connection he has observed, and that is, that honey-bees are his friends. They are fond of grapes, making honey out of the rich juice of the fruit, but they only work upon the pecked fruit, not being able to penetrate the skins of sound grapes. The great advantage in this is, that the bees will at once suck the pecked berries dry, so that they do not rot or cause rottenness. Mr. Hadley thinks these facts too valuable to longer keep to himself, and so generously advises us to publish them for the benefit of whom they may concern, which we gladly do.

THE SEASON.

Our first rain this season commenced Tuesday, October 26. The fall was slight in most places. Monday, November 1st there was quite a storm sprung up—enough rain to moisten the surface soil for plowing. It did not commence without warning; yet, some were caught unprepared as usual. We learn that many raisins were damaged. On Saturday, November 13th, after a succession of warm, bright and cloudy days, another warm rain commenced and continued at intervals for several days, saturating the soil finely, and shooting up the green grass and grain, that the first rains had sprouted beautifully. Never has a rainy season commenced here with brighter prospects for flourishing crops. No blighting frosts or winds, but the gentle breath of Spring, fanning the falling leaves and blessing the tender green that carpets the generous and grateful soil.

What is more lovely than our California Winters? Winters only in name; none of the saddening feelings that a sleeping earth bound in icy chains brings to the people who inhabit more rigorous climes. The falling leaves but shelter the springing plants that smile in rain and laugh in sunshine. Our poets need not sing "the saddest of the year," but can tune their harps to gleeful melody, for the ripeness of lucious fruits and the birth of new vegetable life is lavish amidst blooming roses and singing birds.

No wonder that the tide of immigration pours into our State when the cheering reports of friends go back. If our lands now held by thousands of acres by forbidding monopolists and grasping owners, were only so that homes could be secured for the masses, too much could not be said in praise of our blessed country.

The Stringency in the money market and the great fluctuation in stocks and money values are but the natural outgrowths of business conducted on a speculative basis. In all such cases some who acquire wealth without producing it will suffer, but as a general rule, the industrial interests are made to most keenly feel the burdens they have to bear. As nothing is produced without labor, so no non-productive enterprise or speculation can exist without tapping industry for support. Whatever it gives in exchange, be it money or promise to pay, cannot in the end lighten the burdens of labor. Speculation injures industry, while every industrial enterprise of a productive character helps every other. If everybody labored, everybody would be liberally supplied with needed comforts, and luxuries be multiplied, cheapened and within the reach of all. In a community where the majority are non-productive and manage to acquire wealth, as an inevitable result, those who work must suffer in a proportion equivalent to the wrongs committed. The blame does not rest wholly with individuals, but attaches to the artificial system of finance which allows money to be king.

Correspondence.

State Fair Notes.

THE following is the letter of our special correspondent, which reached us too late for our October issue:

The State Fair this year was unusually interesting in some departments, and as disgusting in other respects as can well be imagined. Horse-racing was the principal feature, as usual. It is astonishing how many people, and that of the class who claim to be respectable, are all absorbed in this legalized gambling game. It is a disgrace, not only to the Association upder whose auspices the Fair was held, but to the State. Our Legislature appropriates money ostensibly to encourage agriculture, and here it is squandered among the professional horse-jockeys, adding nothing to the industrial interests of the State in any way. We enact laws forbidding gambling, and then, in the same breath, offer a premium for the most demoralizing and wholesale forms of it. Men and women of all classes of society were engaged in it. Nothing else was spoken of in conversation. Betting and pool-selling was the only theme that seemed to be interesting, and so the city papers are full of it. I am proud of the fact that I am not expected to post the readers of the Agriculturist on the issues of this barbarous sport.

The show of California horses was much larger and finer than ever before. There were on exhibition some horses which showed rare qualities for higher usefulness than mere speed. There were, perhaps, some of the finest stallions in the country here. We have not time to notice all deserving of special mention, so will not attempt to particularize, but are glad to note progress in this particular.

In horned cattle the exhibit was truly good —better than at any previous Fair. Santa Clara county, especially, was well represented. In fact, were it not for our county the Fair would have been little but a horse-trotting show. Some of the cattle we may mention as deserving particular notice. The finest herd was that of Col. Younger, noted for its superior qualities. Charles Clark, of Milpitas, and S. B. Emerson, of Mountain View, exhibit some fine specimens from their Durham herds. Mr. Emerson's bull, "Sheriff," is a beauty. Cyrus Jones, of San Jose, showed only some of his young stock, California bred, but we notice that he walked off with first prizes and sweepstakes.

C. Comstock, of Sacramento, had on exhibition a lot of fine graded cattle. Mr. Bright, of Sacramento, had a herd of Ayrshires which he imported from Massachusetts two years ago, including the bull "Dunbar," four years old, a beautiful animal. Messrs. Powers & Stanton, Sacramento, imported 14 head of Ayrshire cattle last year, which they had on exhibition. Mr. Powers says that his two-year-olds will average one pound of butter a day, and mature cows have made as high as four pounds. Saxe Bros., San Francisco, had on exhibition a splendid bull and cow, hich had just arrived from Kentucky. The bull, "Gay Boy," was sired by "Joe Hooker," who took the sweepstakes in Ohio two years in succession. The cow "Fannie," sired by "Mazourka Lad," took three sweepstakes in Kentucky this year. This importation is a valuable addition to the fine stock of the Coast.

There was only one exhibit of swine. They were *called* Berkshire; but if Berkshires are spotted and have coarse bristles I never knew it before. They belong to M. Sprague.

Branton, of Dixon, had ten pens of fine merino sheep, large and well-covered with fine fleece. S. B. Emerson exhibited Cotswold sheep as fine as we have seen in the State.

The most interesting display in the stockyards was the show of Angora goats. C. P. Bailey, San Jose, had thirteen pure-breds and seven grades. His buck, "Prince of Pine Mountain," a large and most beautiful creature, and the ewe, "Queen of Monterey," were entered for the sweepstakes. The grades are the fourth cross. They have good form and fine, lustrous fleece. They are shown merely to prove that grades can have fleeces that will make mohair. Mr. B.'s stand was thronged with spectators to examine the specimens of cloth, and also robes, mats and gloves, from the Angora Glove and Robe Manufacturing Company of San Jose. The goat men say this establishmnnt will add greatly to the interest of their business. Mr. Bailey sold all the specimens he had long before the Fair was closed. Mr. Gilmore, President of the Angora Goat-Breeding Association, had on exhibition nineteen head of pure-breds. "Hannibal," who took the sweepstakes last year at the Bay District Fair, is a superior animal. The fleece is very fine and glossy. His favorite goat is the ewe, "Cleopatra," which he considers the best he has raised. Messrs. Landrum & Rogers had a meritorious display of 45 pure-bred goats. Chief among them "Hercules" and "Robert E. Lee," both perfect specimens. S. P. Thomas, Auburn, Placer county, had also a good exhibit of twenty head, including the imported buck, "H. W. Beecher." The display of goats was so good that it was no easy task for the judges to award the premiums. There was hardly a poor animal to be seen. The goat men and other patrons expressed themselves well pleased with the Agriculturist and Live Stock Journal.

The exhibit of agricultural machinery on the stock ground was not large. We saw nothing new except a self-dumping horse-rake, which was very simple in construction and seemed to do its work well. The Pavilion contained very little that would be interesting outside of this city and county. Some fine squashes, melons, potatoes, apples, ornamental plants and fancy work are the chief objects displayed. There was an apple on exhibition which was a wonder in itself. It was exhibited by Mr. Wilkins. It measured 25 inches in circumference, and weighed nine pounds, three ounces. The shape round and symmetrical, color a reddish green, called a Sheridan Pippin. Seeds of this apple were advertised for sale at $50 each by J. F. Upham, Sacramento. A Darwin could probably trace its ancestry back to its original melon vine.

Mr. Wm. Squires, an Oregon saw-mill owner, has asked the Centennial Commissioners if they would like to have him furnish for exhibition a fir plank twelve feet wide and 100 feet long, a spruce plank eight feet wide, cedar seven feet, larch seven feet and hemlock five feet, or even larger.

Subscribe for the Agriculturist. Now is a good time.

Letter From Yolo County.

[We owe an apology to our correspondent, Mr. A. R. Woodhams, and to our readers for the mixing up of the types of his letter from Woodland, when putting into the forms for the press. Although publishers are respnsible for everything wrong about a paper, the printer alone, who handled the type, takes the actual blame in this case, as the editor could not know of the mixing till the paper was printed, when it was too late to correct the fault.

As the communication contained valuable information, we reprint in a revised form, and this time, we trust, without serious blunders.]

Eds. Agriculturist and Live Stock Journal:—Woodland is a stirring town of about three thousand people, situated seventeen miles northwest of Sacramento, and on the line of railroad from the latter place to Knight's Landing, and is surrounded by some of the most productive land I have seen in the State; and if not for the heat and hot North winds, I should consider it the Farmer's Paradise. In this vicinity are large bodies of white oak trees, which no doubt gave the name to the town. Shade and ornamental trees do not thrive as at Santa Clara. Live oaks are a rarity.

In the town there are five or six churches, numerous saloons, one college, one fine public schoolhouse with an attendance of about 300 scholars, two newspapers, gas and water works, a grist mill and a large machine shop and planing mill.

ALFALFA.

In this vicinity there are between 2,000 and 3,000 acres of alfalfa, and although many farmers of this State *think* it a poor article for hay, the farmers here *know* by experience that it makes hay of an excellent quality when properly cured. I can hardly express to you the many advantages of these clover fields. Everything seems to thrive on alfalfa. Here are to be seen fat animals, clover-fed. Hogs are kept on it the year round, and a drove of 100 is a common sight. Many alfalfa clover fields this season have yielded five tons per acre, besides a large amount of pasturage; others, three or four tons, besides a crop of seed varying from 200 to 800 lbs. per acre. Alfalfa clover also gives the bee-keeper great advantages. I saw 50 lbs. of delicious honey made in three weeks taken from two hives. Thrashers are now at work on clover seed, but there are many fields that will make another crop of hay in a few weeks more. The beautiful green clover and the delightful fragrance from the blossoms has to be seen and enjoyed to be appreciated. The farmers of this section show an enterprise that might with advantage, be a copy to farmers in other portions of the State. To add to the natural productiveness of the soil, they make use of the waters of Cache Creek for

IRRIGATION.

The ditches are made on the highest land, and the method of watering is by flooding. The land is laid off into convenient levels by dikes several inches high.

If some of our dry land farmers could see the alfalfa clover fields and the vineyards

yielding a third crop they would be converts to winter irrigation at once. And just here I would most earnestly urge my Santa Clara neighbors and people of our beautiful valley to utilize the many streams of water that run to waste even in dry seasons. When that is done I predict a future for our own valley that few persons can conceive of.. As a sample of what water has done near Woodland on

A FARM OF 80 ACRES,

which a few years ago could have been bought for $600, and now owned by Mr. R. B. Blowers. $10,000 worth of products was sold in one season; expenses were $2,000. Another farm owned by N. Wyckoff seemed to be equally productive.

CORN.

Last week I saw on the farm of J. Fowler a fine sight of 70 acres of corn of different varieties, some of it planted the 25th of June and growing from five to eleven and one-half feet high. The soil, with proper cultivation, would produce 100 bushels per acre.

DAIRYING

Is not carried on as largely as it might be, but there is no reason why this county should not be the "Orange County" of the State. D. Farnham is one of the largest and best butter-makers here. He makes about 100 lbs. a week, and for color and flavor it cannot be excelled.

THE WHEAT CROP.

Has been good for this season. Summer-fallowing is in general favor here, lands so treated yielding from 30 to 40 bushels, when winter sown yields from 15 to 25. The gale of last Spring did serious damage to wheat, consequently many are looking for a variety that will ripen after the high winds cease. Proper wheat has been a favorite seed, but its ripening too early makes it objectionable. Club seems to be the choice of many for next season. Land here is worth from $20 to $200 an acre, according to location and improvements.

FARMING MACHINERY.

Farmers are using the best improved machinery. For thrashing, Enrights straw burners are being introduced. Here, also, derricks with horse forks are used with nearly all thrashing machines, also Jackson's self-feeder and elevator; a great labor saving machine. I have seen Jackson's Traction engine used for thrashing, propeled over a rough road and drawing separator, traps wagon, etc. Mr. N. Wyckoff has imported from the East (and I believe it's the only one in this State) a Detrick's Perpetual hay-press, driven by horse-power. It makes compact bales that I have not seen equaled. Ten tons of it can be stowed on a single railroad box-car.

POULTRY.

I have visited the poultry yards of Dr. J. W. Prather, and though his choicest birds were away to State Fair, I saw enough to satisfy me he has very choice poultry. His yards are located in clover, so his poultry have green feed the year round.

RAISINS.

Before closing this I must mention the farm and vineyard of R. B. Blowers. I saw sights there that would astonish even old Californians. Mr. B. has 25 acres devoted to table and raisin grapes, and if wine men would visit his vineyard and see his "lay out" of raisins, no other argument would be needed with such of them as desire prosperity and have the good or their race in view. For bearing, size and flavor of Mr. B's. grapes and raisins, it will be hard to equal them anywhere. I saw vines bearing a second crop that had on at least 40 lbs., ofgrapes! Mr. B. dries his grapes on the ground, but this year he is trying a cement floor in the field. He has 700 yards of this floor already, and so constructed that in case of a rain, water will drain off quickly. I also saw the effect of two methods of prunning of one kind of grape vine. One way caused the vine to be almost worthless as a bearer, the other made the same varfety very prolific. From 120 lbs., of grapes, Mr. B. has made 45 lbs. of raisins.

There again I saw clover fields and the effect it had on stock, especially in its wool and mutton producing qualities on some graded Merino sheep belonging to Mr. B., also some of the get of buck, "Silver Horn." A lot of Merinos imported from Vermont and owned by Mr. George Hammond were very fine. A lamb 7½ months old get of "Vigor" of Ohio weighed 107 lbs. On 10 acres of clover, Mr. B., has had for five months, 150 heads of sheep and 10 of cows and horses, and there will be feed enough for months yet. Mr. B., discovered that cattle and sheep that had access to his grape cuttings—of which they ate freely in the spring—did not bloat, showing, perhaps, that stock running on succulent *clover need dry feed* as well.

A. R. Woodhams.

"Hayseed not all Chaff."

Dear Editor Agriculturist and Live Stock Journal:—I think your article in October number on "Short Weight Cheats," taken from the *Pacific Grocer*, is liable to mislead a stranger to the average "Mr. Hayseed." Most of the butter retailed from the groceries is sold by the roll, the same as soap by the bar, or cream tartar by the paper. So long as this is the custom, "Mr. Hayseed" has the same right to its advantages as he has to the loss of the bar and paper custom or system. It is very proper that "one hand should wash the other." Most of the butter in market is moulded in moulds sold by the grocer to the butter-maker, and if the butter is light the grocer deducts when he buys, and then makes off of his customers when he sells.. "Mr. Hayseed," in this case, is not the swindler. I do not claim that two wrongs make a right, but that established custom is custom. "Mr. Hayseed" should be, as charged, entitled to his part of the benefit. In regard to "short cords of wood," it is impossible to take an honest cord as piled by the chopper, load it on a wagon, haul it from ten to twenty miles, throw it off and pile it up a full cord again. Every stick has shrunk in drying, the bark fragmeuts have rattled off, there is an unavoidable loss in *bulk* for some one to lose, if "lose" you can call it.

In regard to "clods and stones in the baled hay." With the best of intentions on the part of "Mr. Hayseed," it is impracticable to keep them all out. Hay is usually raked and bunched with a horse-rake, the rake gathering all the loose material on the ground. Many a heavy clod is never seen by the raker or stacker; and any one who has seen those fierce, sweaty athletes *baling by the ton*, pitching, rolling, and stamping the hay into the press, knows they have neither time nor inclination to put in or throw out clods; it would not pay them. Some of the last bales raked up round the press contain fine stuff but often *more* actual feed than the long straw bales.

I am writing of honest work only, and wishing to defend an honest "Hayseed" from unfavorable *appearances*. I would not defend any dishonest practice, on the part of either producer or middleman, and should not trouble you with these remarks now if it were not a notorious fact that Mr. Middleman is usually very *glib* in his own defence, and "Mr. Hayseed" is usually stronger in his *spinal column* than in his *tongue*.

Yours for fair play, C. A. W.

Tree Planting.

Now is the time and the season of the year or our farmers to engage in planting trees Our liberal Legislature has proposed to pay out of the State treasury one dollar for every tree planted and living four years after the work is done. This sum will reimburse the farmer for all his time, labor and expense in the undertaking, and he will have the trees clear at the end of the four years to beautify his farm, afford a welcome retreat from the hot Summer's sun to his cattle, and a cool and refreshing shade to the footsore and weary traveler. Besides, it has been demonstrated that when a country becomes treeless, it becomes dry and rainless. The earth becomes parched and the springs dry up; but when the whole face of the country is covered with forests, the rain that descends from the clouds remains in the soil, evaporation is checked and the springs bubble forth their bright and sparkling waters forever. Whole regions of the earth's surface have been rendered rainless by the destruction of their forests. There is no doubt but that the rainfall of Oregon will be materially lessened in the course of time by the great destruction which is now taking place in her immense forests. By a parity of reasoning, it might be greatly increased in California by planting on a large scale, as contemplated by the Act of our Legislature. Every farmer, then, who plants a tree, not only lends a hand to the adornment of the landscape, but assists, by so much, in inviting from the clouds and retaining in the soil that most indispensable element—life-giving water.

[The above, submitted for our editorial approval, meets it with the exception of the old notion about trees influencing the rainfall. We very much doubt any such theory, but are none the less in favor of tree-panting. Plant trees, everybody!]

Gophers and Alfalfa.—One of the most destructive enemies to alfalfa in this State is the gopher. This little rodent digs into the soil and works his way along under the surface from root to root, cutting each one off as he comes to it. The only way to make alfalfa a good success on land where are plenty is to destroy the gophers. This seems to be a very difficult problem. Irrigation, however, is certain destruction to them. To alfalfa irrigation is very beneficial in other ways than killing gophers. Irrigation, then, in such cases works a double benefit, and is doubly important. Where land can be irrigated at pleasure during the year the amount of alfalfa that can be produced is almost incredible. It can be cut as many as six times in a year, yielding as many as two to two and a half tons each cutting. With a good start in the fall, it grow almost as rapidly during the winter months in this State, especially where protected from severe winds, as in Summer. Where land cannot be irrigated, or the gophers kept out in some other way, it has to be seeded every fourth year. As it is thinned out from year to year it is a very good plan to sow some oats or barley each fall, after the first rains, and harrow thoroughly with a sharp-tooth harrow. As the clover grows thinner this will keep up the crop to a paying standard till it becomes necessary to reseed.—*Sacramento Record*.

Irrigation.

Proposed Legislation in Favor of an Irrigation System.

We are glad to observe that public attention is called to the question of a general system of irrigation in this State.

The subject is new to most people, and its very importance to a large portion of the State requires that it should receive a most searching examination. It is certain to come before the Legislature at its approaching session, and we believe it to be of paramount importance. We by no means expect to see any well-perfected and desirable system devised in a moment, and it would be contrary to all our experience in legislative matters if some plans should not be presented which will be full of loopholes for all sorts of jobbing and rascality. Indeed, we are not disposed to deny that in the present state of morals and politics it will be a very difficult matter to pass a law on this or any other subject, in which private or corporate interest will not in some underhand way be made to override those of the public. We do not doubt that irrigation will be made a hobby by designing men that have no higher or better purpose than to plunder the people. If the fact should be otherwise, it will be an isolated case without a parallel in all our past legislative history. But even this danger, evident to every one who knows what influences determine legislation, should neither cause us to delay nor to abandon the attempt to secure such wise and just legislative aid as will give to the farmers of the State an effective and general system of irrigation. Necessity prompts the attempt, and thousands will rejoice if it prove successful. The Santa Rosa *Democrat* thinks that no final legislative action should be taken until the session after the next. It may prove impracticable to do anything even as early as that. The interests involved are so great, the expenditures and the facts required to be definitely ascertained so numerous, that it may take many years to devise a safe and practical system, and carry it into full execution. The history of the immense irrigation works in India will convince any man that the magnitude of the task and the difficulty of the engineer problems to be solved, are not to be rashly encountered. Scarcely any works of human hands, in ancient or modern times, can rival in cost and difficulty the irrigation canals that have been already constructed, and the works which California needs would require to be on a scale no less stupendous. It can scarcely be expected that such a system can be put in full operation before the end of the present century. But knowing all this, we nevertheless desire to see a beginning made. In some portions of the State the work will be simple and not inordinately expensive. We know facts enough already to make an intelligent beginning in the San Joaquin valley.

There are 13,000,000 acres of irrigable land in the Sacramento and San Joaquin valleys and their dependencies. Of this a single corporation (the California Canal & Irrigation Company) once proposed to irrigate 9,600,000 acres, or about 15,000 square miles. We do not advise any stretching of State perogatives or violation of the Constitution, nor do we think that intelligent advocates of irrigation desire any such thing. If we understand what they seek, it is simply to have the lands districted where irrigation is needed, to have power granted to the land holders, to elect Commissioners to act for them as an association, and to issue the bonds of such association, to provide for the construction of the necessary works. The land owners to be liable to taxation to pay these bonds, and the right to use the water, to be free to all taxpayers without further assessment or payment. It seems to us that there need be no delay of two or more years in conferring such rights and privileges as these. The land owners only ask to tax themselves for their own benefits, and to pledge their credit for the means of increasing the value of their lands and the annual profit arising from their cultivation. If there is no constitutional objection, we would certainly desire to see so much done without delay. It would at least serve as a beginning and give the resident of the districts subject to drouth some reason to hope for better times. Irrigation is a matter of State importance, second to none other, and prompt action alone will keep the region west from the San Joaquin from being depopulated. Many have been absolutely compelled to abandon the country within a few weeks, and many more will follow them ere long if there is nothing done for the promotion of irrigation. We think the Legislature may safely authorize a beginning of the work as proposed, leaving it for the future to determine what further legislation may be necessary.—*S. F. Chronicle.*

THE Sacramento *Record* has this to say about irrigable lands in Sacramento county: If the owners of the uplands in Sacramento county, east of this city and lying between the American and Cosumnes rivers, would confer this power upon the State, and expend say $10 per acre, (or $5 per acre might answer) in an irrigation scheme, that entire district would soon be blooming like a rose, and all the people on it might become wealthy for then ten or twenty acres would produce as much as one hundred acres produces now. And the increased crops would pay in two years the entire cost of the scheme.

The Horse.

THE HORSE DISEASE.

THE SAME NATURE AS THE EPIZOOTIC, BUT OF LESS INTENSITY—EAST, WEST AND IN CALIFORNIA.

An annoying epidemical disease, resembling the epizootic in all its symptoms, is spreading rapidly among the horses of this city. Three weeks ago a *Tribune* reporter visited the different street railway stables to learn if this disease, then prevaining in Buffalo, had reached New York in its march eastward. At that time no trace of it had been discovered. It was asserted on all sides that horses were more free from disease of all kinds than they had been since the remarkable attack of epizootic almost three years ago. In June the horses of the Eighth and Ninth Avenue railways were suffering from inflammation of the bowels and pleurisy, brought on by sudden weather changes. Persons who have made horse disease a study, and who are familiar with the epizootic, say that the prevailing distemper is of the same nature, and differs only in its intensity. The horses are taken with a running at the nose, accompanied with a hacking cough and a sore-throat, but seem to lose none of their vitality, and maintain a good appetite. Thus far about 200 hundred horses from this cause have been unfit for work at a time, while at least 12,000 have been attacked. Most of those, however, have been worked as usual, and no aggravation of the disease is expected unless the weather should suddenly become wet and cold.

A *Tribune* reporter called at many railroad and hotel stables yesterday, and learned that the favorable change in the weather since the rains last week and Sunday had greatly mitigated the disease. Friday night, September 10th, was exceedingly cold, and on the Saturday a few horses in the northern and eastern part of the city were taken with the disease. On Thursday, September 16th, said the surgeon of the Third avenue stable, the disease in that quarter of the city became widely prevalent. The horses were taken suddenly with violent coughing and slight running at the nose. The doctors pronounced it epizootic at once. The horses, however, showed no running at the eyes, which looked as bright as usual. By Saturday two-thirds of the horses in the stable were coughing more or less. The Third Avenue Company has at present 1,781 horses at the Seventieth street stables. Not an animal had been unfit for work. Nothing was done except to blanket those most afflicted and protect them from drafts. The surgeon said that ordinary colds usually prevailed among the horses from the beginning of the Autumn equinoxical storms to November 10. He thought the rain of Sunday had increased the malady, but from the appearance of the horses, he believed that three days of fine weather would drive away all appearance of epizootic symptoms. He had received intelligence from Philadelphia, where the horses seemed to be very much affected by the disease, notably in North Eleventh street.

Mr. Tracy, of the Park boarding stables, said he became alarmed on Friday at the appearance of the disease among his horses, and took some pains to inform himself about its spread through the city. In traveling to the City Hall by the Third avenue line, he saw very few horses that were not more or less affected, and some of them were coughing violently. He regarded the disease as epidemic, and, at the authority of Drs. Licntard, Castanach and Nostrid, pronuneed it a mild form of epizootic. On Friday last the disease had not appeared in the Chrystie street stables. On the Saturday following nearly horse in these stables were taken with coughing and sore-throat. All horses in the neighborhood or Central Park, both in public and private stables, are affected. It is obvious, from the way the disease has spread over the city, that there is an infection in the air. The epidemic is thought by many to have proceeded from western cities. Mr. Tracy, as soon as his horses were taken, closely blanketed them, and fed hot mash with a little vinegar sprinkled in the feed. His horses were improving very rapidly.

The Superintendent of the Broadway railway stables said out of 1,200 horses about 900 had had the disease since last Thursday. He considered the distemper epidemic, but feared no serious consequences from it. He said the horses began coughing the moment they left the stable for the open air, and thought that horses in private stables, which were usually weighed down with blankets, were the greatest sufferers from the disease. The change from a warm stable and heavy blankets to the open air was apt to induce the worst symptoms of epizootic. Two or three horses have been seen affected to an extent suggestive of the epizootic days of 1873. The disease has appeared in all of the stables on the avenues.—*New York Tribune.*

The same disease has also appeared in the Western States.

The Cincinnati *Commercial* of a later date, in speaking of the disease says: "It is mitder in form than the disease which prevailed in the Fall and Winter of 1872, and less serious in its consequences. It appeared first about three weeks ago, and many of the horses at that time affected are now over it. The disease is mainly confined to the lungs and bronchical tubes. There is none of the disgusting running at the nose that made the disease of 1872 so disagreeable to handle. The present disease is about the equivalent of bronchitis in the human subject. They are attacked with a cough, the pulse is quickened some fever supervenes and the disease gradually dies away, without dropsy or other unpleasant sequelæ.

Horses on this coast are also affected in many localities. A gentleman in Oakland who owns a fast horse, is down with this disorder says that a little exercise causes great pain in the lungs, which are inflamed, and that violent exercise would cause dangerous conges-

tion of the lungs. Rest with gentle exercise is recommended.

The disease with the horse is analogous to the bad colds now prevalent among our people—accompanied with sore-throat and lung-cough. As complete rest, warmth and light diet is the best treatment for human beings, who soon recover under favorable conditions; so the rational treatment is the best for the horse. Exercise with exposure to drafts of cold air, etc., and harsh treatment is likely to prove fatal. Kind, considerate treatment is always best, and in case of sickness is absolutely essential to perfect recovery.

What a Veterinary Surgeon Says.

Mr. T. H. Larcom, proprietor of the Good-enough horseshoeing establishment of San Jose, also a graduate from a veterinary school and whose opinion is worth something, says that a horse with the epizootic should be carefully blanketed, kept out of all drafts of winds, be fed lightly with good hay and carrots or other vegetables, given no cold water, but all he will drink of water with the chill taken off or tepid water. A fire-shovel full of hot ashes from the stove is good to throw into the water once a day; in effect, it loosens the phlegm and false membrane, which accumulates in the throat, lungs and stomach. A handful of scalded bran is also good to add to each bucket full of water the horse drinks. No other medicine is advised, if the bowles can be kept regular with bran mashes and vegetable or green green feed. Rest to a horse in this condition is requisite to a speedy cure. A little gentle exercise is all that should be allowed and by no means should fast driving or hard pulling be allowed, even for a short time.

These items were given us after we had writtten the few suggestion in the preceding article, but we gladly add them for the better guidance of our horse owners, in the treatment of this prevalent horse disease.

The Dairy.

Making Cheese in a Small Way.

In answer to a correspondent who wishes to know the *modus operandi* of making cheese in a small way, we can do no better than to quote from that world-renowned dairy-man, X. A. Willard, who thus tells how in the *Rural New Yorker:*

Good, fair family cheese can be made with even rude implements and appliances. If nothing better is at hand, a common wash-tub, if clean and sweet, will answer the purpose for setting the milk and working the curds. A hoop must be had from the cooper in which to press the curds. Let it be (for a small quantity of milk) say from eight to ten inches in diameter (top and bottom) by twelve inches high, and fitted with a follower. A very good press can be made in a few hours from a twelve-foot plank and a few pieces of scantling. About a foot from either end of the plank set up two short pieces of scantling five or six inches apart; fasten them firmly to the plank with bolts and pins. The lever may be a joist, say four x six and fourteen feet long. One end is secured by a pin passing through it and the uprights at one end of the plank and set one and a half feet above the bed-piece of the plank. This lever is to move freely up and down between the uprights at the other end, and a weight hung at this end of the lever will give you a press that will do good service. The weights at the end of the long lever are a stone or two from the field. Another lever is arranged for raising the long lever or press-beam, without removing the lever, which, in that case, may be made stationary. The hoop containing the curd is placed on the plank near that end of the lever which is secured with the pin. Blocks are put upon the follower, and the press-beam let down upon them, and in this way the cheese is pressed.

A long, thin wooded knife will do for cutting the curds. A gallon of milk, wine measure, will make nearly a pound of cheese or if the milk is weighed, ten pounds will make one of cheese, and thus the weight of the cheese may be calculated from the quantity of milk in the tub.

The night's mess of milk may be strained directly in the tub, and if the weather is warm a pail of cold water should be set in the tub to cool off the milk and keep it sound during the night. In very hot weather it may be necessary to change the water several times. In the morning skim the cream which may have formed on the milk, put it into the cloth strainer, and pour the warm milk from the morning's milking into the mass, and in this way cream will be in condition to be worked back into the milk. It will be proper to add a word in this connection in regard to having the milk in proper condition when it goes into the tub. In hot weather, and especially in hot climates, care should be taken not to worry or overdrive the cows. They should not be irritated in any way, and they should have an abundance of good water and everything provided for their comfort, otherwise the animals may be in a feverish condition, and yield imperfect milk that may cause trouble.

The night's and morning's milk having been mingled in the tub, and the number of gallons or its weight known, a portion may be taken out and heated in pans over a common stove. The pan holding the milk should be set in another pan holding water or over a kettle containing water so as not to scorch or burn the milk in the pan. Heat the milk and pour it into the tub until the mass indicates a temperature of about eight-five degrees Fahr. by the thermometer, then add a quantity of rennet, (which has been previously prepared by steeping the dry skins of rennet in water) sufficient to coagulate the milk, say in from forty to fifty minutes.

Now put your finger into the curd raise it slowly, and if it readily splits apart, the mass is ready to cut into checks with the curd knife. After cutting into checks two inches square, let it remain at rest ten or fifteen minutes for the whey to form; then carefully break with the hands by lifting up very gently, and when the mass has been gone over, let it rest for ten or fifteen minutes for the curds to subside.

Now dip off a portion of the whey into pans, and heat on the stove in the same manner that the milk was warmed. In dipping off the whey a cloth-strainer is thrown over the tub and the whey dipped from off the top of the strainer, so as not to dip or remove the curds. In the meantime continue breaking by gently lifting the curd until the particles of curds are about the size of small chestnuts or large beans; then pour in the heated whey until the mass indicates a temperature of from ninety to ninety-eight degrees. Do not be in a hurry, but take things leisurely, continuing the breaking or stirring of the curds while the heat is being applied. It may now be left at rest for a half an hour, and then stirred, so that the particles may not pack or adhere in the tub, and this treatment continued until the curd has a firm consistency. Take up a handful and press it together in the hand, and if, on opening the hand it readily falls to pieces, it is about ready for draining. Another test is to chew a bit of curd, and if it "squeaks between the teeth," it is about ready. The mass now will have a slightly acid smell and taste, which is readily distinguished by old cheese makers, but not so readily by the inexperienced; but, to the latter, one of the best tests is to take a little curd in the hand, squeeze out the whey and touch the ball of the curd to a hot iron, then, in removing it if the curd spins or draws out in small threads, it is ready for the whey to be removed. Throw a cloth-strainer over the tub and dip off the whey down to the curd; then put the strainer on a willow clothes-basket, and dip the curd into it. It may now be broken up with the hands, and when pretty dry may be salted in the basket or returned to the tub for salting. Salt at the rate of four or five ounces to sixteen pounds of curd; mix thoroughly, and put to press.

After remaining from two to four hours in press, take the cheese out of the hoop, turn it bottom side up in the hoop and put it to press again leaving it under pressure till the next morning, when it may be removed to the shelf in the dairy room. Very small cheese need not be bandaged. They should be rubbed over with a little fresh butter, melted and applied warm, and the cheese turned and rubbed daily with the hand once a day until well ripened.

Horticulture.

The Gardener's Lament.

Yet none a garden plant
Unless he count the cost;
For there is labor lost,
And late and early frost,
His dreams to haunt.

I planted mine with care,
And soon the young plants grew.
Just then the worms, a few,
Exposed themselves to view
And gathered there.

I watched with anxious care
Each plant and tender shoot,
And dreamed of early fruit;
Alas, worms at the root—
Worms everywhere!

I set my banner there,
And tunnel, dug and bore;
My siege-guns then I lower,
Shotted with hellebore—
Death everywhere.

The slain and wounded lie,
Full twenty thousand killed;
And yet their ranks are filled,
While all are are fully drilled
To fight or die.

My beans and early corn,
My bed of early beets—
These all the cutworm eats.
I'm sick with sore defeats,
And feel forlorn.

And you, who live in ease,
And little care or know
Who wields the spade or hoe,
If things will only grow,
And you have peas,

No need for you to fast.
Let others fight the foes;
Though you must have your woes—
The moth will eat your clothes
And you at last!

—[Worcester Ægis and Gazette.

To Grow Chestnut Trees.—If you want to grow chestnut trees, the fruit must be planted as soon as it is perfectly ripe and while it is in its fresh state. If a few trees only are wanted, plant the chestnut about three inches deep, just where it is desired to have the tree stand permanently. They do better not to be transplanted, and sometimes will not grow. When they reach a proper height the stems can be grafted with any better sorts attainable. But it requires a careful hand to graft the chestnut to insure its growth. When fairly started, the young tree pushes ahead rapidly, and often takes one by surprise in the earliness of its bearing.—*Ex.*

We have in California hundreds of farms, situated in the foothills, which could be made to yield a handsome revenue by setting out orchards of late apples. Late apples always command a good price and are never a drug in the market. Early fruit must be sold as soon as picked, whatever the price; but late or winter apples seldom have to be sold for less than two dollars per box. Besides this, there are many other fruits which are adapted to the foot-hill climate. There is no better vineyard land in the world, and it is surprising that more vines have not been planted in the mountain sections. It is far easier to cultivate grapes on sidling land than to plow and reap grains, and that, too, when the expense of harvesting hilly land is so much heavier than valley land. A few years will probably make a wonderful change in the hills of California.—*Ex.*

Value of Evergreens Among Fruit Trees. —A well-grown evergrgreen tree gives off continually an exodium of warmth and moisture that reaches a distance of its area in height; and when the tree-planters advocate shelter-belts, surrounding a tract of orchard of fifty or more acres, when the influence of such belt can only trace a distance of the height of the trees in said belt, they do that which will prove of little value. To ameliorate climate, to assist in prevention of injury from extreme climatic cold in Winter, and of the frosting of the germ-bud of fruit in the Spring, all orchards should have evergreen trees planted in and among them indiscriminately, at a distance of not more than 150 feet apart. Such a course pursued will give health to the tree and be productive of more regular, uniform crops of fruit.—*Ex.*

Planting Forest-trees.—For the purpose of making tall, limbless trees valuable for timber, close planting is advisable—say four by three feet apart. The larch is planted three feet apart each way in England. In five and one-half years, one-half is cut for poles for hurdle-fence, and in ten years one-half of the remainder is cut for posts. The remaining trees, thus left six feet apart, are allowed to complete their growth.

"What shall I cook?" is a short but vexatious question, engrossing more serious thought probably than any other one question in the world. Many a good and industrious wife can be greatly relieved, and many a farmer's table bless his sight and appetite, by providing now for a good garden. If you love your wife and daughters, do not put it off for money-making enterprises on the farm.

Two Crops in One Season.—The Gilroy *Advocate* is informed that Geo. Headen & Co. of that place, are tilling a piece of land—50 to 60 acres—from which they have raised this year a good crop of barley and a second crop of potatoes. The barley was cut in June and the potatoes planted afterwards. They are now bringing the latter to market. They have realized 5,000 sacks of 100 pounds each, of as fine potatoes as any the country affords. A sample may be seen at the Bank of Gilroy, which weighs 2^{1}_{4} pounds. Of course this is a picked one, but the average is exceedingly prolific.

France, but for whose aid and sympathy given to our fathers a hundred years ago, America would scarcely have been a nation at all, is likely to do herself great credit next Summer at the Centennial, and is to occupy twice the space originally designed for her in the different buildings at Philadelphia.

The Ventura *Signal* tells of a beet weighing over 1,100 pounds avoirdupois which has been grown in Williams' gardens at San Buenaventura. "Beet" this who can.

The Flower Garden.

Gillyflowers.

LD-FASHIONED? yes, I know they are,
Long exiled from the gay parterre,
And banished from the bowers;
But not the fairest foreign bloom
Can match in beauty or perfume
Those bonny English flowers.

Their velvet petals, fold on fold,
In every shade of flaming gold
And richest, deepest brown,
Lie close with little leaves between,
Of slender shape and tender green,
And soft as softest down.

On Sabbath mornings, long ago,
When melody began to flow
From out the belfry tower,
I used to break from childish talk,
To pluck beside the garden walk
My mother's Sunday flower.

In Spring she loved the snow-drop white,
In Summer-time carnations bright,
Or roses newly blown;
But this the flower she cherished most,
And from the goodly garden host
She chose it for her own.

Ah, mother dear! the brown flowers wave
In sunshine o'er thy quiet grave
This morning, far away;
And I sit lonely here the while,
Scarce knowing if to sigh or smile
Upon their sister spray.

I will could sigh, for grief is strong,
I well could smile, for love lives long,
And memory keeps even death
But if I smile, or if I sigh,
God knoweth well the reason why,
And gives me broader faith.

Firm faith to feel all good is meant,
Sure hope to fill with deep content
My most despairing hours;
And oftentimes He deigns to shed
Sweet sunshine o'er the path I tread,
As on to-day, these flowers,

And chose He not a bearer meet
To bring for me those blossoms sweet—
A loving little child?
And child and bonny blossoms come,
Like messages of love and home,
O'er waters waste and wild.

—[All the Year Round.

QUERIES.

1. What will prevent mildew from accumulating upon rose-bushes?

2. How can the parasites which attack themselves to Scarlet and Lilac bushes, and also to some varieties of the Acacia, be best removed?

1. Nobody has yet found out how to prevent or eradicate the mildew on rose-bushes, without destroying the bushes themselves. A gentleman in San Jose who has been trying for years to do so, says he will give $100 reward for a practical method of preventing mildew on roses. This mildew attacks the growing, tender stalks and ends of shoots first, then blights the buds, and finally withers up the leaves without killing the bushes. Carbolic soap-suds, ashes, lime, sulphur, blue vitriol, tobacco, snuff and smoke, hellebore, etc., have been tried in vain; also pruning of root and branch, charcoal about the roots, irrigation and dry culture have been tried with little effect. The Giant of Battles is the variety that appears to be affected the worst.

2. A wash of carbolic soap-suds is found to be efficacious in removing the scale louse. Lime wash or blue vitriol will do it; also tobacco wash and many other things. This is laborious but essential. Where one wishes to destroy the scale "on a large scale," the Babcock Fire Extinguisher, which throws a stream of carbonic acid gas and water is good. In case this is used, a quantity of carbolic acid or whale oil soap should be put into the water first. This will also destroy the woolly aphis in tree tops and other insects as well. A thorough washing in some shape with either of the above named remedies is good for the scale louse.

Now is the season to clean up the flower garden. Trim roses, shrubbery, vines, etc., and remove all decayed stalks of plants. Hoe up weeds while they are small.

Potting Plants.

The mold for potting should be light and loamy, the fertilizing material used being well decayed. If the soil is rich of itself it is better to be either very sparing with the fertilizer, or to dispense with it altogether. In the bottom of the pot place several small pieces of crockery or similar material to assist the drainage; and in setting the plant, be careful to keep it well down in the pot and to press the mold moderately around the roots. The surface of the mold should be about half an inch below the level of the top of the flower-pot. Slips should be planted close to the sides of the pot, and in small pots.

When a plant becomes pot-bound, that is, when the roots become matted around the sides and bottom of the pot, the plant after it has ceased blooming should be re-potted in a larger pot. It is not necessary to remove any of the mold from the roots, but simply to fill in the space in the large pot with new and rich mold.

Plants kept in the windows should be turned every morning, or the light, striking one side only, will draw the plant to that side so that all its branches and leaves will turn towards the window. The water in saucers should never be applied to the plants. In cutting slips of any plant always choose the youngest branches, and cut off the slip at a junction of a joint or leaf, since the roots shoot more readily from the joints. If you follow these directions, and put sufficient sulphate of ammonia to just taint the water applied to your plants, you may cultivate with success almost any plant, even though you are an entire novice.—Scientific American.

How to Sow Small Seeds with Success. | Novices in floriculture make frequent failures with minute seeds, like those of the Lobelias, the Mimulus and the Calceolaria, and even experienced florists do not always succeed with every sowing, as such seeds are very delicate and germinate only under the most favorable conditions. Have the soil in the pot, pan or box—a shallow box is best—composed of leaf mold and clean sand, two parts of the former to one of the latter, sifted, or otherwise made very fine. Make the surface even and smooth and press slightly; then sprinkle it by holding a wet brush over it and drawing the hand across the bristles so as to throw a fine spray upon the soil. On this prepared surface sow the seed, and scatter over it the finest possible sprinkling of fine clean sand. Now cover the pot or box with a pane of glass, and keep it in the shade, watering, when necessary, with the spray from a brush, as before directed. The soil must not be permitted to get dry, nor must it ever be deluged with water. If the seeds be sown, as is generally the case, on a loose surface, and then watered with a watering pot, they are mostly carried down with the water so deep into the soil that it is impossible for them to germinate.—Rural Carolinian.

Washing House Plants.—Have a large pail or tub filled with warm soapsuds. Then spread the fingers and palm of the left hand over the soil in the pot, turn the branches topsy-turvy into the warm suds, swing the plant briskly in the water till every leaf has become completely saturated, then put it through a pail of clean water and rub each leaf with the thumb and finger. Give it a good shake, and when dry return it to its place in the window. The leaves of a plant are its lungs, each leaf being furnished with hundreds of minute pores, whence the plants breathe in carbon and exhale oxygen. The perspiration of plants is said to be seventeen times that of a human being. Many plants never bloom on account of the accumulation of dust upon their leaves. A plant too large to lay down in a tub may be syringed and each leaf rubbed with the finger and thumb, which are better for the purpose than a brush or cloth.—Land and Water.

The Boston *Commercial Bulletin* writing of the trade in flowers, says: The great specialty of Boston is roses, which are not only varied in sufficient quantities to supply the home demand, in even the busiest season, but are sent to New York in large bulk, probably half of the immense number sold in New York coming from Boston. Other specialities are lilies-of-the-valley and carnations, which are grown in immense numbers by our leading florists; while successful attention is paid to all varieties. The New York specialty is tube-roses, and that of Philadelphia camelias.

Thanksgiving.—Governor Pacheco has issued a proclamation for Thanksgiving, November 25th, the same day as fixed by the President.

Household Reading.

Chats With Farmers' Wives and Daughters---No. 10.

BY "JEWELL."

Economical Young Women.

THIRTY-one young ladies in Warsaw, Kentucky, have signed a new kind of pledge, which reads:

We, the undersigned ladies of Warsaw, desiring by our example to promote economy and to discountenance extravagance, and thereby lighten in some measure the burdens of our husbands, fathers, sons and brothers, by prudent retrenchment in our household expenses therefore, pledge our words of honor, each to the other, that we will not, during the period of one year from the 1st of May 1875, purchase any material for wearing apparel, the cost of which shall exceed twenty-five cents per yard. And shall further promise to observe a strict economy in all our household purtinances, and cheerfully add by those delicate sacrifices to the general stock of home comforts—too often dispensed with for the frivolous outside adornment of the body alone.

Now that has the true ring to it and is just what should be done, either singly or in numbers, by our women of California, whose expenses for dress and useless fiuery astonishes the world. For we have no aristocracy here, *compelling* a certain style of court-dress and the like. No, our free country is "governed by the people and for the people" they say. I should judge so indeed, by a peep into fashionable society and its devouring, absorbing, expenditures for dress and style! No poor girl, however refined or delicate her organization, however intelligently endowed, or lovely in face and form, can command respect, or enter society of refinement and culture or wealth without *money*, in her own right or her family. She must dress well or wealthy people will not notice her—save with a pitying nod of recognition—and to such an extent is this carried that our women of slender incomes, and moderate brain capacity, find no time for much else besides keeping the household machinery running and planuing how to provide against the inevitable wear and tear of clothes for themselves and girls—if they wish to be thought *respectable* even.

Now I ask. is this right, is it ennobling to the race, and are we making the most of ourselves and girls by so doing and living? While I admit the importance of dress from a physiological standpoint, an economical standpoint and a becoming standpoint, I cannot for the life of me see why our social position should be measured by our appearance in dress. When a lady in her silks and velvets receives more attention and courtesy from the dry goods clerk, or the judge on his official bench, than the same lady in a simple calico, (which is true, I have it from good authority) it is about time to look at this question and endeavor if possible to overcome its evils. If our women are to become useful and healthful members of society—earning a living and a reputation among men—they must not be cramped with the trailing dress skirt, the life destroying girting of the waist, and in fact the all absorbing thoughts of what to wear, how to look best, &c. Our boys are not troubled in that way, and though often careless, are still respected. I often ask myself, are we mothers to blame? for in spite of our example and precept, our six and eight year old girls *will* catch the prevailing spirit of the age and beg for trailing skirts, and show every sign of demoralization in dress—even in play. My only hope then is in combining our strength by numbers and do exactly as the Kentucky ladies are doing, and my word for it, the husbands, and fathers and brothers would soon feel ashamed of *their* many useless expenses too, and give up smpking, chewing and drinking, and join in the general desire to save for some good worthy purpose. Only think of the money, time, health and self-respect that could be saved for the adornment of home and culture of mind by so doing!

Grandfather's Letters---No. 2.

Who hath not loved, hath not lived.

Dear "Jewell" and "Esmeralda:",—I see my former communication was not consigned to the waste-paper box by the editor, and am I to infer from that that he and you want something more from Grandfather to criticise?

If the subject is not as great a success as it might and ought to be, you cannot but observe there is no danger of it's running out and becoming extinct. The coming-in generations are the same in this particular as were the generations thousands of years ago, in spite of any and all adverse circumstances, and the going-out generation, who have had experience, are no way loth to try the old subject over again. Since, then, it is a fixed fact that it was, is and always will be, it remains for us to make it a *success*, and a good, firstrate one, the best way we can. To this end, I shall adhere to the *abnegation plan* I started with, and say to myself, were I on the point of starting again on life's great journey, think, *think*, THINK. Yes, we may well think thrice and think always when another's happiness is committed to our care, dearer than our own—think what her temperament and disposition are—think what are her likes and dislikes—think what she has given up to give herself to me—and above all, to so think as to have such a perennial flow of love, as to make *self forgotten* in favor of her whom I have chosen.

To do this we must *habitually* feel our great responsibility, habitually feel, how should I demean myself by a hasty, ill-tempered word or unkind look, habitually feel the importance of keeping up that suavity of manner, polite, courteous demeanor, so agreeable to all. And are w eto suppose it to be less so to her whom we have chosen above all others to be in daily contact with? With some all this seems to flow forth spontaneously, while with others it requires a good deal of careful and continuous cultivation. I take it we shall all be the better for a little timely thought on the subject.

Ah, this love principle is the fountain from which should flow that which will ever make it a success. This abounds at and previous to marriage; and here again I appeal to the sterner sex, if he is not the first formation party to its loss by indifference or neglect, maybe for want of thought or knowledge? We make a great mistake in supposing that all or the chief part is accomplished when the object of our affections is "secured." No. Then is but the beginning of the work to make it a life success. Then comes the *thinking*, the *doing*, the abnegation, the earnest effort to *keep* the love principle to its full height, and ever have it go on increasing. So it may, but not without knowledge, thought and care. Indeed, without these, what can be accomplished in any departuent of life? To me it seems most strange that this, of all subjects the most important, should be entered upon in so much ignorance and want of thought and care. Not that we can expect, in the present condition of things, that perfect success you would desire. But I do contend the stronger sex should be the leaders in the right direction. Alas, they are too often the reverse. But in these things there is no one a more thorough co-operationist than

GRANDFATHER.

Domestic.

About Husbands---To the Gals.

BY JOHN G SAXE.

A MAN is generally better satisfied when he has a good dinner upon his table than when his wife speaks Greek.—Sam Johnson.

Johnson was right. I don't agree to all
The solemn dogmas of the rough old stager:
But very much approve what one may call
The minor morals of the "Ursa Major."

Johnson was right. Although sometmen adore
Wisdom in woman, and w th wisdom cram her,
There isn't one in ten but thinks far more
Of his own grub than of his spouse's grammar.

I know it is the greatest shame in life;
But who among them (save, perhaps, myself,)
Returning hungry home, but asks his wife
What beef, not books, she has upon the shelf.

Though Greek and Latin be tha lady,s boast,
They're little valued by her loving mate,
The kind of tongue that husbands relish most
Is modern, boiled and served upon a plate.

Or if, as fond ambition may command,
Some home-made verse the happy matron show him,
What mortal spouse but from her dainty hand
Would sooner see a pudding than a poem?

Young lady, deep in love with Tom or Harry,
'Tis sad to tell you such a tale as this;
But here's the moral of it: Do not marry;
Or, marrying, take your lover as he is—

A very man, with something of the brute,
Unless he proves a sentimental noddy,
With passions strong and appetite to boot—
A thirsty soul within a hungry body.

A very man, not one of natures clods,
With human failings, whether saint or sinner,
Endowed, perhaps, with genius from the gods.
But apt to take his temper from his dinner,

Familiar Talks---No. 4.

BY SNIP.

GOOD LIVING.

DEAR AGRICULTURIST:—One of my neighbors, a farmers's wife, sets her supper-table to suit me exactly. Tea, bread and butter, fruit and plain cake or cookies. Sometimes honey, of which the children are very fond, takes the place of fruit. Never, at any time or under any circumstance, does she put hearty food on the supper-table. The children have their supper by five o'clock, are in bed early and are as healthy as one could wish for, while both father and mother are delicate. "I intend, if possible, to enable my children to avoid the suffering I have been obliged to endure," she said to me one day. I think she is right in maintaining that light, early suppers will form an important part in

the success of this resolve. Dr. Hall says that nothing should be placed on the tea-table but bread and butter and tea, and advocates letting the tea alone, or substituting some other drink less injurious in its effects. So far as my observation has gone, I find that in families where children are allowed to eat meat, potatoes and other similar food, they, as well as the older members, oftentimes fretful when they get up in the morning. If such food is placed on the table and partaken of by the elders, it is difficult to prevent the children from following the example set before them. The lady referred to above said that when first married her husband wanted hearty food at night, but after reasoning the matter, he yielded to her ideas on that subject. There is not a harder working man in the State.

Another neighbor places upon the supper-table such food as is found upon the dinner-table. Often roast mutton or beef with all the accompanying dishes are eaten in the evening, The parents are fretful, impatient and quick-tempered, and often complain of not sleeping well; the children are no better off. Can you see the difference and the reason for it? The wife in the latter case is anxious to have only light articles of diet on the table in the evening, but her husband says he cannot work as hard if he does not have hearty food every meal. He does not work half so hard as the first mentioned gentleman. Wonder how he can stand so much hard work. I feel like telling him to read Dr. Hall's "Health by Good Living." I suppose he, like many others, would pronounce it all a humbug that any one could work hard on lighter food than is usually found on a farmer's table. We often have made our supper all of oat-meal or graham flour hasty pudding and milk. Corn-meal during the warm weather is not so good. I am reminded by the above that several who do not like graham bread very well think better of it when made as follows:

NICE GRAHAM BREAD.

The batter is mixed with half white and half graham flour, and kneaded out with white flour. I believe this is the way it is made at Dr. Jackson's water-cure establishment. I like better to make the batter with graham flour entirely and then knead out with white flour.

Not long ago a lady friend gave me a cooky to taste, telling me it was made with graham flour. It would hardly suit the taste of an epicure, but I thought it very good; a little dry, perhaps, but healthful. She told me she often made ginger-bread with this flour. I do not know if that would be good or not, but I *do* think that graham bread should be found on the table oftener than it is.

First Letter.

BY DUSY DEE.

I never wrote anything for a paper in my life, but I feel so interested in the California Agriculturist, that I want others to write, and if all hold back because they never wrote before we should have too few new hints. I think almost anything one can say upon

PRACTICAL SUBJECTS

Interesting; especially about children—their management, clothing and food. I look for every suggestion with interest, and have no doubt many others do the same. Mothers and housekeepers could send forth many valuable suggestions through the columns of the Agriculturist, and do a great deal of good.

I see several letters from the little folks. I read them to my little ones, who are too young to read, and they are highly pleased.

Now I must give "Snip" a hint about what to do for

VERMIN ON CHICKENS.

I have used sulphur and almost everything on my chickens, and I do believe there is no such thing as getting entirely rid of vermin on them. I find the best thing is tobacco. I sprinkle it thickly on all the nests, and I find wherever it is there is no vermin. I also sprinkle it wherever a hen hovers her chicks at night. I think a good strong wash made of it and applied to the roosts and around in the cracks and on the floors of the chicken-house would be beneficial, though I have never tried it. My husband says the chickens use more tobacco than he does, and I venture to suggest it probably does them more good than it does him.

A Few Suggestions and Recipes.

Canning Grapes.—I have been canning some mission grapes, and a little care has made them quite eatable. I put in considerable sugar, cooked them quite a while, then skimmed nearly all the seeds off and feel repaid for my trouble.

Grape Pies.—The next time you make grape pies put a large tablespoonful of flour for each pie into the fruit before putting it into the pie-plate.

Canning Quinces.—I hardly ever cook quinces till done when I put them up, because it takes so long. If they are cooked thoroughly when canned, they should be boiled in clear water until nearly done. Then put in the sugar and boil till the fruit is a delicate pink color. Apples or pears are nearly always canned with quinces, but we prefer them separate.

Quince Jelly.—To make this I use only the skins and cores. Boil them in clear water—a pint of water to a pound of fruit—until perfectly soft. Drip over night and put a pound of sugar to a pint of juice. Do not put the tin covers on your jelly glasses till the jelly has formed. Snip.

Grape Jam.—Mrs. W. R. Patten and Mrs. S. P. Hollengren, of Dry Creek, have been very successful in making grape jam from the following recipe: Stem enough grapes to make five gallons of juice—about 100 pounds will be sufficient. Squeeze out the juice through a colander, and then boil it slowly till it is reduced to two and one-half gallons. These operations will take one day. Then take the same amount of grapes and boil them in another vessel till they burst open and the seeds settle to the bottom. Pour off into the first vessel, being careful not to let the seeds escape. Boil the mixture two days. This jam will last for years, improving with age.—*Russian River Flag.*

Unfermented Wine.—Various churches in this country are introducing unfermented wine to take the place of the fermented, commonly in use for church purposes. The *Journal of Applied Chemistry* describes the method of manufacture as follows: In order to prepare it, the grapes should be allowed to thoroughly ripen. They are then picked, and the stems and all green and rotten grapes removed. The grapes are then crushed and pressed in the usual manner. The juice may be put directly into bottles, or it may first be concentrated somewhat by boiling and then bottled; in either case the bottles are put in hot water and brought to the boiling point, where they are maintained for half an hour. At the end of this time remove them from the fire and cork them tightly, while still hot, wiring in the corks. Then replace them and continue the boiling another hour. Glass bottles are better for this purpose than tin cans, though the latter may be used. An analysis of a specimen prepared in New Jersey gave the following result: Alcohol, none; sugar and extract, 23,00; ash, 40; water, 76,00—total, 1000,00. This had probably been concentrated somewhat before bottling. The flavor was fine. Some acid tartarate of potassium had crystalized out.

We have examined grape juice put up the same as fresh fruit is put into glass bottles and jars. It keeps equally well and is excellent to use as sauce in cooking or with other fruit, or as a drink. We every season put up several jars of fresh grapes for family use and like them altogether better than the juice separately. Tartarate of potassium always collects in crystals on bottom of the bottles and jars both of fruit and juice.

Coal oil lamps will be much safer to use, if the bowl is loosely filled with raw cotton or tow before putting in any oil. In case of explosion or falling on the floor, the burning fluid cannot fly all over everything.

Always fill a coal oil lamp every day before using. The bowl should never be allowed to get empty and be lighted in that condition, for the vacant space is always full of explosive gas.

Never, under any circumstances whatever, try to kindle a fire by pouring coal oil into a stove from a can. Thousands of persons have been burned to death in this way, and still the papers chronicle other victims to the actice.

An egg-producing feed for fowls, highly recommended by a fancier who has tried it, is wheat and white peas, ground and mixed together as stiff as possible the night before and used only as a morning feed.

As a drop of water falling from the house-eaves weareth and holloweth the hard stone, **not by** force, but by often falling; even so a scholar proveth learned, not by power or strength, but by much diligence and great reading.

The fact that the foot hills and some other portions of California are well adapted to the cultivation of the sumac tree is attracting attention, the leaves of that tree being an article of commerce, as they are valuable for tanning purposes.

A benevolent gentleman from Vermont applied to a Boston gentleman for aid in sending missionary to Turkey. The reply was as follows: "I have invested much in Vermont securities, and lost many thousands by the acts of your railroad men, sustained by the people and the courts. I have also lived in Turkey, and had much intercourse with her people. I would far rather give my money to send Turks as missionaries to Vermont."

The *Iowa State Leader* tells a story of a well known life insurance agent, who approached Hammond, the revivalist, on the subject of insuring his life. Hammond said he could not afford to turn his attention to such a temporary and worldly subject, but if the agent could insure his soul it might be worth while talking. The agent slowly shook his head and said it was impossible; his company did not carry any fire risks!

Now that the evenings are getting longer, it is a good time to discuss the merits of the different agricultural papers and select the best, and to urge one's neighbors to subscribe.

Hygienic.

My Neighbor's Baby.

CROSS in my neighbor's window,
With its drapings of satin and lace
I see 'neath its flowing ringlets,
A baby's innocent face.
His feet in crimson slippers,
Are tapping the polished glass,
And the crowd in the streets look upward,
And nod and smile as they pass.

Just here in my cottage window,
Catching flies in the sun,
With a patched and faded apron,
Stands my own little one.
His face is as pure and handsome
As the baby's over the way,
And he keeps my heart from breaking
At my toiling, every day.

Sometimes when the day is ended,
And I sit in the dusk to rest,
With the face of my sleeping darling
Hugged close to my lonely breast,
I pray that my neighbor's baby
May not catch heaven's roses all,
But that some may crown the forehead
Of my loved one, as they fall.

And when I draw the stockings
From his little weary feet,
And kiss the rosy dimples
In his limbs, so round and sweet,
I think of the dainty garments,
Some little children wear,
And that my God witholds them
From mine so pure and fair.

* * * * * *

May God forgive my envy,—
I knew not what I said;
My heart is crushed and troubled,
My neighbors boy is dead!
I saw the little coffin
As they carried it out to-day;—
A mother's heart is breaking
In the mansion over the way.

The light is fair in my window;
The flowers bloom at my door;
My boy is chasing[the sunbeams
That dance on the cottage floor.
The roses of health are blooming
On my darling's cheek to-day.
But the baby is gone from the window
Of the mansion over the way.

Two Ways of Feeding Our Babies.

BY "JEWELL."

The natural is the best way of course; with the mother's milk—and yet I have seen more than one bottle-fed-baby that surpassed in appearance and healthfulness, the breast-fed one—simply because the latter child was fed at any time when it was handy, or the child cried for it; the mother being of the *constitutionally tired* sort, weary with work and worry—and the poor babe living on tired, sick milk, had an old, careworn look on its face—while in the other case, baby was fed *regularly*. Ah mother's, remember *that*, every *three hours*, and on healthy, strong cows milk, no sugar, no water—nothing but pure milk; and all night without any, after baby was a few months old; for it is by habit that our infants learn to nurse all night—a torment to themselves and parents.

Dr. Fuller Walker of New York says: "Undoubtedly the gravest error committed by parents, is in the matter of giving food to their children. I find it almost always the fact that a child suffering from *inflammation of the bowels*, has been fed (if it is dressed right) with corn starch, coffee and tea, some upon milk, bits of bread, meat cake, and a bit of everything there is going about the house. Not more than ten cases out of the 200 occurred in infants below the age of six months, and not more than twenty-five in children over three years. These facts show that bowel complaints commence in children from the time those having charge of them, begin to stuff them with a variety of food, much of which is totally unsuited to their little stomaches and tender bowels."

The other day, I was wondering why it was that so many women of the present day cannot nurse their babies, but use bottles and cows milk. To such an extent are they used, that the trade in bottles and fixings thereto, is an important one—and seems reduced to perfection almost; well, I asked myself, if it would be a type of the "coming woman!" And would the future, by opening its college doors to her, its many avenues of trade, making her equal before the law and giving her equal power in politics through the mighty ballot, was all this to be bought at the expense of her dear privilege of nursing and rearing her own children? If so, it were a dear price to pay, and I would say, keep your ballot and man's government, rather than ask *me* to pay so much for so little in return. But what is the truth regarding the mothers of to-day. Surely it is *natural* for her to nurse her children. Something is wrong if she does not. If we look far enough into her habits of life and condition of health, we will find errors existing, sufficient to cause the evil. Then mothers and daughters, let us study to know ourselves, and by living in accordance with nature's laws, return to the more natural condition of womanhood and the nursing of our own babies.

How Agnes Rears her Baby.

DEAR EDITOR AND READERS OF THE AGRICULTURIST:—There is so much truly valuable reading in the last number of our paper that I feel like sending you a few lines appreciative, not yet knowing what will be the nature of my article.

It would seem that the intellects of our contributors had been whetted for the occasion, their thoughts shine out so bright and clear. There is "Grandfather's Letter;" the columns for the "Boys and Girls," quite amusing—particularly the Little Folks' Dictionary. Then the letters from our lady friends: "Jewell," whose thoughts are always elevating and enlivening, has been more lavish than usual, giving us two chats in one visit. And here, I believe, is my subject—the talks about babies and baby-dressing.

I have put some hints, which I have gathered from "Jewell" and other like sources, into practice in the rearing of our last baby, who, ten months old, is now

SWEETLY SLEEPING BY MY SIDE.

And can assure you I thus far feel well repaid for doing so. Many times a day I call her Rose-bud, Peach-blossom, etc., for her clear, lively, healthful appearance suggests just such names. She has

A DELICATE, SICKLY MOTHER,

And has consequently been fed from the bottle since three weeks old. As *I* have been benefitted, so may others be, if I tell you just how I have cared for her. It has been done with my own hands since she was one week old; for I had great faith in the anticipated course, and was determined it should be carried out to letter, and must say I am encouraged by a spirit of triumph thus far. She has been dressed according to

"JEWELL'S" APPROVED STYLE.

In long-sleeved flannels. When changing the outside plaid flannel wrappers for white muslin, I add an extra soft flannel under-garment. Then baby takes no cold. I like to see babies in white as well as any one, but prefer the comfort of the child, and would as soon think of keeping myself in white. The only objection to the plaid flannels is that they shrink; but as a substitute there are pretty shades of waterproof, which, when trimmed with something bright are very useful and not out of taste, when we consider the benefit.

Now for the feeding, which is no less important. Although there is much said and written against the

NURSING BOTTLE,

I speak in its favor. It is better to have two for use. I prefer those with rubber and glass tube, with these cone brushes for cleansing; but the little brush for cleansing the tube loses the bristles, and is, I think, unfit. I therefore picked the bristles from the wire and substituted a piece of fine sponge. A piece on each end of the wire is good. you will find—one quite small, the other larger. I separate the tube into its parts and cleanse it, with the bottle, thoroughly once or twice a day.

PREPARING THE FOOD.

At first I used clear, sweet milk heated to blood heat, without sugar or water. At times this would be too constipating. Boiled milk would be more so. Then I must look for other food for her, for baby must have no medicine. Indian meal was suggested to my mind. I put a few spoonfuls to soak in water over night, next morning stirred and strained through a perforated tin strainer, boiled in a smooth porcelain kettle (kept for the purpose as baby's taste is delicate), added a little sweet milk and fed from the bottle through the day. This has prevented constipation.

For three months past her food has been prepared for the daytime in this way, alternating wheat-meal, oat-meal and corn-meal, without sugar, only a little sweet milk. Our little calves are fed on milk, grains, etc., without sugar, and they get their teeth without being sick. Our little girl has six teeth, has had no diarhœa, asks not to be held through the day-time but amuses herself with plays on the floor and sleeps. Has done all her

SLEEPING OUT OF DOORS

Since two weeks old, except in stormy weather. Sheltered from the wind, her sleeps have been from two to four hours in length.

Another item must not be left out—I commenced feeding her not oftener than once in two hours when awake. A few days care will regulate this, and attention to it will regulate the entire habits of the child. Since six months old she does not take food inside of three hours. Each day she has had

A FULL BATH

In tepid water. On taking her from the tub she is wrapped in flannel or shawl for a few minutes to prevent chilliness and produce an even circulation, then rubbed gently and dressed. As cold weather advances may bathe her less.

I do not write this to boast of our baby

over others, but to uphold the system of

REARING CHILDREN WITHOUT MEDICINE,

And to say, that if a child can fare thus well in the hands of a mother whose nervous system has been a wreck since the birth of her first child twelve years ago, what may not you well mothers do? AGNES.

Stock Breeder.

Semi-Annual Convention of the Shorthorn Stock Breeder's Association.

AT the last meeting of the Semi-Annual Convention of the Shorthorn Stock Breeders Association of California, Mr. Cyrus Jones, President was in the chair and Mr. Bridgeford acted as Secretary, the following business was transacted:

A Committee on resolutions on the death of G. N. Sweezy, a member of the society, was appointed, consisting of Messrs. Overheizer, Younger and Quinn. The Committee subsequently reported the following preamble and resolutions which were adopted:

WHEREAS, We have learned with much sorrow of the death of one of our most valued members, Mr. G. N. Sweezy, who departed this life since our last meeting, He was an early pioneer, grew up with the country, and was truly devoted to the interests of his adopted California. His enterprise in planting out the semi-tropical fruits, that were beginning to realize his most sanguine hopes; his ardent devotion to and admiration of the Shorthorn; his skill in breeding and feeding them; the splendid displays he has made for years at our State fairs; his manly and honorable competition, shows that he was imbued with the great interests of the country. Well we do remember the eloquent and forcible speech he made at this place one year ago, to harmonize and foster the interests of the Shorthorn breeders.

Resolved, That in his death we have lost a valued friend, and that we send our condolence to his stricken wife and children. Peace to his memory.

Resolved, That the President and Secretary forward a copy of these resolutions to the bereaved family.

The following gentlemen were elected members of the Association: M. B. Sturgiss, Centerville; E. Fore, Princeton; L. W. Shippen, Stockton; F. D. Brown, Haywood; B. Bates, Courtland; E. Comstock, Sacramento; A. J. Scoggins, Colusa; E. G. Weston, Folsom; E. A. Bridgeford.

Colonel Younger was then introduced, and delivered the semi-annual address. This address treated of stock-raising entirely. The following resolutions were passed:

Resolved, That the thanks of this Society be tenedered to Colonel Younger for his able address on Shorthorns. We commend it to the people of California as embodying much practical and useful information, and especially to the young breeders. We also thank him for his devotion to our interests as a member of the State Agricultural Board; his uniform attention to all our wants, and his manly stand for our rights. In him we feel that the stock breeders of California have a true representative.

Members and visitors, and breeders of other kinds of cattle than Shorthorns, were then called on and addressed the Society on subjects of interest to the Convention. Among thme were Messrs. Jones, Quinn and Wicks.

The question of having an annual grand cattle sale and exhibition was discussed, and it was finally resolved to hold it at Agricultural Park, Sacramento, on the third Thursday of April next.

The President and Secretary of the Convention were directed to prepare a catalogue of all the stock to be sold at such exhibition. The Convention adopted the following resolutions:

Resolved, That it is the desire of all the exhibitors of shorthorn cattle at the State fair for the Committee to make known their decision by tying on the ribbon and declaring the winner at the time of decision.

Resolved, That the thanks of this meeting be tendered to the reporters of the *Record-Union* and *Bulletin* for the interests they have taken in our meetings.

The Convention then adjourned to meet in San Francisco, April 1st, 1876.

"Foot and Mouth Disease" Among Our Cattle.

Says the Indiana *Farmer*: This disease which has prevailed more or less in England for several years, and is now sweeping off thousands of cattle there, it has made its appearance here. The Jersey herd or F. M. Churchman, of Indianapolis, has been attacked with it, and one animal died with it a few days ago. Animals affected with the disease show profusive saliva, and the feet are exceedingly tender.

In England where it has longest prevailed the disease is found to be very contagious, and a separation from the other animals should be promptly attended to. As disinfectants, camphor and carbolic acid is recommended. The feet should be washed with a solution of one part of this acid to ten parts of water, and the mouth and nostrils with a warm solution of one part carbolica cid to thirty parts of water. This is donewith a syringe.

So fatal and to such an extent is the disease prevailing in England, that a meat famine is feared there. The cattle in the western coast is more or less affected, and the strictest surveillance prevails over all stock imported into England.

The greatest care should be taken among our stock men to separate the affected animals on the first appearance of the disease. The remedy given above has proven the best that has been tried, and if administered in time usually cures.

The *Farmer* in an article on the cattle disease in England says the number of cases for the quarter ending the 16th of October, is as follows: In Somersetshire, 83,000; Gloucestersetshire, 44,000; Cheshire, 50,000; Dorsetshire, 48,000; Oxfordshire, 35,000; Warwickshire, 33,000; Norfolk, 31,000; Cumberland, 26,000. Throughout England and Wales there were for the same time over 500,000 cases.

MRS. JONES did not interfere when Jones bought a farm, but when he talked about stocking it, she put in a strong plea for the new stripped pattern.

AMERICAN SHORTHORN HERD BOOK. The time for receiving pedigrees for the American Shorthorn Herd Book, vol. 15, has been extended to December 1st. Address the editor, L. F. Allen, 1192 Niagara street, Buffalo, New York.

SAYS the Fresno *Expositor*: "Cattle in the swamps are said to be in a very bad condition. The feed is very short, and stock poor, and in consequence lage numbers are dying. They get mired in the water holes, and are unable to extricate themselves. The worst time has not yet arrived: After the rains commence, the loss is sure to be great."

Live Stock at the Centennial.

A happy solution has been reached of the troublesome problem how to provide adequately for that department at the International Exhibition which comprises horses, mules, horned cattle, sheep, swine, etc. It was manifest that these could not be accommodated in the vicinity of the Agricultural Building at the Exhibition, or within the Park enclosure, since, in the first place, the only available drainage of any such tract must be into the Schuylkill at a point above the Water Works of the city and of the Exhibition; and next, the area of disposable ground in that locality is wholly unequal to the magnitude of the live stock exhibition to be provided for.

In this emergency the Board of Finance have been fortunate in leasing from Pennsylvania Railroad Company the stock-yards, above the twenty-two acres in extent, which are now used as drove-yards by that company but from which they intend to remove in December next, and which are situated upon the south side of its main line of tracks between Belmont avenue and Forty-first street, within a few hundred feet of the principal entrance to the Exhibition Grounds. This ground is passed by street railways on both of the bounding streets, as well as by the Pennsylvania Railroad, which will erect a depot upon it for passenger accommodation, and has already sidings and platforms within the enclosure for the unloading of animals, so that these can be brought by rail from any point without transshipment. The existing shedding will be cleared away, and the whole surface handsomely renovated and supplied with stalls of a convenience and neatness unusual at live stock exhibitions. Many of the important preliminaries are already provided, since, in addition to the essential railroad facilities already mentioned, water is now distributed throughout the entire tract by service pipes twenty-five feet apart; thorough drainage can be secured through the adjacent city sewers; much of the surface is paved; large numbers of neighboring sheds and barns provide sufficiently for storage of hay, grain, etc., and hotels hard by, formerly used by the drovers, will accommodate exhibitors and their agents. When it is added that the area of the land is such as to admit the construction of a half mile track for the exercise of the animals and their examination by the judges, it will be seen that the managers of the Exhibition have provided the means of giving its due prominence to this very important department of the Agricultural Exhibition.

Special series of live stock exhibitions have been provided for as follows: Horses from September 1st to September 15th; neat cattle from September 20th to October 5th; sheep, swine, dogs, from October 10th to October 25th; poultry from October 25th to November 10th.

Persons who intend making entries for this exhibition should do so without delay, in order that the managers may be able to estimate the number of stalls and extent of other preparations that will be needed. In the large Agricultural Exhibition Building, though it covers ten acres, so many applications for space have been made by exhibitors of agricultural products and machinery as to necessitate an enlargement of the original plan. The display of live stock is likely to be no less popular; and those wishing to participate in it, even though their applications may require future amendment, should lose no time in communicating with Mr. Burnette Landreth, Chief of the Bureau of Agriculture International Exhibition, Philadelphia.

The Live Stock Interests.

The *National Live Stock Journal* illustrates the importance of the interests which it represents by referring to the fact that in Chicago last year the aggregate shipments of live stock and dairy products amounted to $115,750,000 while the shipments of all other farm products amounted only to $81,650,000. The live stock, according to these figures, represented about one and a half times the value of everything else included under the general term of agricultural products. The *Live Stock Journal*, having thus established the importance of the live stock interests, proceeds to make complaint because accommodations are to be provided at the Centennial Exposition, for only seven hundred head of cattle—a number which it considers altogether too meagre for a fair representation on the part of the country at large, as state exhibitions frequently elicit one-half or two-thirds as many. The *Country Gentleman* does not consider the complaint a just one; and believes that, taking into consideration the distance to be traveled and the expenses to be incurred, together with the fact that great care will be taken in the selection of competing animals, it is not likely that the entries will largely exceed the number mentioned. However this may be, we shall certainly have a better representation of our live stock interests by the exhibition of a limited number of the finest animals than by getting together a multitude of only average excellence. This sifting process is a good thing in this, as in many other matters.

Jersey Cattle Sale.

There takes place occasionally a sale of this favorite class of stock where the purchaser can get great bargains and first-class stock at the same time. On the 7th of October, Messrs. Isburgh & Walker of Boston sold at auction fifteen head of Jersey cattle belonging to W. J. Cook, of Foxboro. There was a good attendance of gentlemen, and he following shows the prices paid: Bull—Towanda dropped at sea Oct. 20, 1872, $50. Cows and heifers—Eva Le Sueur, imported, six years old, $55; Gravelotte, imported, six years old, $82 50; Alice, imported, five years old $72 50; Victoria, four and one-third years old, $125; Artless, imported, four years and five months, $42 50; Ripple, imported, five years old, $102 50; Jessie, six years old, $127 50; Skylark, imported in dam, dropped Nov. 26, 1872, $80; Artless second, imported in dam, dropped July 25, 1873, $50; Bergerette, imported, nine years old, $27 50; Clover, dropped Oct. 3, 1873, $85; Ivy, dropped Oct. 7, 1872, $87 50; Lilley dropped Nov. 29, 1874, $25; a heifer dropped Dec. 12, 1873, $32 50.

Jerseys ought to bring better prices than these and we are surprised that their friends didn't rally in greater numbers and bid with greater enthusiasm.—*Mass. Ploughman.*

Embargo on Cattle.—The Secretary of the Treasury has addressed a circular letter to all Collectors of Customs in the United States, announcing that no importations of neat cattle or hides will be allowed from England from the date of the order November 3d, in consequence of the prevalence of the mouth disease in that country.

Take Care of the Implements.—Don't leave your implements out in the weather. A great many farmers are too remiss about this important matter. They do not often see beyond the first cost of new tools, forgetting the constant accumulations of interest which roll up into vast sums. Costly machines and tools are often injured more by exposure to sun and storm, than by use.

Mr. Stuyvesant's Sale.

The clearing out Ayrshire sale of Mr. John R. Stuyvesant, at Edgewood, near Poughkeepsie, N. Y., Oct. 20. The same that was advertised in the California Agriculturist and Live Stock Journal. Attracted a very good attendance of breeders, some coming from considerable distances. Competition was at times rather slack, but only one animal—the grand old monarch of the herd, Robbie Bruce—was sent out of the ring for want of an offer; and while five lots were knocked down to the first bidder, competition on several of the others was very animated. The condition of the cattle certainly indicated no attempt at getting them up for exhibition. Secretary Harrison of the New York State Agricultural Society acted as auctioneer, and effected sales as below:

Cows and heifers sold from $50 to $200 each. Bulls and bull calves $40 to $155 each Summary—41 cows and heifers, average, $89-90. Total, $3,685. Five bulls and bull calves, average, $58 00. Total, $290 00. 46 head, average, $86 41. Total, $3,975.

Sheep and Goats.

The Angora Goat Fleece.

The number of these goats now in California is larger by many hundred than last year, and importation is increasing. As to the disposal of the fleece there is no longer any question. The Sacramento *Bee* is reliably informed that "every pound of fleece in the State can find a ready market in New York at ninety cents or one dollar a pound, and the average yield is four pounds per head. These animals are well adapted to mountain sections, as they can subsist where sheep would starve.

The Angora Goat Breeder's Association have been at great trouble and expense in obtaining thoroughbred animals for this coast and the result of there labors will soon be made apparant.

We notice the establishment of an enterprise in San Jose which is the commencement, we hope, of an extensive business. The Angora Robe and Glove Company have commenced the work of tanning, drying and manufacturing leather, wools, gloves, robes etc., making mats, carriage robes, armlets, boot tops, collars and many other saleable articles from the skins and fleeces of the Angora. There will never be any lack of market for so valuable a staple as mohair, nor will the business ever be overdone. In a few years the State will be stocked with a class of goats almost pure bred the result of breeding together thoroughbreds and high grades, and the higher the grade becomes the more valuable will be the fleece.

In the late fearful storms in France, 596 sheep were killed at Belle Coste by one flash of lightning. They belonged to a flock of 1,800, the property of a farmer. His loss amounts to 18,000 francs. About 2,000 were thrown down headlong. Two boys were just arriving with the shepherd's bunch, and they set to work with great presence of mind, to disengage the heap of carcases. Many others must have died from suffocation but for this help. Some of the incidents noted are curious. The shepherd had his *sabots* broken, while one of his gaiters was struck off, and has not been found. The man was unhurt, but much shaken. His dog was lying between his legs when the bolt fell; it carried the body twenty yards, and twelve carcases of sheep were found piled above it.

Now is a good time to subscribe.

The Cashmere Goat.—Here it will be in place to say a few words concerning that beautiful and interesting animal, the Cashmere goat, with its fleece like a summer cloud, wavy and long and shinging after a rain, like white-gold satin. William M. Landrum says in his pamphlet on the subject that there are already seventy thousand animals in the State with more or less of this noble blood in their veins. Always hardy and healthy in this climate, clean as a cat, inodorous, never deserting its young like the base Spanish goat, contentedly browsing on chaparral, pine, poison oak, and a hundred things, where even the little merino would die, never so happy as when picking moss off a rock or a decayed log, never getting lost like the stupid sheep, but always cleaving to its fellows and always coming to the corral at night of its own accord, yielding the purest milk of all animals, which is never bitter, no matter what the goat eats, with flesh sweeter than mutton and mohair twice as valuable as wool—this little animal is one of nature's priceless boons to the poor man. It thrives wonderfully on the thinnest, rockiest farms on the foot-hills, where the miners have peeled off the top soil, and, in my opinion, it is destined to be the regenerator of those very regions, otherwise beyond hope. In addition to its beauty and its value, if indulged by its master with a casual handful of grain or salt, it will become greatly attached to him, and distressed when he is out of sight, running and bleating in quest of him.—*Stephen Powers in Atlantic Monthly.*

Wool in Colorado.—A correspondent of the *Economist* writes that wool growing is destined to be one of the heaviest and most important interests in this territory. There is no location in the country better fitted for sheep. The climate is mild, and in most cases the sheep graze the year round. The water is abundant, and the bunch grass in the valleys is very nutritious. Few lambs die in the fields, and there are no diseases among the sheep, and never has been in this territory. While in the southern and western portions of the territory, I saw many large flocks of sheep, numbering thousands. I was surprised at the number of lambs, which seemed to be equal to the sheep. The wool here is very clean and entirely free from briars, burdocks, etc.

One of our exchanges state that samples of wool were on exhibition at the Crystal Palace New York, not long since, for which a premium was awarded. The same beat all competition of the old world. It took Mr. Bicknell three years to produce this wonder, and cost a great deal of pains and labor, braiding the wool and tying it over the sheep's back. The fibres of this wool are probably the longest ever grown before or since, being about three feet in length. It was estimated by good judges that the fleece would weigh from forty to fifty pounds. The fleece was finally sold to a showman and brought the owner the nice little sum of five hundred dollars.

A New Breed of Sheep.—William Crozier, in charge of an extensive farm on Long Island, is endeavoring to establish firmly a new breed of sheep, produced by crossing Cotswolds and Southdowns. He has produced says the *American Agriculturist*, a sheep with a fleece of heavy combing wool, superior in quality and equal in weight with that of the pure Cotswold, and with as good quality of flesh as the Southdown, and one-half greater size.

Lloyd Smith, of San Joaquin county, California, has offered Mrs. Robert Blacom, of Centreville, $1,000 each for three French Merino sheep, which he proposes to take to the Centennial Exhibition of 1876, for competition with the best sheep from all parts of the world.

That Flock of Goats.—We noticed some days ago the passage of a flock 2,500 goats through Napa on their way to Mendocino via Santa Rosa, since which time the Sonoma *Democrat* has gained the following information concerning them:

In the band there was 500 thorough-bred Angoras, that will clip five pounds each on an average, in February, and the proprietors, Messrs. J. W. & E. L. Reed, informed us that they had the Spring clip sold in New York for $1 50 a pound. Among the thorough-breds are five bucks imported from Asia. The Messrs. Reed will take their flock to Pine Mountain, eight miles east of Cloverdale, where they have purchased sufficient pasture land to graze them. This is the largest and finest flock of Angoras on this coast. Mr. Reed informs us that there is a good market for Cashmere wools. Messrs. Reed purchased the band from E. R. Marsh, a banker of San Francisco, and paid $22,000. Mr. Marsh paid for the same band, exclusive of the spring kids, $27,400. There are five thorough-bred Asiatic bucks in tha band, two of which were presented to a Mr. Chenery, of this State, by the Sultan of Turkey; also, eight thorough-bred Cashmere and thirteen Angoras from the celebrated Alexander Blue Grass farm in Kentucky; also, sixty-four full-blooded mannes from the same place—making the most celebrated collection of the kind on this coast, or the United States, quality and quantity considered.—*Napa Register.*

A Cure for Hoof-Ail.—Richard Peters, Jr., Georgia, writes to one of our contemporaries as follows: During the Fall of 1869 we purchased some high priced Merino ewes in Vermont. On their arrival here they inoculated our entire flock with that fell discase, the hoof-ail (Randall). In a flock of 200 Merinos and 100 Angora goats, it had almost full sway for four years, notwithstanding constant and almost daily applications of blue vitriol, sulphuric acid, pine tar, oil, etc., and over $75 worth of crude carbolic acid. Nothing would cure it permanently. We finally thought death would be the best, and last remedy. However, our shepherd suggested nitrate of silver, used in very strong solution. It has proved an effectual cure, and for three months we have seen no sign of the foot rot. We applied by inserting a quill in a cork and wetting all parts of the foot with the caustic solution; then applying a little powdered lowat alum between the feet. Of course the foot must be trimmed, and the remedy applied once each week. Stables should be kept clean and sprinkled with lime. Pastures should be changed until the fall rains wash the pus from the leaves and grass. I hope this remedy will prove as valuable to other sheep breeders as to us. When sheep are infected with hoof-ail, they neither grow fat nor breed well, neither do they shear heavily.

Sheep Killed.—Another singular disaster occurred to a flock of sheep in Washington township recently, by which fifty-three of the animals were killed. The Alameda county *Independent* says the shepherd attempted to drive the flock of about 2,000 in number to a new pasture field in the neighborhood of Mission Peak. The ground in here much broken by gullies and deep ditches, and a portion of the sheep, frightened by some unknown cause, turned back and tried to reach their old pasture. While hurrying helter skelter, one sheep fell into a deep ditch, and before the could be turned several hundred and followed. On extracting them, fifty-three were found to have been killed or so badly injured as to necessitate putting them to death.

At the first meeting of the creditors of the Yuba Plough Company at Boston, October 29 it was decided that the company should continue business. The creditors will either grant an extension or the company will avail itself of the offer of responsible parties to furnish the ready cash needed.

The Vineyard.

Raisin Culture.

W. A. SANDERS, a gentleman who is widely known as the "raisin man," in Fresno county, writes to the *Expositor*, of October 10th, a valuable communication, in which he gives information as to the value of one year's product from one acre of raisins, from which we take the following:

I have in a single instance made forty pounds of raisins from a single vine pruned in the usual manner of vineyard pruning. These raisins sold at a country store, retail for twenty-five cents per pound, or $10 per vine for the year. An acre of land would produce 700 such vines, giving a gross income of $7,000 per acre. But this is a result far above what anybody must expect from raisin production.

An acre of grapes of the Larga, Tokay, Fiher Zagas, or what brother Wells calls the "White Malaga," will produce in our superior climate and from our best soil, with an abundance of water and good culture, on matrue vines, from 10,000, to 40,000 pounds of grapes per annum. Gen. Negley gathered from an acre of six-year-old Reisling vines, at San Jose, 40,000 pounds last year. There is no reason why vineyards in our county should not do as well.

You will observe that I do not use the term "drying." Raisins are cured not dried. Every person who has examined the qualities of raisins has observed that instead of the juice living been merely expelled in the process of curing, that it has been changed to glucose or grape sugar, and that instead of the raisin being but dried fruit-fibre, as is the case with dried apples, plums, peaches, etc., that is almost a solid mass of granulanted sugar. And just in proportion as this change of the juice to sugar is affected with least loss of weight is the grape suitable for making raisins.

The Larga loses 50 per cent. in curing; the Tokay 60 per cent., and other varieties, including Muscats, from 60 to 70 per cent. Or in other words, 1,000 pounds of grapes will make 500 to 750 pounds of raisins, according to the variety of grape used. You will thus observe that the amount of raisins per acre will range from 3,000 pounds of a light crop of Fiher Zagas to 20,000 pounds from a heavy crop of Largas. From this it is easy to determine the amount of cash from an acre.

And right here we wish to have it borne in mind that we are writing about "raisins," not the tough, ill-flavored, hard-seed dried grapes made from Catawbas, Mission, Zinfiadels, Sweetwaters, Hamburgs, or any other wine, table grapes, or trash that happens to be growing on the farm; but *raisins*, fine, large, bright, bloom-covered, plump, luscious, sugary raisins. And for such, when once they become known to the world, we do not think that we are over-estimating the price when we assume that we can only rely upon receiving at least ten cents per pound for them delivered at the railroad. That the sales will amount to from $300 to $2,000 per acre, gold coin. I have data of the positive character which leads me to rely upon clearing $1,000 per acre annually from my vineyard, when in full bearing.

To plough the ground well, construct distributing ditches, furnish the best of cuttings on the ground, and set them in the best possible manner, is worth $30 per acre. The care for the first year, irrigating, etc., would be about the same as for corn—say $10 per acre. Added to this after the first year, is an additional expense for pruning, or a total cost yearly of about $15 per acre. In addition to this there is the cost of picking, curing and packing, which makes a total of about one-half per cent per pound for each pound of cured raisins, not reckoning the cost of boxes, which would be an additional expense, and could be made to amount to much or little, according to the manner in which they are packed.

And now let me use your columns to answer a few questions that are constantly being intruded upon me from my reputation of being the "raisin-man" of the country.

WHY I AM HERE.

1st. Because all the vineyards of our valley can be so arranged as to be flooded. And this, when practiced judiciously, is a sure cure for the phylloxera and other ailments of grape vines.

2d. Because the summer heat here is sufficient when fully utilized by properly constructed drying floors, not only to speedily cure the raisins, but to destroy all insects there may be in the grapes, thus insuring the raisins against injury or loss by insects, and relieving us from the expense of scalding, steaming, or running thorough an Alden dryer, or any other patent process, as they are compelled to do where summers are less hot than in our valley. In this respect we surpass every other part of the State.

3d. Grapes ripen earlier here than elsewhere, and the fall rains are lighter and not so early as in most parts of the State, thus giving us the benefit of a greater amount of heat and greater dryness of atmosphere than is found in other localities, thereby enabling us to cure raisins so as to produce a quality that shall surpass anything that can be produced under less favorable conditions of temperature and dryness of atmosphere.

4th. The railroad, affording easy and speedy transportation to the city; and the prospective canal, which I hope to see built, and which will give us very cheap freight to the to the seaboard by the time our vineyards shall produce more than a local supply and a supply for the mining region east of the mountains.

5th. The superiority of our land for grape production and the ability to raise here oranges lemons, limes, pine-apples, and most other tropical fruits, in conjunction with our vineyards.

QUESTIONS AND ANSWERS.

What is the best soil for grapes? Any of the valley land that is not to sandy, is not alkaline, and has a depth of soil ranging from four to ten or fifteen feet above the hardpan.

Will almonds and alfalfa grow on such lands? Yes, both to perfection.

What can good vineyard land be bought for? From $2 50 per acre up to $20, according to location. But none of it is worth a cent without water.

What is water worth? Whatever the Fresno Canal & Irrigation Company choose to ask for it. They claim all the water of Kings river and their right of ownership has been confirmed by the Courts. They are now selling rights to irrigate 160 acres at from $250 to $500 each, the purchaser to construct his own ditch from their canal, and to pay from $25 to $100 annually for keeping the ditch in repair.

The *American Grocer*, of New York, is doing a great service for the raisin interest of California. Every number of the paper contains some favorable comment, and now if our people will put themselves in a position to supply the demand which is likely to follow the eminent endorsement which our product is receiving, the raisin crop will soon become of more importance to our agriculturists than the cereal now is.

California Dried Fruit.

The following which we take from the *Bulletin* of October 8th, gives a timely hint to the fruit raisers of the State, which we trust they will profit by:

A citizen of this State, largely interested in fruit raising, who has recently returned from New York, says that the inquiry for California dried fruit is on the increase.

The New York fruit market is a very large one. It can probably trade ten times as much dried fruit at a good price as California will be able to produce. But fruit growers here must study the market. Moreover dealers in New York want some assurance that when they sell a lot of California dried fruit, and find that the same pleases their customers, other lots of the same quality can be furnished in a steady way to supply the demand created. Unless that can be done the trade would be injured, and would be quite unsatisfactory. If for instance, a New York dealer were to sell an invoice of California raisins, he wants to know that he can keep right on selling the same. And so of dried peaches and plums. If he sells to-day a brand of Malaga raisins, he knows that he can stalk his store to-morrow with another lot, or with any other kind of dried fruit which is well known in the market.

Now these considerations are of great importance to California fruit-growers. A few odd lots put up in variable packages will never make much impression on the market. The dried fruits of this State are so good that the demand for certain sorts would be without limit, if care is taken to put them into the market in such packages as are provided by the trade.

If a fruit-grower this year could have had fifty acres of Bartlett pears in full bearing, and fifty acres more of apricots for drying, he could not have asked for a better thing. He could have shipped all his pears or sold them on the trees to others at round prices. His apricots, which could be sun dried at small cost and little trouble, would have brought very large prices in the Eastern markets. These may serve as hints of the direction in which fruit-growers may hereafter find profitable ventures.

Hay and Grain.

GRAIN CULTURE IN CALIFORNIA.

ALTHOUGH grain growing as conducted in California, is too often a hap-hazard business, it has nevertheless been reduced to a system in some localities, upon a paying basis. The best grain growers are not always the largest, in fact they are usually farmers who believe in and practice a diversified system of farming, at least to the extent of rotating from grain to hay and pasturage, with occasional summer fallowing, governed of course by local conditions of soil and climate. Many portions of the Santa Clara Valley crops can be grown every season without fallowing. Cropping to hay and pasturage occasionally, is more economical and every bit as good to clear the land of foul stuff and insure a good crop of grain the following season. On some of the rich soils in the interior valleys, a different system is necessary. The soil must be left fallow every other year, to be sure of bringing a crop worth harvesting. On an average the earliest sown grain is the best throughout the State, but even in this there are exceptions. On our rich moist soils, early sown grain will lodge before ripening and rust badly. Spring sowing on such soil is best, excepting in very dry seasons. The prudent farmer on such soils will always sow some grain early, and make hay if the season is unfavorable for grain, and sow a portion of his farm later, that he may have a crop of grain if the season is a wet one, or make hay and pasture if it turns to be a dry season. There are many little things that farmers in different localities have learned by hard experience about grain growing in their particular localities that is incalculable to them. Grain growing is but one branch of farming to be sure, and it is generally thought that a man does not need much experience or thought to sow and reap. But it is an important item in this State to grow a good crop of grain or hay, and probably as much hard work is needed to be successful in this one year with another, as at any other branch of farm industry. So far we have only referred to growing grain without artificial irrigation, where more or less guess work has to be done. With any system of irrigation, where the soil can be supplied with moisture to produce sure crop, less close calculation has to be done. But even then the cultivation of the soil is an important matter. We believe that for grain Winter irrigation is the best always. As to cultivation, our grain growers are very generally of the opinion that thorough—not deep cultivation is the best upon almost any soil.

In a recent article in the London *Times*, Mr. James Caird, after showing that the British harvest of 1874 is deficient, gives some figures showing the effect in Great Britain of a plentiful harvest in 1874: The benefit to consumers in this country of a good harvest, can now be definitely stated by the realized result of that of 1875. This is the only country in which foreign corn can always meet with a market, and in a year such as the past, the abundance of all foreign countries found this the only outlet. The weight of foreign corn of every kind imported during the last two harvest years has varied extremely little, being in round numbers 4,500,000 tons and 4,600,000 tons respectively. The cost of this in 1873-4 was £54,000,000, and in 1874-5, £45,000,000; the larger supply of the past year thus costing about 9,000,000 less than the somewhat smaller import of the previous year. To this difference must be added a considerable saving both in the quantity and price of foreign potatoes imported. When we add the saving in the cost of the home supply corn, the total gain to the British consumers from the fine harvest of 1874 can not have been less than £20,000,000.

Bermuda Grass Hay.—We have frequently been asked writes our *Home Journal* whether Bermuda grass, (so much esteemed for pasture and lawn), can also be made into good hay; and we have always answered, that where the soil is rich enough to produce a rank and heavy growth, there can be no question of the value of this grass for hay and forage. In corroboration of our views, we find the following suggestive item in a late number of the Atlanta, (Ga.) *Constitution:* One of the largest farmers of Greene county, Ga., Dr. Waldemar Moody, is devoting his entire attention to native grasses and stock-raising. He has seventy head of cattle, and the first cutting of his Bermuda grass crop yielded 125 tons of excellent hay. He expects to gather fifty tons more. This crop was secured at little expense. The doctor is very well satisfied with his abandonment of cotton culture. He does not propose to return to it. Grass and stock-raising pay better. A few such men in every county would happily revolutionize our agriculture.

The Wheat Crop of 1875.

Everybody knows that times are hard and that business of all kinds is dull. On the whole the farmers have had the best of it for a year or two past.

The general good condition of our wheat crop is an important element in the calculation as to the probabilities of the future, and that gives some encouragement to look for better times. We shall have a surplus to export and the world will certainly want all it can spare. According to Mr. Alexander Delmar the average requirement, supply, and deficit for many years past in the different European countries are shown in the following table, in which the foreign weights and measurements are reduced to bushels:

Country.	Requirem't.	Supply.	Deficit or Surplus.
United K'gdom	180,000,000	95,000,000	85,000,000
France.....	295,000,000	277,000,000	18,000,000
Austria.....	88,000,000	106,000,000	18,000,000
Russia.....	150,000,000	212,000,000	62,000,000
Germany.....	120,000,000	120,000,000	...
Roumania ...	15,000,000	30,000,000	15,000,000
Totals ...	858,000,000	840,000,000	18,000,000

The table shows an average deficit in the European wheat crop of 18,000,000 bushels, which has been made up by importations. For 1875-6, however, the deficit is estimated at 49,000,000 bushels, a careful estimate given the following table:

Country.	Requirem't.	Supply.	Deficit or Surplus.
United K'gdom	188,000,000	81,000,000	107,000,000
France.....	277,000,000	272,000,000	5,000,000
Austria.....	92,000,000	89,000,000	3,000,000
Russia.....	155,000,000	215,000,000	60,000,000
Germany.....	125,000,000	115,000,000	10,000,000
Roumania....	15,000,000	25,000,000	10,000,000
Totals ...	852,000,000	803,000,000	49,000,000

To meet this deficiency we have a surplus of about 65,000,000 bushels, the total crop being 265,000,000 and the home supply 200,000,000. At an average of 70 cents per bushel for the producer, this would amount to $45,000,000.

These figures show that the raising of wheat for export is a very dangerous speculation, and that while in some cases it may pay, the chances are that it will not. The slender average deficit of 18,000,000 bushels in Europe may at any season be turned into a surplus.—*New England Farmer.*

The Sacramento Beet Sugar Company. The *Record-Union* of October 30th has the following in regard to one of Sacramento's enterprises: "The Sacramento Valley Beet Sugar Company have about completed their manufacture for the year, the result being about 300,000 pounds obtained from about 3,000 tons of beets. The ground planted this year yielded four and a half tons to the acre; the beets 11½ per cent. of sugar. At Davisville the beets lacked moisture, and were burnt up by the sun. The cost of transportation from that point was $5 per ton. The company have secured 1,400 acres on the Cosumnes, near McConnell's, and 200 acres of American river bottom for the operations of next year. No more will be planted at Davisville. The plowing will commence as soon as possible, say about January, if the rains prove propitious. A dividend will be declared this year for the first time since the establishment of the factory."

A New Fodder.—We want new grasses in California now that irrigation is beginning to interest us. They are now introducing into Great Britain what is called the prickly comfry, a native grass of the Caucasus. It yields in several cuttings thirty tons to the acre, the grass is propagated from the roots and is perennial. Cattle eat it readily and thrive upon it. There is reason to believe that it will suit our climate.—*Southern California.*

Short Crops East.

The agricultural returns says the San Francisco *Bulletin* received at the Washington Bureau up to October 1st, shows a great shortage in the wheat crop of this year. The quantity in bushels is but 80 per cent. of the crop of 1874, and the quality is 14 per cent. "below a sound condition." We do not know whether this reckoning includes California and Oregon. If it does then the shortage for the whole country foots up 62,000,000 in quantity, and other millions in quality, and ought to have the effect of advancing prices in Liverpool. For the year ending June 30, 1874, the United States exported wheat to all countries to the amount of 71,039,928 bushels; to England, 60,551,181 bushels. This, of course, was the harvest of 1873, which was a heavy one. The British imports for that year from all other countries were not nearly equal to those from the United States, and the average price for the year ending September, 1874, was $1 84 per bushel. With a shortage as to quantity and quality of not less than 80,000,000 bushels in the United States this year, prices in Liverpool are likely to rule higher than they are now before the opening of Spring, notwithstanding the considerable supply of old wheat on hand. The barley crop is rated 13 per cent. and the corn crop 4 per cent. short of last year's production. Oats is the only cereal crop that shows an increase. The agricultural returns for October show that the wheat crop the present year is a short one, and there is a marked depreciation in the quality. The average thus far reported is 80 per cent. of last year's production. If this indicates the total depreciation, it amounts to nearly 62,000,000 bushels and gives the crop at 246,000,000 bushels. In quality the crop averages 14 per cent. below a sound condition.

Apiary.

Pacific Coast Bee-Notes, From American Bee Journal for November.

In answer to questions, we report as follows: 1. No surplus honey. Increased from 78 to 101 swarms.

2. There is no prospect for surplus honey; but enough to keep busy during the winter for their own consumption.

3. White sage, buckbush or berberry, sumach.

4. White sage blooms in April. The berberry blooms several times during the Summer. It is now in blossom in our canon for the fourth time since April. Sumach generally begins with August and lasts a month or more. Our ranch is within the frost-stricken belt (frost of April 5th), which accounts for the poor return. Brune & Bruck.

Los Angeles, Cal., Sept. 17, 1875.

1. Very good. Hives that did not swarm gave me one hundred pounds box honey. My stock hives all gave two swarms each, and some of them gave three.

2. No more surplus honey this season: my bees being kept in the city, I have not the benefit of buckwheat.

3. Dandelion, fruit and white clover.

4. Dandelion blooms April 11th; fruit blooms about the last of April; white clover blooms May 10th, and continues until about August 1st. Thos. Brassel.

Portland, Oregon, Sept. 18, 1875.

In compliance with your request under special; 1. We have had but few swarms, and from 200 hives we have taken only 32 pounds of honey.

2. We only expect to divide and make swarms.

3. Mountain clover, white sage and buckwheat are the three best honey-plants. Mountain clover begins to bloom the last of March and continues till the middle of May. White sage begins May 1st and continues until July. Buckwheat begins about June 1st and continues till the last of October.

Geo. B. Wallace.

San Bernadino, Cal., Sept. 18, 1875.

Pasturage for Bees.

With the exception of an occasional gathering from honey-dew, bees gather the whole of their honey from flowers, and consequently where there are no flowers they cannot thrive. But the term flowers must be taken in a broader sense than meaning such as we cultivate for garden ornaments or home decoration. The inconspicuous blossoms of many trees, the wee modest wild flower, scarcely noticed by passers by, furnish abundant pasturage for bees. Many persons who have lived in the country all their lives, are scarcely aware that our noblest forest trees have flowers at all, but from the brave old oak and the wide spreading beech, bees gather many a pound of honey. An avenue of limes or sycamores, a field of beans or white clover, form a very El Dorado for the busy bees, their pleasant hum on the snowy hawthorn or the sweet-smelling sallow, (palm, as it is commonly called) is very noticeable when nature is awakening from the gloomy sleep of winter, and our thoughts and feelings are glad with the prospect of returning summer. Where large heaths abound the bees have a second harvest, and it is a common practice in such localities for bee-keepers to send their hives to the moors for about two months, the trouble and cost being amply repaid by the immense weight of honey brought home, which the common heather yields freely during August and September.

In Scotland and on the Continent cartloads of hives may be seen traveling to and from the heather. Often they are looked after on the spot by some resident cottager who receives a gratuity of 1 s. per hive from the proprietors of the stocks. In the South of England this practice is not pursued, although I do not see why it should not be in many places, there being miles of heather equally available as in Scotland. On the Nile there are bee-barges which travel only at night, stopping in the day-time at any place that affords abundant pasturage for bees, and we read in *Pliny* that this was likewise the practice in Italy in his time. "As soon," says he, "as the Spring food for bees has failed in the valleys near our towns, the hives of bees are put into boats and carried up against the stream of the river in the night in search of better pasturage. The bees go out in the morning in quest of provisions, and return regularly to their hives in the boats with the stores they have collected. This method is continued till the sinking of the boats to a certain depth in the water shows that the hives are sufficiently full, and they are then carried back to their former homes, where the honey is taken out of them." And this is still the practice of the Italians who live near the banks of the Po, the river which Pliny instanced particularly in the above-quoted passage. It was the advice of Celsus that after the vernal pastures were consumed, the bees should be transported to places abounding in Autumnal flowers, as was done by conveying the bees from Achosia to Attica, from Eubœa and the Cyclad Islands to Scyrus, and also in Sicily, where they were brought to Hybla from other parts of the island. What portion of our fertile land does not afford sustenance for bees? Mr. Alfred Neighbor, in his work, "The Apiary," devotes a chapter to Bee-keeping in London. Could we ever imagine a more unpromising field for honey-gathering? London! Foggy, smoky London! But think a moment. London has parks, squares, gardens, and each of these has trees, flowers and shrubs. What matter if the flowers be dirty—their nectaries secrete the coveted sweet, and the natural filter of the bees will clarify it better than any artificial one could do. Only last year a lady living in Kensington told me she kept bees there. They throve well and had furnished her with a super of fourteen pounds weight. It has been asserted that bees will fly five or six miles for honey, if a supply nearer home be not attainable. They may, but such an extreme labor would not allow the stock to thrive. Too much time and muscular strength would be consumed in making the journey. The great danger to bees is their liability to be tempted into shops, such as grocers, confectioners, etc., where they get bewildered, fly to the window, and in a vain attempt to penetrate the glass, they die. Breweries are also fatal places, the sweet work attracting numbers which perish by drowning.

Most bee-keepers have a garden, and in it can be grown many flowers pleasing to the eye, grateful to the nose and useful to the bees.

Mignonette, borage, honeysuckle, hyacinth, crocus, laurustinus, lavender, lily, primrose and many other flowers are visited by bees, and may well be cultivated with advantage. The arable fields supply buckwheat, beans, mustard, clover and lucerne, which all give an abundant supply of honey; and if we follow America's example, we should sow, when possible, special bee flowers.

Borage has the reputation of being the best of all bee flowers. It blossoms continually from June till November, and is frequented by bees even in moist weather. The honey from it is of superior quality, and an acre would support a large number of stocks. Jewelers in the country cannot fail to have observed occasionally, that the leaves of the trees and shrubs have a gummy appearance and are sticky to the touch. If a leaf so covered be put to the tongue it will taste sweet. This is honey-dew, and is a secretion of some species of aphides, ejected from their abdomen in little squirting streams.

This substance the bees readily gather, and when it is abundant make large additions to their stores. It is generally most plentiful in June or July, and is chiefly found on forest and fruit trees, although often on low-growing bushes. At the season of its greatest abundance, the pleasant hum of the bees engaged on it is very audible.—*Manual of Bee-Keeping by John Hunter.*

How they Value Manure in Italy.

When driving out of Rome one day in an open carriage, the driver paused for a few moments at the outer edge of the city. Immediately opposite me on the left side there were two women with white aprons on a piazza, and in front of a house adjoining this several men were at work. Suddenly the younger of the two women came running to the carriage, as I supposed probably to speak to the driver before he started again. She, however, got down on her knees, extended her apron forward on the ground, and with her hands rapidly drew into it, fresh and clean as it was, a pile of manure just dropped. As soon as she had scraped in every particle of it, she gathered up the edges of the apron and went back with the load. I heard a laugh among the men, and on looking towards them, I saw one of them who had a bucket and shovel in his hand, and who had started to secure the manure. The time he lost in getting hold of his utensils enabled the woman, who was already equipped, to carry off the prize, and the laugh was wholly at his expenses.

I had a momentary feeling of surprise, but on reflection said, "this will pay." It would not, perhaps, require more than ten minutes of labor to restore the hands and the apron to a condition of cleanliness, while the article secured might be a dinner worth of vegetables for several persons.—*Travels in Italy.*

A Montana paper says: "M. Stone, living near Gaffney, cut this season 100 acres of wheat, some of which yielded fifty bushels to the acre. And yet people trudge off to California simply to raise wheat.

EXCHANGE NOTICES.

There are so many Agricultural papers of merit in the United States, that to give extended notices of them and their peculiar excellences, would require too much space. We will continue our list from month to month. Our readers can obtain sample copies of either of them by writing to the publishers, giving your address and enclosing a stamp to prepay postage.

We will remark right here, that sending a postal card to a publisher for a sample copy, is imposing on good nature. Publishers must prepay postage. They are willing to send a paper to any one who wishes to examine it, but are not generally so generous as to furnish postage stamps to strangers. Some publishers advertise that they will pay no attention to postal cards.

Commencing with the publications of the West:

Central Union Agriculturist

Is a semi-monthly, 8-page paper, the only agricultural paper in Nebraska, and published by Geo. Brewster, at $1 60 a year. Specimen copies, 10 cents.

The Kansas Farmer

Is a weekly, only agricultural paper in Kansas. Published at Topeka.

The Missouri Farmer

Is a weekly published at Booneville, Mo.

Coleman's Rural World

Is a weekly publication, by Norman Coleman, St. Louis, and is one of the most valuable papers on our exchange list. $2 10 a year.

The Journal of Agriculture

Formerly a monthly, now a weekly, is also an excellent paper, published at St. Louis, Mo.

Our Home Journal and Rural Southland

Is one of our favorites, published weekly at New Orleans, La., at $2 65 a year. We always find something in our Southern exchanges applicable to California farming.

The Rural Sun

Is an excellent Southern paper, published at Nashville, Tenn., at $2 50 a year.

The Rural Carolinian

Is a monthly publication, neatly gotten up in pamphlet form, at $2 00 a year. Published at Charleston, South Carolina. Send 20 cents for a sample copy.

The New England Farmer

Boston, Mass., is an excellent weekly, $2 50 a year. We can say the same of the

Massachusetts Ploughman,

Boston, Mass., $2 50. We should think that these two papers would join forces. But this is their matter, not ours; however, they are both valuable papers.

New York produces only about twenty-five agricultural papers.

State Agricultural Journal

North Carolina produces the State Agricultural Journal, a neat weekly at $2 00. Published at Raleigh, N. C.

The Rural Messenger

Petersburg, Va., weekly, $2 00 a year.

The American Farmer

Is another neat Southern monthly, published at Baltimore, Md., at $1 50 a year. 15 cents will obtain a single copy.

☞ *Enright's Foundry.*—Mr. Enright is now at work on quite a number of Straw-Burner thresher engines. He expects a big sale this coming season, as his engines give such splendid satisfaction wherever tried. We expect to see San Jose one of the leading manufacturing centres for agricultural machinery before many years.

☞ *Bergstrom Plows.*—We think that parties wishing to purchase good plows would do well to examine the Bergstrom plows on St. John street. (See advertisement.) These plows are made of superior steel with iron core, so as to give great strength and admit of case-hardened surface that dirt will not stick to and that will wear. We are sure they deserve notice.

☞ The National Gold Medal was awarded to Bradley & Rulofson for the best Photographs in the United States, and the Vienna medal for the best in the world.
429 Mantgomery street, San Francisco.

☞ *Good Work* is deserving of credit. Drs. Menefee & Gaston, dentists, San Jose, have lately done some excellent plate-work, difficult to fit, for the editor. In this age of imperfections, when Nature seems inadequate to provide substantial teeth for everybody, a perfect dentist is a perfect blessing. Good health demands sound, clean teeth, and for comfort alone it pays to keep the mill in one's head in good griudiug condition. This is our experience.

☞ *San Jose Foundry.*—This establishment, managed by Mr. McKinzey, proprietor, is turning out a good deal of agricultural machinery, and every year does more at it. We notice there the Harris Tubular Harrow, two kinds of excellent gang-plows of recent invention, an improved seed-sower, a new grain-cleaner for seed-wheat, etc., and the Pelton horse-powers. Mr. H. Mitchell, the foreman, informs us that they will soon enter more largely into the manufacture of improved farming implements, including threshers, engines, etc.

☞ From Bradley & Rulofson, leading photographers, San Francisco, we acknowledge the receipt of a handsomely finished photograph of the Palace hotel, including the opposite corners, also handsome models of architecture, one of which is designed for the business of these photographers, who will take their new stand on Market street, in the very heart of the business of the city. Attached to the card is a description of the hotel itself, by Professor Knowlton.

Berkshires For Sale!

FOUR EXTRA FINE PIGS,

3 Sows and one Boar pig, Pure-bred Berkshires, farrowed 19th of last April, by that superior, first-premium, breeding sow, America, and sired by first-premium boar, Young Comet. There are no finer bred pigs in the United States than these.

☞ For further information and price, inquire of the Editor of this journal.

Enlarged and Improved

THE FARMERS' STOCK JOURNAL,

Till it has no superior as a Farmer's and Stockman's Journal on the Continent; published on the finest quality of tinted book-paper, beautifully embellished with numerous engravings of Stock, the finest that artistic skill and taste can execute, at only $1.50 per year, postage paid. It is no new enterprise, being in its 5th Volume, thoroughly established, recognized and patronized by the leading stock men and farmers of the East and West. Gives Engravings and Biographical Sketches of leading stock men. The best paper in the country to advertise in. It does not claim hundreds of thousands of readers in order to deceive advertisers; but it does claim to reach, by bona fide subscription, nearly every agricultural State in the Union, and in many counties in Iowa its circulation exceeds that of the local press.

Send 10 cents for sample copy and you will like it. No attention paid to postal cards asking for samples.

ALEX. CHARLES,
Cedar Rapids, Iowa.

Farmers of Small Means

California holds out many inducements to immigrants of small means, who may wish to engage in farming. There are fine agricultural lands, still unlocated, in the coast and mountain counties, which are admirably adapted to a diversified system of tillage. The soil is unusually rich and fertile to the very summits, and even over the steep and rocky places there can be found good pasturage—Nearly all of this land can be broken up with ordinary plows and sown to the cereals and tame grasses, or cultivated in cotton, ramie, hemp, etc. Much of it is adapted to the growth of all the semi-tropical fruits. The Newark Land Association have recently placed their valuable tract of land (4,000 acres) in market, subdividing the same into small tracts (1 to 10 acres) for residence property, and 10, 20 and 40 acre tracts for farms—and will sell on very liberal terms to parties who desire to purchase at private sale, until the Grand Auction Sale, which will take place about the last week in November or the first week in December. This land is a perfect garden spot, and within easy reach of the city, and with a climate unsurpassed. We say, then, to farmers of small means, that California offers you inducements that no other State in the Union, or country in the world, can offer. Here you can lay the foundation of a permanent home, with the certainty of, at least, a competency, and, in all probability, a fortune. The Association has placed the whole management in the hands of Mr. Wm. H. Martin, the General Agent of the California Immigrant Union, 54 California street. **This Means Success.**

BOOK AGENTS and GOOD SALESMEN

No. 19 New Montgomery Street,

GRAND HOTEL BUILDING,

SAN FRANCISCO.

1776. CENTENNIAL 1876.

Chicago & Northwestern Railway.

Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their

Transcontinental Tickets via

CHICAGO & NORTH-WESTERN RAILWAY

This is the BEST ROUTE EAST.

Its Track is of STEEL RAILS, and on it has been made the FASTEST time that has ever been MADE in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fort Wayne and Chicago and Pennsylvania Railways.

2 THROUGH TRAINS DAILY, WITH PALACE 3 Cars through to Philadelphia and New York on each train.

1 THROUGH TRAIN WITH PULLMAN PALace Cars to Baltimore and Washington.

Lake Shore and Michigan Southern Railway and Connections—New York Central & Erie Railroads.

3 THROUGH TRAINS DAILY, WITH PALACE 3 Drawing Room and Silver Palace Sleeping Cars through New York.

Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways.

3 THROUGH TRAINS, WITH PULLMAN PAL3 ace Drawing Room and Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

Baltimore and Ohio Railroad.

2 THROUGH TRAINS DAILY, WITH PULL2 man Palace Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the **Shortest, Best** and only line running Pullman celebrated **Palace Sleeping Cars and Coaches** connecting with Union Pacific Railroad at **Omaha** and from the **West**, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for **Chicago and the East.**

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through cars to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento. Tickets for sale in all the Ticket Offices of the Central Pacific R. R. H. F. STATWOOD, General Agent, 121 Montgomery street, San Francisco.

VINEGAR. HOW MADE IN 10 HOURS from Cider, Wine, Molasses or Sorghum, without using drugs. Address, F. I. SAGE, Vinegar Maker, Springfield, Mass.

THE TRUTH ABOUT

The DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE.

IT DOES NOT TAKE AN HOUR TO GET ready to do a minute's work, but is always ready in a minute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages: It prevents fulling or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Pleating.

The peculiar feature of DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor binding of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

For further information, circular and terms, call on or address
